As a matter of fact, the principal weapon being used by the NLM is the mounting of the literacy campaign in various districts. This means the involvement of the entire population to the extent it is possible. The government does what it can and so do different voluntary agencies including those connected with various religious denominations. The idea is to involve everyone. In Kerala in particular, the clergy of various religious communities helped a great deal. Indeed so did a large number of unemployed youth of both sexes. Unemployment is fairly widespread in the State. Once the campaign got going, they got drawn into it and quite a number of them did highly creditable work.

It may be recalled in this connection that a National Adult Educational Programme (NAEP) had been launched in 1978. For a variety of reasons it did not do all that well. A decade later it was rechristened as the National Literacy Mission? and given a new thrust and organisation. What the initial experience has shown is that, more than anything else, it is the campaign method which has proved particularly useful. The committee however cautions against applying this approach to all parts of the country at random. This is because levels of awareness differ in different States. Unless the local situation is assessed and corresponding adjustments are made, it will not be advisable to rush headlong.

There is no denying the fact that NLM has to some extent succeeded in placing adult

literacy on the national agenda. But literacy, the committee insists, should not be thrust on the learners. It should emerge as a felt need of the youth and it is only when that need expresses itself in a certain way that it should be met. This is a salutary piece of caution. What is even more salutary is another piece of caution when the committee observes that the universalisation of elementary education should be given top priority both in educational planning and resource allocation. Once that happens, no child in the early 90s would grow into an illiterate adult in the next century.

To some extent, something of this kind had been done in the early 50s too. Nobody had advocated such an approach, formally speaking. But in State after State, a kind of unstated decision came to be taken. In terms of it, the pursuit of adult literacy was abandoned in favour of diverting all attention to the improvement of schools. It so happened however that even that objective remained unfulfilled. In plain words, both the formal and the non-formal systems became dysfunctional. In reviving the earlier approach, however the committee has taken extraordinary pains to ensure that ECCE is made functional as well as effective. If that happens, this shift of strategy can produce good results. In brief, the whole experiment would have to kept under watch.

X

While the 1986 policy talked of vocationalisation, this committee goes much beyond that and brings in the concept of education and the right to work. This latter concept was projected by the National Front before the 1989 election and was also included in its manifesto. There was a good deal of discussion of the subject when the NF government was formed. But no concrete steps could be taken to ensure the achievements of this objective. Meanwhile all kinds of dissenting opinions were also expressed. The objective was regarded as unfeasible as to some extent it is.

What the committee however has done is to link it up strongly with vocationalisation. It starts by saying that the concept of vocationalisation as presented in the 1986 policy was linked to secondary education and no more. Its purpose was to enhance individual employability. Furthermore vocational education was seen as a distinct stream intended to prepare students for identified occupations. Vertical mobility for vocational graduates was to be provided through bridge courses and even a specific target (10 per cent of students at the higher secondary level by 1990 and 25 per cent by 1995) was fixed.

The committee is of the view that vocationalisation is not merely to "impart saleable manual skills but to relate hand with head and heart so that productive labour and socially useful work becomes a medium for developing creative intelligence and a knowledge base on which one could keep building throughout life". This is well put and recalls the fundamental insights of Gandhi, Tagore, Zakir Hussein and several others. Each one of them emphasised the

fact that one discovers oneself through the medium of work.

The committee is aware of the fact that this approach marks a complete break with the traditional approach. The existing class/caste attitudes militate against the adoption of such an outlook. What was more, the 1981 census counted almost as many as 2 crore technically qualified persons who were available in the labour force but almost 90 per cent of them were still looking for jobs. Clearly the problem is not as simple as it is usually made out to be.

It cannot be claimed that the committee deals with this problem adequately. To suggest that work experience or socially useful productive work should be linked with various other subjects both at the level of content and pedagogy is in order but does not go far enough. The issue requires to be discussed in much greater depth than has been done. It must be acknowledged however that the committee retrieves the situation somewhat by insisting upon one fact. According to it, classes IX to XII should be viewed as a distinct stage of education and instruction in the classroom should be planned for one, two, three or four years, as the case may be, in the academic or the vocational stream. There should be perfect interchangeability between the two streams and no artificial barriers should be erected. The principles of modular courses and credit accumulation can also be introduced.

In this connection, a reference is also made to how the Shramik Vidyapeeths, the ITIs, the polytechnics and the rural institutes function. Each one of them caters to the highly diversified employment market, both in the organised and unorganised sectors. There is one notable omission in the report and that relates to the institutional setup of agricultural polytechnics. Some innovative work is done in agricultural universities but how those innovations are to be disseminated is a somewhat neglected area. There was a brief mention of agricultural polytechnics in the Sixth Plan but there has been no follow up, and the subsequent plan did not even refer to the need for such polytechnics. This report also fails to do so. Except that it makes one important statement:

If the vocational courses are not meaningfully linked with the user agencies, empowerment for work would remain an idle concept. The isolation of vocational education from the employment market in the organised and unorganised sectors must be broken.

There is a brief discussion of the various models of vocational education. But much more important than that are two crucial recommendations made in this respect. One relates to how teacher education courses for vocational education at both the secondary and post-secondary levels should be re-designed. What is required is to avoid the "near exclusive emphasis on knowledge through theory alone". Secondly, the committee favours decentralisation of management, planning and implementation to the level of individual high schools or school complexes as well as colleges and universities. It would have done no harm had the

committee chosen to go into further details of some of the issues involved.

This is particularly important because the strength of this report lies in the way it has focused attention on programmes and activities at the grassroots level. The committee has also taken note of the size and magnitude of the vast unorganised sector and of the realities of social and economic life. Since that had been done it was all the more incumbent upon it to go into the issue of vocationalisation and the right to work in greater detail as well as concreteness.

XI

To go on with a detailed analysis of the rest of the report may be advisable but it is not important. Issues like higher education, technical and management education, languages in education, content and process of education, teachers and students, decentralisation and participative management and resources for education are gone into in the remaining chapters. Quite a few of them have some interesting and significant things to say but what may be described as the core of the report comes to an end with page 217. This point of view needs to be further explained.

The chapter on higher education is one of the more brief chapters in the report. It advocates selectiveness in admissions, new management for universities, the importance of extension and research, curriculum development and so on. Autonomous colleges are also supported. Most of these things are a rehash of what was contained in the 1986 policy or even earlier documents. But there are a couple of things which need to be referred to either because reiteration by the committee is helpful or because certain new initiatives are suggested.

Two of the new initiatives proposed are restructuring of the UGC with at least five full time members, apart from the chairman and the vice-chairman, with specialisation in specific areas and tribunalisation of justice in centres of higher education as suggested by the Law Commission. In one important respect, the committee differs with the 1986 policy. It is not in favour of a National Council of Higher Education for, in its opinion, it would be some kind of a fifth wheel on the coach. On the other hand, the committee has suggested a two-tier structure, a council of ministers which would include those holding portfolios like education, agriculture, health, law, science and technology and a council of secretaries dealing with these subjects together with the finance secretary and the secretary of planning. The former body should be presided over by the prime minister with one of the ministers being a vice-chairman by rotation. The committee has also reproached the Central government for violating its own guidelines; a case in point was the establishment of Assam and Nagaland universities.

To enlarge upon any one of the other recommendations is not going to either break new ground or throw much fresh light on the issues that clamour for solution. In

UNIVERSAL INDUSTRIAL LEASING COMPANY INDIA LIMITED

Regd. Office: 'Nehru House', 4, Bahadur Shah Zafar Marg,
New Delhi - 110 002.

NOTICE

It is hereby notified for the information of the public that Universal Industrial Leasing Company India Limited proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under sub-section (1) of Section 21 of the Monopolies and Restrictive Trade Practices Act, 1969, for substantial expansion of their undertaking. Brief particulars of the proposal are as under:-

1. Name and Address of the Owner of the undertaking : Universal Industrial Leasing Company India Limited,
4, Bahadur Shah Zafar Marg,
New Delhi - 110 002.
2. Capital structure of the Owner organisation :

| | |
|--|----------------|
| Authorised | |
| 13 1/2 % Preference Equity | —Rs. 10 lacs |
| | —Rs. 200 lacs |
| Issued and Subscribed Preference @ Rs. 100 per share | Rs. 1008 lacs |
| Equity @ Rs. 10 each | Rs. 49.50 lacs |
| Paid up: | |
| 8 Preference Shares | Rs. 1008 lacs |
| 5000 Equity Shares @ Rs. 10/- | Rs. 50 lacs |
| 490000 Equity Shares @ Rs. 2/- per Share called up | Rs. 9.80 lacs |
3. Location of the unit or division to be expanded : 7, Council House Street,
Calcutta - 700 001.
4. In case the expansion relates to the production, storage, supply, distribution, marketing or control of goods, indicate
 - (i) Names of goods : Existing business of financing including leasing.
 - (ii) Licensed capacity/turnover before expansion : The turnover for the year ended 31st March, 1990 was Rs. 43.75 lacs approx.
 - (iii) Expansion proposed : Existing business by making further call on equity capital and issuing further equity shares effecting total addition of Rs. 91.18 lacs approx. to the existing paid up share capital.
5. In case the expansion relates to any service, state the extent of expansion in terms of usual measures such as value, turnover, income etc. : N.A.
6. Cost of the project : Additions to existing business as in item No. 4(i) above.
7. Scheme of finance indicating the amounts to be raised from each source :

| | |
|---|----------------------|
| The entire amount of expansion i.e. Rs. 91.18 lacs approx. will be made | |
| i) by making further call on Equity Shares | Rs. 39,20,000 |
| ii) by issuing further Equity Shares to Shareholders and Employees. | Rs. 51,97,500 |
| | <u>Rs. 91,17,500</u> |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

For UNIVERSAL INDUSTRIAL LEASING
COMPANY INDIA LIMITED

Place: Calcutta
Date: 18th June, 1991.

L.R. PURI
DIRECTOR

either event, these recommendations fall far short of what is required to be done.

The same thing can be said in regard to technical and management education. To say for instance that the IIT Review Committee Report should be implemented is neither here nor there. Similarly to advocate mobility and exchange of faculty between academic institutions, national laboratories and industrial establishment does not break any new ground. A whole series of steps to ensure cost effectiveness are suggested and something similar is enumerated even in respect of entrepreneurship development.

These suggestions are useful but do not add much to what is already known.

One particular proposal however which is linked with measures to check brain drain needs to be underlined. The committee advocates legislation to ensure that highly trained personnel put in three years of service in the country before they are allowed to go abroad. Something of this kind is happening in France. The recklessness with which we manage to export talent is unbelievable. While some of the other measures suggested are along conventional lines, this suggestion together with reference to what is done in France needs to be noted.

When it comes to the question of languages in education, the three language formula is reiterated. The difficulties of Urdu speaking people and the development of Urdu are dealt with in some detail. Something is said even in support of Sindhi and other inter-State languages. The need to develop Hindi as per Article 351 of the Constitution is underlined. Sanskrit too is not ignored and the decline of academic standards in this area is deplored. A new proposal has been made however and it relates to a fresh Linguistic Survey of India. 'The last one was conducted from 1898 to 1928. Since then things have changed a great deal and a fresh survey is called for.

In another chapter, there are useful hints about value education, educational technology, computer education, environmental awareness, sports and physical education, excessive emphasis on book learning and so on. An attempt to be comprehensive, so to speak! But what stands out is the suggestion that an Examination Reforms Commission should be established.

Whether it should be a commission or a somewhat lower level body can be a matter of opinion. Elsewhere in the report the role and potential of a National Testing Service has been reconsidered. It was suggested that it should be a development agency which is essentially engaged in research and renders certain specific services but it should not conduct tests in a centralised way. That is one point of view and it is as defensible as the opposite point of view. But why was it not possible to consider both proposals in an integrated form? In any case, the issue of examinations is touched upon but not explored in detail. In a sense, it is fundamental to a good deal of what is happening and should have been discussed much more thoroughly. Would not such a commission

duplicate and, to some extent, undercut the role and functioning of the UGC? This issue is not even raised.

There is another lacklustre chapter about teachers and students. One of the proposals relates to students' councils with the vice-chancellor as president. Any who knows anything about the working of the universities would not take long to recognise that the proposal is more unworkable than workable. It is odd that with half a dozen vice-chancellors on the committee, there was not that much pragmatism. Possibly the explanation lies in the fact that not many of them took a hand in the drafting of the report which was left essentially to the secretariat.

This unavoidably brief survey of approximately two fifths of the report serves to underscore the point that the core of what the committee did lay in the first 200 pages. For the rest, certain formalities had to be complied with, and those were complied with. If in the process, certain things were reiterated or a few new insights were projected it was as it had to be.

Even in the chapters dealing with resources and decentralisation and participative management, some of the things suggested in the earlier 200 pages are referred to again though some new important points are also made. One is the view of the committee which is not in favour of creating an Indian Education Service as advocated by the 1986 policy. Instead the committee advocates a cadre of educational advisers at the State level as in the Centre.

The second important recommendation made by the committee is that fees should be raised in such a manner that the richest quartile of the people bears 75 per cent of the cost of education, the next richest quartile bears 50 per cent and the one after that 25 per cent. The last of the economically weak quartile (to be appropriately defined) need not bear any part of the cost. While sound in principle, the proposal is not elaborated in as much detail as it should have been. Similarly in regard to loans and scholarships, something is said more or less in passing but the proposal is not elaborated as it deserved to be. Perhaps by then fatigue had set in and time was running out and so certain things were included but not dilated upon.

In any case, the chapter which deals with the question of resources is one of the weaker ones in the report. This chapter should have been drafted with greater care and with much more attention to detail. More than that, the linkage of education with the mode and process of planning should have been brought out. One of the weaknesses of all educational policy making bodies has been that they usually operate on their own and not in co-ordination with those engaged in planning. What it amounts to is more or less this; education ploughs a lonely furrow and, to that extent, remains isolated from the mainstream.

It was for these reasons that it was stated earlier on that the really valuable part of the report consists of the first 200 pages where

issues relating to equity and social justice are viewed in the background of the constitutional directive to provide compulsory schooling for children up to the age of 14. If in the years to come, this report is remembered, it will be for having broken new ground as far as education at that level is concerned.

XII

Finally, two questions may be raised. One was in fact raised quite early when it was affirmed that without a new ethos of work and a radical restructuring of the delivery system, most of the things suggested in the report would remain unimplemented. This is an aspect of the problem into which the committee has not chosen to go. It can be argued that it was beyond its terms of reference. This is valid up to a point and need not be dismissed out of hand. But then this is precisely what leads to the other related question.

Why is it that things recommended by the 1986 policy were not acted upon? Was it lack of funds? Was it the weakness of the delivery system? Was it lack of political will? Or was it some other explanation? Each one of these factors was responsible for non-implementation to some extent. If it was to be ensured that what was now being recommended should get implemented, it would have certainly helped matters if some analysis of the causes of non-implementation had been undertaken. A proposal like a National Council of Higher Education may require legislative action. But a proposal like Operation Blackboard which had some limited success could have been promoted with greater vigour only if more funds had been available. Not to have dwelt upon these issues is a real weakness of the report.

Members of a review committee should be free to talk about these matters. In this report, there is evidence of a certain independence of mind and boldness of assertion which is refreshing. In other words it was not for want of courage or assertion that the committee did not go into these issues. Presumably the committee did not feel too confident about what was likely to happen to its recommendations and, therefore, it chose to conform to conventions rather than stick its neck out.

What has happened since more or less confirms these apprehensions. Because of political instability, non-decision-making is the order of the day. But why should every issue wait upon political clearance? A large number of them can be decided at lower levels and are instances of decisions taken, or not taken, rather than of policy initiatives. It is time that at least those were taken. As of this moment, the union minister (in consultation with State education ministers) is to appoint a committee on behalf of the Central Advisory Board of Education and it is this committee which will go into this report further and decide what can or cannot be done. And so it goes on and on and on.

Notes forming part of the Accounts for the year ended 31st March, 1991

1. SIGNIFICANT ACCOUNTING POLICIES
 - (a) The foregoing/accompanying financial statements have been prepared on the historical cost basis and conform with the statutory requirements prescribed under the Banking Regulation Act 1949 as also with the generally accepted accounting practices within the banking industry.
 - (b) Foreign Currency Transactions
 - (i) Assets and Liabilities in Foreign Currencies are translated at the rates notified at the year end by FEDAI and contingent liabilities in respect of forward exchange contracts is converted at contracted rates.
 - (ii) Outstanding forward exchange contracts are revalued at the rates notified by FEDAI at the year end and resulting gains/losses on revaluation are credited/debited to Exchange Income account.
 - (c) Investments in Securities
 - (i) Investments in Government and other approved securities in India have been valued at the lower of Cost or Market value on a scrip by scrip basis.
 - (ii) Investments in Unapproved securities are valued at cost.
 - (d) Advances
 - (i) Provisions for Bad & Doubtful Debts are made based on periodic appraisals by Management of the portfolio which are in the satisfaction of the Auditors. Advances in the Balance Sheet are stated after deductions of provisions.
 - (ii) Provisions are made on a gross basis with tax relief being accounted for only in the year of write off.
 - (e) Fixed Assets
 - (i) Fixed Assets have been valued at Cost less depreciation. Depreciation is provided on the written down value method adopting income tax rates.
 - (ii) Fixed Assets had been revalued in the books of the Indian Branches of the Bank as at 1st January 1969 by adopting cost in respect of premises and income tax written down value in respect of vehicles furniture and fixtures.
 - (iii) Premises include shares in Housing Companies of Rs 5 064 347/ (previous year Rs 5 064 347) on which no depreciation has been provided.
 - (f) Staff Benefits
 - (i) The Bank has created separate Recognised Funds for Pension and Gratuity. Provisions for Pension/Gratuity benefits to staff have been made on an accrual basis as certified by the Actuary.
 - (g) Income Recognition
 - (i) Interest Income is recognised on an accrual basis.
 - (h) General
 - (i) The profit in the Profit and Loss Account is after accounting for inter alia provisions for tax, provisions for doubtful debts as also for the other usual and necessary provisions but before transfer to Reserves of the amount of 20% of profits prescribed by Reserve Bank of India.
2. Particulars of remuneration to Chief Executive Officer in India

| | | |
|--|------------|------------|
| | 31 03 1991 | 31 03 1990 |
| | Rs P | Rs P |
| Salaries and Dearness Allowance | 127 704 86 | 269 751 89 |
| Other Allowances | 9 540 00 | 6 660 00 |
| Bonus | 57 680 60 | 45 119 20 |
| Money value of other benefits and perquisites (including furnished accommodation utilities and car calculated according to the income tax rules) | 125 286 60 | 147 299 30 |
| Total Rs | 317 932 06 | 468 790 47 |
3. In respect of tax matters in dispute amounting to Rs 66 700 581/ upto the accounting year 1990 where the bank/tax authorities have preferred appeals no provision has been made in respect of these matters pending the final outcome of these appeals. However the amount of unremitted profits and Head Office charges withheld in India is more than adequate to cover the liability if any that may arise in this regard.
4. Previous year's figures have been regrouped wherever necessary.

Auditors' Report on the Indian Branches of Banque Nationale de Paris under Section 30 of the Banking Regulation Act, 1949.

We have audited the attached Balance Sheet of the Indian Branches of Banque Nationale de Paris as at 31 March 1991 signed by us under reference to this report and the relative Profit and Loss Account of the Indian Branches of the Bank for the year ended on that date.

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of sub-sections (1) (2) and (5) of Section 211 and sub-section (5) of Section 22 of the Companies Act 1956 the Balance Sheet and Profit and Loss Account together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act 1956. The accounts are therefore drawn up in conformity with the Forms A and B of the Third Schedule to the Banking Regulation Act 1949.

We report that subject to and read with the foregoing remarks:

(1) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of the audit and have found them to be satisfactory.

(2) The transactions which have come to our notice have been in our opinion within the power of the Indian Branches of Banque Nationale de Paris.

(3) In our opinion proper books of account as required by law have been kept by the Bank so far as appears from our examination of those books.

(4) The above mentioned Balance Sheet and Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account.

(5) In our opinion and to the best of our information and according to the explanations given to us the accounts together with the notes thereon and subject to note 1(d) (ii) dealing with fixed assets and note 4 with certain taxation matters under appeal give the information required by the Companies Act 1956, in the manner so required for Banking Companies and on such basis give a true and fair view in the case of the Balance Sheet of the state of affairs of the Indian Branches of the Bank as at 31 March 1991 and in the case of the Profit and Loss Account, of the profit of the Indian Branches for the year ended on that date.

Growing Regional Inequalities in Gujarat

Surendra J Patel

There are two Gujarats: one, the developed industrial belt from Gandhinagar to Vapi; and the other, the poor, agricultural parts of the State consisting of Saurashtra, Kachch and the north-eastern, eastern and southern districts.

The author sketches, with a broad brush, the outlines of the two unequal Gujarats and reviews past efforts, conspicuously unsuccessful, to deal with the problem of regional inequalities in the State. The note ends with a call for more vigorous policies to reverse the trend towards worsening regional disparities.

*Jyan jyan vase ek ek Gujarati
Tyan tyan sadakal Gujarati.*

—Khabardar

POET Khabardar had sung of Gujarat's universality. His Gujarati was one Gujarati. It accompanied a Gujarati wherever he went the world over. This was the poet's love for Gujarat—one Gujarati. But reality is not that simple. There are at least three Gujaratis, not one. One of them is inhabited by about one to three million Gujaratis living outside, in India and abroad. The other two Gujaratis are right here in Gujarat. One, the rich, prosperous, developed industrial belt from Gandhinagar to Vapi. The other Gujarati consists of Saurashtra, Kachch and the north-east, east and south districts. This Gujarati is relatively underdeveloped, poor, agricultural. It encircles the rich heartland of Gujarat.

For this coincidence of geography and development, I have called the richer heartland, the Centre, and the poorer encircling districts, the Periphery. Such extremes do not exist in Gujarat alone. Their existence is universal—in other States of India, in other countries and among groups of countries. The whole world is a divided world, an unequal world. Many names are used to describe this reality—the developed and the developing countries; the North and the South; the Centre and the Periphery; the rich and the poor countries; the industrial and the agricultural regions. Whatever the name employed, the meaning is the same—in the world, in India, in Gujarat Gujarat too is thus a mini-mirror of the unequal world.

I will try here to see what the Gujarati mirror shows. For this, we look first at the efforts made earlier to face this problem without any success so far. Then I will sketch with a broad brush the outlines of the two unequal Gujaratis. This will be followed by showing why it is important to give very high priority to overcoming this inequality. This paper ends with a call for more vigorous policies to reverse rapidly the trend towards increasing regional inequality. This effort has been inspired by the hope that through timely advance action Gujarat may avoid harsher conflicts in the future.

I

A Glance at Past Efforts

The subject of regional inequalities is neither new nor a neglected one. It has been

with us since the dawn of history. Together with other types of inequalities, it has been much studied everywhere. The vast literature which has mushroomed on it need not detain us here. But we must look at what was attempted in the past. By understanding the past, we may be better equipped to face the future. At least four landmarks stand out for the past.

The first landmark was established in 1965. The Planning Commission suggested to the State governments that they classify their backward regions into five categories: desert areas, drought-affected regions, hill and border areas, tribal regions and densely populated areas with low income and employment levels. The last area was to be identified on the basis of 15 indicators of development of the districts concerned. The Gujarat government considered that a district was too large a unit. It therefore chose a taluka as the basis, and applied to it 11 available indicators of development.

A bare 10 years after Gujarat became a separate State, a high-level Committee on Balanced Development of Gujarat was established in June 1970. Jaisukhlal Hathi was its chairman. The report of the committee was submitted in 1971. It illustrated regional inequality in Gujarat with data for various talukas of the State. It identified 56 talukas as very backward.

In December 1971, the Gujarat government decided to give additional financial assistance of Rs 75 lakh per year for minor irrigation and road works. The government thought that its resources were limited. The grant was therefore given to only 33 talukas; and it did not cover industries and electrification. Among these talukas was Lila in Amreli district, Bhesan in Junagadh district and Kalavad in Jamnagar district.

There were some changes in the basis of this grant and in the coverage of the area. A Review Committee was appointed in April 1978. We know little of what the Review Committee found in regard to the success of the government effort of the preceding 12 years. But regional inequality in Gujarat must have survived long after both the Hathi Committee and the Review Committee. The problem had not disappeared. It could have become even sharper. It attracted much attention when the Seventh Five-Year Plan was being prepared. New elections were to take place soon.

The Gujarat government therefore did exactly what governments always do. A new Committee for Development of Backward

Areas was established in December 1984 with an eminent economist and a very senior former civil servant, I G Patel, as its chairman.

There was a notable difference in the terms of the Hathi and the Patel Committees. The Hathi Committee had a wider mandate—'balanced development'; the Patel Committee, in contrast, was to deal with a limited concern—'backward areas'. This may be taken as a reflection of the Gujarat government's functioning. The 14 years which separated the Hathi Committee from the Patel Committee marked a retreat rather than an advance.

The Patel Committee examined in detail data for 184 talukas of Gujarat searching for the backward talukas. The level of development in each taluka was compared by using 25 indicators. They covered agriculture, industry, infrastructure and social and economic welfare. Each taluka was then ranked according to these 25 indicators. All these rankings were then combined to build one single rank indicator, showing where each taluka stood on the ladder of development. In recent years, rank indicators have been used for combined elements which are inherently very different and should not therefore be combined without devising a system of weights for them. This is a serious methodological weakness of the Patel Committee, but this is not the place to take it up for detailed discussion.

I think the report of this committee, submitted in two volumes in August 1984, is a sophisticated attempt to identify backward talukas. But the committee itself was afraid not without reason, that its report might appear "rather long on analysis and short on recommendations".

The committee classified the 184 talukas of Gujarat into four groups: (1) most backward; (2) backward; (3) relatively developed; and (4) relatively more developed. It identified 56 talukas as the most backward in the State. It had warned against the earlier measures of allocating Rs 1 or 2 lakh per taluka as a special grant. Such a modest amount, it concluded, does not serve any real purpose (paras 4.4 and 4.5). Instead, it recommended "strategic intervention on a long scale" (para 4.21).

The government took the gentle recommendations of the Patel Committee in its stride. The pressing need for taking bold action urgently was now gone. The elections were over. The government had other objectives. So it did what governments in India

have done under similar circumstances; continue with the past pattern of the useless pursuit of ridiculously small grants and hope that the problem will disappear one day.

It followed up with three relatively easy steps. This was a bit more generous gesture than that of the Hathi Committee.

The number of talukas considered backward, 56 in 1970, remained the same in 1984. Why this stability of number is a mystery we cannot explore here. But the level of the grant was raised from 'Rs 2 lakh' to 'Rs 2 to 3 lakh'. Never mind, prices too had gone up three times in these 14 years. The real value of the grant in 1985 was thus less than one-half of the 1970 level. That in itself is a good indicator of how much the government was concerned about backwardness!

Now the Patel Committee had finished its work. Indira Gandhi was assassinated. Rajiv Gandhi became prime minister with an overwhelming majority in parliament. Amarsinh Chaudhury, himself an Adivasi, took over as the new Gujarat chief minister. But there was little change in the traditional three-track approach of the Gujarat government. Its mild actions along this track were:

(1) Officials in charge of different sectors were advised to pay special attention to the needs of these 56 really backward talukas. Only god and the government know how this advice was carried out

(2) Each of the 56 talukas was granted funds of Rs 2 to 3 lakh as additional financial

outlay under decentralised district planning. The sum was too small for too big a job. This may be illustrated by two simple comparisons:

(a) The population of a taluka in Gujarat ranged between one to two lakh. A grant of Rs 2 to 3 lakh to a taluka, therefore, simply meant an average handout of 1 to 1.5 rupees per person—not much higher than what a medium-income family would offer on one single temple visit.

(b) Another comparison may be tried. The maximum sum which could have been paid under this scheme would be Rs 168 lakh (56 talukas x 3 lakh rupees)—a silly little token sum which was 0.017 per cent, or no more than one-five thousandth, of the total gross state product (GSP) of Rs 10,379 crore in 1985-86! Was there anyone in State government who believed that this tokenism would in any way help the backward talukas? The absurdity of the action was enormous. But then politics is too often a play of perversities!

(3) There was also a continuation of the reduction from 25 per cent to 10 per cent in the amount of counterpart funds which each taluka was generally required to raise in order to benefit from various official incentive schemes for development. Nobody knows what this complex measure achieved.

Having done this, the State machinery must have felt satisfied with itself. All that was necessary to be done was done. That Amarsinh Chaudhury was the chief minister made no difference. The Gujarat government had its own motion. Nothing more was thereafter asked about how the 56 talukas utilised the grants and what 'benefits' they got from the grant. Nor was there any further review of what actually happened. Did any of the backward talukas take off? Did the economic and social distance between them and the rest of Gujarat actually increase rather than narrow? There was a deafening official silence. It must have been hoped that it would not be shattered by awkward questions.

The Patel Committee must have outdone itself. There were no more committees thereafter. The third and the fourth landmarks were therefore studies by academicians. They provide additional data on the subject. The Centre for Monitoring Indian Economy (CMIE) published in July 1985 a two volume study *Profile of Districts* containing comparative data on nearly all the districts of India. It made it possible thereby to prepare a very rough proxy indicator for the level of gross district output (GDP) for 412 districts of India. It evolved for this purpose a composite index based on nine indicators and their relative weights. Those weights were meant to reflect the structure of the main components of the possible gross product of the districts. The results of this CMIE exercise were published under the title *District Level Data for Key Economic Indicators* (Bombay, November 1987).

The last landmark was the study incorporating the papers presented at a special seminar organised in 1988 by the Bhavnagar

University on *The Economy of Saurashtra: Problems and Prospects* (Bhavnagar, 1990). I had been invited in 1988 to write the Note which outlined the basic issues to be faced, and which was sent to all participants in the seminar to serve as a basis for discussion. The papers for the seminar were published by an Editorial Committee chaired by D T Lakdawala. This publication was followed by a pamphlet in Gujarati, *Saurashtra Taran-vallanpani* (1990) which stressed the intense water crisis in Saurashtra. It gave expression to Saurashtra's suffering by twisting the affectionate words Meghani had used as a title for his *Sorath Taranvehtanpani*.

I wonder why these studies have not exercised serious influence on development processes in the State. It may reflect the indifference of politicians (with the outstanding exception of Sanat Mehta) to such ideas, except at election time when they could be used to get votes. The passive attitude of the people in the backward talukas must have also contributed.

This is probably too long a review of the past studies on the subject. But I think they merit a recall, lest we forget past history. Past studies need to be rescued from decay on library shelves. And future studies on the subject and formulation of more comprehensive policies will have to be built upon the foundations they have laid.

II

Two Gujarats: Rich and Poor

As I mentioned earlier, there are indeed two Gujarats in Gujarat, not one. One of them is the heartland of Gujarat. It is a long narrow strip stretching from Gandhinagar up to the border of Gujarat with Maharashtra. Two arteries of rail and road serve parts of its seven districts (Gandhinagar, Ahmedabad, Kheda, Vadodara, Bharuch, Surat and Valsad). Running to Bombay nearly parallel to each other through Gujarat, they link the population of this heartland of Gujarat to Bombay. The total population of these seven districts was 153 lakh in 1981, or about 45 per cent of Gujarat's total (see Table 1).

This is the prosperous, the well-to-do, the advanced, the developed, the industrial, the rich part of Gujarat. But it should not be imagined that all the 153 lakh people who inhabit these seven districts are equally rich. Indeed, there are many talukas in these seven districts which are relatively very poor, very underdeveloped, most backward. The Patel Committee had identified 17 out of a total of 44 talukas of Vadodara, Bharuch, Surat and Valsad as most backward. The population of these poor 17 talukas was 21 lakh. These people should be excluded from the total population of the rich, well-to-do heartland of Gujarat. When this is done, the heartland's population will be reduced by at least 21 lakh, bringing it down to 132 lakh, or some 39 per cent population of the whole of Gujarat. In addition to the population of these 17 most backward talukas, we should, to be precise, also exclude that of other

TABLE 1: DISTRIBUTION OF POPULATION BY DISTRICTS IN GUJARAT, 1981

| | Number* (in thousand) | Share (in Per Cent) |
|---------------------------|-----------------------------|---------------------------|
| I Poor Periphery | 18,770 | 55.1 |
| Saurashtra | 9,570 | 28.1 |

| 14 Ahmedabad | 3,880 | 11.4 |
| 15 Kheda | 3,010 | 8.8 |
| 16 Vadodara | 2,560 | 7.5 |
| 17 Bharuch | 1,300 | 3.8 |
| 18 Surat | 2,490 | 7.3 |
| 19 Valsad | 1,770 | 5.7 |
| III Gujarat: total | 34,090 | 100.00 |

Note: * Rounded to the nearest 10 for 4 digit, and 5 for 3 digit figures. Because of rounding figures may not add to the totals.

Source: Government of Gujarat, *Statistical Abstract of Gujarat State: 1985 and 1986*, Gandhinagar, 1987.

talukas in these districts which were classified by the Patel Committee as backward. When this is done, the population inhabiting the long narrow strip of rich Gujarat should be some 100 lakh, or about 10 per cent of the total.

It should be recognised at the outset that a study of regional disparities concerns itself with relative prosperity and poverty of geographically identifiable regions and not people in general. After all, if we are to take into account the vast numbers of the poor people in the major cities in the heartland for instance, Ahmedabad, Kheda, Vadodara, Bharuch, Surat, Valsad and several others) we will have to reduce the population of the heartland further by several lakh to make it merit the title of 'rich, prosperous'. This is the inherent limitation of all geographically space-bound area or regional studies. To be fair, we would also have to subtract the population in the relatively more developed talukas of what I have termed the poor periphery. There is at the present state of the study no simple solution to this difficulty. That is why I wanted to give a warning right at the beginning. Everything that is written below is to be read subject to this limitation.

I should also add another qualification. I would agree with the use of a taluka rather than a district by both the Hathi and the Patel Committees to identify backwardness in a region. But I do have, however, several misgivings about their use of talukas for development purposes. The nerve centre of administrative decision-making, planning, implementation and monitoring in India, and also in Gujarat, remains a district. For this reason alone the problems of most backward talukas of a district should be placed within the overall framework of a given district. Only then an integrated planned approach on a comprehensive basis could be derived and implemented. Such an integrated approach would then make it possible to reject the smug satisfaction with which succeeding governments in Gandhinagar have for quarter of a century considered handouts of paltry sums as a solution to regional inequalities.

Before the methodological quantifications become too boring, I must quickly turn to the second Gujarat, the poor Periphery. We may then avoid the all too common scathing remark that methodology is the last resort of the scoundrel. The poor Periphery tells a very different story. It is poor, underdeveloped, weak, agricultural, non-industrial and even less educated.

I have called this part the Poor Periphery of Gujarat for a very good reason. It stretches from the six districts (Bhavnagar, Junagadh, Amreli, Rajkot, Jamnagar and Surendranagar) of Saurashtra in the south-west and west of Gujarat to the district of Kachch in the north-west, and ends with the long arch of six districts (Mehsana, Sabarkantha, Bansakantha, Panchmahals and Dang) in the north east and south of Gujarat. These 13 districts almost completely encircle the Rich Heartland I have described earlier. The encirclement is com-

plete if we add to it the most backward 17 talukas of south-east Gujarat, the Bay of Cambay. The population of these six districts is about 190 lakh or some 55 per cent of Gujarat. With the addition of the most backward and backward talukas, it will be about 240 lakh, or some 70 per cent of Gujarat's total population. This Periphery thus contains a much larger part of Gujarat's population—not a very happy situation if the Heartland were ever to face severe opposition from the encircling Periphery.

I have tried to summarise some basic information on the two Gujarats in Table 2. Before we begin to examine this information, I should warn about its weaknesses. At least four such weaknesses should be pointed out here.

First, these data are limited to districts which usually contain, as both the Hathi and Patel Committees have underlined, many talukas which are really very backward as well as those which are relatively developed. Second, the data are relatively, if not altogether, ancient in some cases—for example, those dealing the crude estimates of total and sectoral output.

Third, the data outline Gujarat's image at a point of time, a photographic snapshot. They do not present, as with a movie camera, the scene changing over a period of time. We are therefore unable to see the changes which have taken place over time.

These changes, so critical to assessing development, are simply absent in this as well as the pictures given by the Hathi and the Patel Committees. But they are central to any perspective of development.

Fourth, the indicators are far from comprehensive. They are too spotty. There are too many gaps. Some of them are very substantial in nature. They do not tell us anything about the total district product; its structural distribution; the volume of domestic savings and investment; net financial transfers from all sources—the Centre, the State and private; and investments in all projects by sector. These key parameters are missing here as also in the work of the earlier committees.

With such deficiencies in data, one should hesitate a lot before constructing an overall image. I thought of giving up the attempt several times. But I have persisted, despite all misgivings, mainly because the earlier Hathi and Patel Committees too, with all the resources at their command, set an example of persistence. I have underlined these weaknesses mainly with the hope that it would put pressure on the State statistical and economic offices to fill up such major gaps. To put such pressure on them was indeed one of my objectives, because I do consider that the available data can be imaginatively used to fill in these critical gaps in information.

TABLE 2: REGIONAL INEQUALITIES IN GUJARAT

| Item | Unit | Periphery | Heartland | Gujarat Total | Periphery (Percentage Share) | Heartland | Periphery/ Heartland Ratio* |
|-------------------------------------|-----------|-----------|-----------|---------------|---------------------------------|-----------|--------------------------------|

Source: Government of Gujarat, Gandhinagar, *Statistical Abstract of Gujarat State: 1985 and 1986*; output (in 1970 prices) taken from Sanatbhai Mehta, "Challenge of Balanced Development of Gujarat", paper presented at Bhavnagar University seminar on 'Economy of Saurashtra: Problems and Prospects', Bhavnagar, 1990, pp 15-17; the per capita figures for the Periphery are my weighted average.

Whatever, the government does or not do, the State secretariat in Gandhinagar should soon set in motion efforts to fill in these gaps. Those gaps are not that difficult to fill in. Only thereafter will all the exercises on district planning and overcoming regional backwardness begin to assume meaningful character.

In view of the weaknesses of the data, I am not going to pretend to be scholarly. Nor am I suggesting that the image is complete in details. But I do believe that even an impressionistic image needs to be presented, no matter how sketchy the outline, if the official arthritis of the last 25 years is to be overcome. The succeeding governments in Gujarat have made too loud noises for too little action on this subject.

Even a cursory glance at Table 2 shows that the per capita output in the Heartland of Gujarat was almost twice as large as in the periphery (lines 2, 3, 4, 5 and 6). The difference was smaller for Saurashtra, but much larger, 3 to 4 times for Kachch and the other six districts in the north, north-east and the south of Gujarat. These figures are over 10 years old. The position now must be much sharper, since during this period the Periphery suffered a prolonged and severe drought and the industrial output in the Heartland nearly doubled.

Agriculture is the dominant activity in the Periphery. The poorer Periphery of Gujarat has 73 per cent of Gujarat's forest and gross sown area. It also reports a much larger irrigated area. This is understandable, since 10 of these 12 districts suffer from rather low and uncertain rainfall. They are not blessed by the bountiful waters of Gujarat's perennial rivers which irrigate most of the Heartland. They had therefore to resort to an intensive exploitation of ground-water.

Much of this rich treasure of ground-water, accumulated over millennia of history, has now been exhausted by the most extensive use of diesel and electric pumps. The ground-water resources are now mostly used up. Water levels in wells, particularly in most of Saurashtra, have gone down from 30 to 50 feet to over 150 feet. In consequence, when the rainfall is exceptionally low, these districts suffer very serious hardships, as was the case between 1983 and 1988. If these districts were not part of Gujarat, from where help came in the form of food, cattlefeed and water, they would have been declared famine or near-famine areas, as was the case with the Sahel countries around the periphery of the Sahara desert.

Using very old (1979-81 base) output estimates, we find that the Periphery did produce nearly 65 per cent of the primary output (including forestry, fishing and mining) of Gujarat. Its foodgrain output was substantial, almost two-thirds of the total of Gujarat.

These figures have led many observers to conclude that the Periphery of Gujarat is quite well developed. They have looked at its agriculture and its commercialisation and diversification and they have at once rushed to the conclusion that this mostly arid and

semi-arid periphery is indeed a very prosperous agricultural region of Gujarat!

Such a conclusion is, however, as misleading as that of several observers of the Third World or the South, who have used the larger share of agriculture in the Third World's total output as an evidence of its agricultural advance. In reality, all the poor countries of the world, and all its poor regions, always have a relatively much larger share of agriculture in their total output. There is nothing extraordinary in this. It does not imply that these regions are agriculturally developed. It only means that other sectors of the economy of these countries and regions, for example, the industrial and industry-related modern services, are not very much developed there. In consequence, agriculture looms very large in the overall image of these generally underdeveloped regions. This is how it has always been so.

In fact, the picture in Gujarat is not much different from that between the developed and developing countries, or the North and the South the world over. Gujarat also has its own developing regions, which are actually spread as a Periphery around the Heartland of the State.

This can be seen more clearly when the data on the industrial and the services sectors are examined. The Heartland of Gujarat has 69 per cent of all factories, 71 per cent of all factory workers and as high as 82 per cent of the output of both the secondary and the tertiary sectors. I should add here that the output figures relate to the period 1979-81. Similar data are not available for the subsequent decade. In view of the rapid expansion of industries and services in the Heartland and the shrinkage of agriculture in the Periphery thereafter one can generally conclude that this share must have increased. In consequence, the Heartland may now be accounting for anywhere up to 85 to 90 per cent of the total industrial output of Gujarat or virtually the same share which the developed countries have in world industrial output.

We do not really have good estimates for the services sector, but we may use data on education as a proxy indicator for it. Education, as we all know, is at the same time both an end and a means of development. To put it in other words; it is at the same time a consumption good because it satisfies a basic common human desire to be more enlightened. And as human capital, it is also a strategic means, or an instrument of investment for accelerating development.

We see that the difference between the Heartland and the Periphery of Gujarat is not very serious for enrolment in primary education. The Periphery is a bit behind the Heartland in secondary education. But a much sharper difference is to be noticed in enrolment in higher education. The Heartland with a much smaller population of Gujarat accounts for as high as two-thirds of the total enrolment in higher education in the whole of Gujarat. Moreover, the difference may be even greater if we are able to take into account the concentration of

institutions of more advanced education in the Heartland, which are in general also qualitatively superior. Thus, the more prosperous part of Gujarat has not only a disproportionately much larger share of enrolment in higher education, it has also a higher level of quality of education imparted to its students. Here is probably the key element which will continue to increase the economic and social gap between the Heartland and the Periphery of Gujarat. But an important qualification is in order here. It is well known that many of the students from the Peripheral districts enrol in the more advanced institutions of higher learning generally located in the larger cities in the Heartland. The percentage shares shown in Table 2 thereby somewhat exaggerate the actual difference.

III

New Setting for Social Conflicts

Some may find it difficult to appreciate why so much fuss is being made about regional inequality. There are several reasons why such inequality has begun to assume in the recent period increasing importance for public policy. The first reason is the very existence of such inequality. People may not take very seriously the Declaration of the Rights of Man (1789) issued during the French Revolution. Nor may they be aware of the marginally earlier Declaration of American Independence which began with the ringing words that all men are created equal. Most people do see inequalities in everyday life and may be prepared to tolerate them, unless these inequalities present themselves in rather a sharp, concentrated and an unreasonable form. Regional inequality is beginning to assume such a form.

Second, such inequality may be tolerated if people remained ignorant of its existence. In the age of instant communication, people in poorer regions learn very rapidly of other regions being better off. They begin to suspect that they are being discriminated against. Such suspicions assume considerable importance in a formally democratic set-up. There the politicians have to face the people now and then to be elected. This is the time when promises are made to eliminate gross inequalities. Weak memories of people may protect for a while political leaders forgetting these promises. But they should not be counted upon to serve as a permanent shield.

The third factor has increasingly assumed greater importance the world over. In earlier periods, conflicts among people centred on the family, the clan and the tribe. These conflicts are now less dominant than before. Since early 19th century, they have been submerged into two other types of conflicts which have dominated the world state. They are conflicts among nation states and class conflicts.

The conflicts among nation states sprang either in the form of wars by imperial power to conquer colonies, or wars among the col-

colonial powers themselves to retain or to share colonial possessions, as was the case with the first and the second world wars. There was also another side to this conflict: colonial rebellions against imperial powers for national independence. National independence movements in Europe of the 18th and the 19th century, and in the developing countries during the post-second World War period furnish examples of such conflicts.

The second form of conflict made its appearance after the industrial revolution. A new class came into existence, the working class. This was followed by the establishment of trade unions, strong advocacy by Karl Marx and other socialists of workers' rights, and establishment of socialist parties of various shades. Conflicts *within* nations thereafter increasingly assumed the form of class conflicts for sharing in the gains of economic, social and political development.

In the recent period, both these forms of conflicts have lost much of their earlier momentum. Nearly all the former colonies have now liberated themselves. Some 160 countries have been recognised as member states of the United Nations. Their national frontiers are now by and large considered inviolable. Exceptions do occur. The recent example of the Gulf conflict demonstrates that a violation of clearly recognised frontiers is not easily tolerated. We still have conflicts among nation states, but they have receded from the world stage.

In a similar fashion, class conflict too has lost much of the earlier sharpness of its edge. In developed Western economies, living conditions have generally improved considerably. The struggle for sharing the gains of development has become institutionalised. Class conflict has thereby declined in importance. The recent eclipse of socialism in Eastern Europe has added to the acceleration of this decline.

One would have liked to believe that the decline of the classical conflicts (national and class) has now brought humanity to a conflictless, peaceful Buddhist Nirvana. Alas! That still seems to be far away. Other conflicts have begun to replace the national and the class conflicts. Several varieties of such conflicts have become important: for example, regional, ethnic, religious, communal and caste conflicts. These new forms of conflicts by and large, though not exclusively, feed upon economic, social, political and other types of inequalities. The reasons often get inter-mingled, so much so that it is never very easy to identify which particular factor among those listed above was the decisive cause.

It is beyond the scope of this essay to suggest which kind of conflicts would arise out of the growing regional inequalities in Gujarat. I do not have that crystal-ball. But it does not require much wisdom to suggest that if the regional inequalities were to continue growing, as they seem to have done in the past decades, they will become the breeding ground for serious social and political instability in Gujarat in the years

to come.

The main purpose of this essay is to draw attention to these possibilities so that wiser counsel may prevail over shortsighted selfishness, particularly among political leaders. Dynamic statesmanship could then take remedial action in advance, which could help avert future disaster. An integrated set of policies might then be devised to foster vigorously a more balanced development of most of the State. Gujarat could then overcome the dominant sense of smug satisfaction which prevails in the upper levels of political leadership. In consequence, an integrated allocation of investment and a transfer of resources may be made in an orderly and an integrated fashion so as to assist the less advanced without punishing the more advanced.

IV

A Few Areas for Immediate Action

It should not be imagined that regional inequalities would be rapidly overcome in the near future. Nor should we at the same time pretend that they will soon disappear, relieving us of this worry, through the casual handout of two or three lakhs of rupees to this or that taluka. The experience of the past 30 years of indifferent action by the State government clearly warns us against entertaining any such delusion. We should, therefore, initiate as soon as possible some action which would prepare us better to grapple with this formidable problem in the years to come. The suggestions made below, rather modest, aim at this objective.

(1) Avoid using the word 'backward'. We should define the problem in terms of the title of the Hathi Committee (1970), and not the Patel Committee (1984). Balanced development is a more sensible overall objective.

One can indeed argue that without an accelerated development of the less developed parts of Gujarat, the advance of Gujarat as a whole is likely to be compromised. As Lincoln wisely suggested a long time ago: a house divided cannot long endure in peace. This does not mean that policies will not have to be directed towards specific target areas—the most 'backward' or the least developed talukas.

By spelling out the implications of the objective of a balanced development of Gujarat, it should be possible to situate the specific needs of the least developed talukas into an overall framework. We would then avoid the *ad hoc*, unco-ordinated 'handout' policies which have characterised the past without any noticeable impact. One might even suggest that regional inequalities have become sharper despite these handouts. And may be even *because* of them, since they prevented the search for more efficient approaches.

(2) Once such a general framework is adopted, we can initiate a new inquiry aimed at:

(i) Identifying the nature and size of

regional imbalances and how they have grown over the last 30 years. Most data for that aim do exist now.

(ii) Assessing the reasons why past policies have failed in arresting the growth in such inequalities.

(iii) Establishing sensible long-term objectives regarding which disparity may be overcome through policy for which area. New policies could then be devised which would be more objective and area specific.

(3) Policies for integrated development of Gujarat as a whole could then be formulated to balance investment and development expenditure flows in a given region with the needs of accelerating its progress. Attention could be focused on Gujarat as a whole—all of its four colour bands which will demarcate, as in a rainbow, in more specific colours its more developed and developed from the backward and the most backward areas.

(4) The approach outlined in (2) and (3) above need not wait for government decision. Political instability may make that difficult at present. The task can be undertaken by a research institute, possibly with supportive government co-operation. Indeed, there is considerable advantage in an autonomous research team handling this critical problem. This could ensure an independent and objective treatment of the subject.

(5) Since 1984, a significant change in Gujarat has taken place as a result of the poor rains in mid-eighties. This underlines the importance of a new initiative on the subject. The images of the Hathi Committee (1970) and the Patel Committee (1984) must have greatly altered since then.

(6) A unit should be established within the State secretariat which will, on a continuing basis, develop and collect data, assess the impact of policies, persuade and monitor the comparative progress achieved by various regions of Gujarat. It should study trends in output, investment and development expenditure financed by the Centre, the State and private persons. It should take stock of differences not only in income but also in productive assets and economic power.

(7) The unit, or a research team, should also study the possible impact of any large project (for instance, oil and gas development, Narmada project, etc) on regional imbalances. Regional inequality is a strategic element in social environment, and should be taken into consideration as such in any new project proposal.

(8) The efforts outlined above could, if pursued, supply the necessary informed basis on which district planning could proceed. Without such a basis, district planning would be like the blind leading the deaf, the dumb and the lame.

District planning would then be rescued from its current pale bureaucracy-dominated image. A way could then be opened to make it alive by active popular participation in shaping and implementing the district plans.

3 PRINCIPAL ACCOUNTING POLICIES

- General
The accounts of the company are prepared on the basis of the historical cost method and conform to the statutory provisions and practices prevailing in the country.
- Transactions in foreign exchange
(a) Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the year.
(b) Income and expenditure items have been translated at the exchange rates ruling on the date of the transactions.
(c) Profit or loss on forward contracts have been accounted for.
(d) Investments
Investments are stated at the lower of aggregate cost or market value.

- Advances
(i) Advances are net of provisions for identified bad and doubtful debts which are made based on a periodic review of advances.
(ii) Advances are shown net of bills discounted with financial institutions.
- Fixed Assets
(a) Premises and other fixed assets have been accounted for at their historical cost.
(b) Depreciation has been provided for on the written down value method at the rates prescribed in Schedule XIV of the Companies Act 1956.
- Staff benefits
Provisions for gratuity benefits have been made on an accrual basis and such provisions have been separately funded.
- Net Profit
The net profit disclosed in the profit and loss account is after:
(i) Provisions for taxes on income in accordance with statutory requirements.
(ii) Provisions for doubtful advances.
(iii) Head office administration expenses have been provided in the accounts to the extent allowed by the tax authorities in the completed tax assessments of the bank. In respect of assessments not completed the charge on this account has also been worked out on the basis adopted by the Department for such allowance. The entire amount on this account has been debited in the current year's accounts.
- In prior years the provision for doubtful debts relating to the Bombay Branch has been recorded in the books of the Head Office.
- Provisions
All financial statements have been audited by a firm of chartered accountants other than M/s. A F. K. R. & Co. The figures for the prior period have been reclassified wherever necessary.

BOMBAY BRANCH

**AUDITORS' REPORT ON THE ACCOUNTS OF THE BOMBAY BRANCH OF
ABU DHABI COMMERCIAL BANK LIMITED
UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949.**

We have audited the attached Balance Sheet of the Bombay Branch of Abu Dhabi Commercial Bank Limited (incorporated in the United Arab Emirates with limited liability) as at March 31, 1991 and the related Profit and Loss Account of the Bombay Branch of the Bank for the year ended on that date signed by us under reference to this report.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account together with the notes annexed thereto, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act, 1949.

We report that:

1. We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.
2. the transactions during the year which have come to our notice have been, in our opinion, within the powers of the Bombay Branch of the Bank.
3. in our opinion, proper books of account as required by law have been kept by the Bombay Branch of the Bank so far as appears from our examination of these books maintained and produced to us.
4. the abovementioned Balance Sheet and the Profit and Loss Account of the Bombay Branch of the Bank dealt with by this report are in agreement with the books of account.
5. in our opinion and to the best of our information and according to the explanations given to us the Accounts together with the notes thereon, subject to Note 5 dealing with the provision for doubtful debts, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and on such basis give a true and fair view in the case of the Balance Sheet, of the state of affairs of the Bombay Branch of the Bank as at March 31, 1991 and in the case of the Profit and Loss Account, of the Profit of the Bombay Branch for the year ended on that date.

Autonomy of Demographic Variables

K N Harilal

MARI BHAT and Irudaya Rajan (*EPW*, September 1-8, 1990) begin their paper on demographic transition in Kerala with the following words of Lord Kelvin, "when you can measure what you are speaking about, and express it in numbers, you know something about it, but when you cannot express it in numbers, your knowledge is of a meagre and unsatisfactory kind, it may be the beginning of knowledge, but you have scarcely, in your thoughts, advanced to the stage of Science, whatever the matter may be" Notwithstanding well known objections to the cited and similar approaches to the theory of knowledge we appreciate the quest for precision and accuracy. However, while encouraging the urge for precision, we should also ensure that the precise statements and numbers so derived truly represent the original ideas lest we all be caught up in a mess of precise but meaningless numbers.

As true followers of Lord Kelvin and in their capacity as trained demographers, the authors have undertaken to employ a rigorous quantitative approach to test some important hypotheses on Kerala's demographic transition which have remained popular without any thorough empirical scrutiny for long. Through a painstaking statistical analysis the authors have identified female literacy as the single most important factor in explaining the demographic transition in Kerala. What makes the study different, however, is not the identification of the most important causative factor, but rejection of 'trivial and incidental' ones. Interestingly, factors so rejected by the authors include many unique features of Kerala economy and society (hereafter Kerala specific factors) which were given undue importance in all the hitherto existing studies on the State's demographic transition. Conclusions of the study, therefore, imply that the population of Kerala would have had the same demographic experience regardless of the specificities of the region's socio-economic evolution. In this brief note, which need not to be taken as a complete critique, we argue that the empirical evidence and the results of statistical analysis presented in the paper are inadequate to draw such drastic conclusions, particularly those on the so-called Kerala specific factors.¹ The numbers presented and then derived by the authors may be very precise but do not fully represent the ideas that the authors have attributed to them.

I

First for identifying factors responsible for the low levels of infant and child mortality they have used cross-section data (1981) for

19 districts in and around Kerala. One of the explanatory variables employed in the regression analysis was a dummy variable designed to capture the impact of all variables that are not directly controlled but which may be unique to Kerala. Contrary to expectations, the coefficient of the dummy variable representing the State was well short of the 5 per cent significance level. Once the effects of higher female literacy and health personnel, the two explanatory variables found to be important, were controlled, levels of under five mortality in the districts of Kerala were not very different from districts in other States. Nor were the results of the regression analysis on the determinants of fertility rate. Here again the coefficients of the Kerala dummy were not statistically significant. Literacy of women and the percentage of Muslims in the population were the only variables found to be important.

This, in short, is the core of their quantitative analysis which enabled the authors to reject all the State specific factors. The authors have cited some such Kerala specific factors mentioned in earlier studies, viz, political will, egalitarian reforms, public distribution system, female autonomy, personal hygiene, ecology and unemployment. Interestingly these are not the only State specific factors that they have rejected. The authors can rightfully claim—thanks to the skilful use of dummy variables—to have tested everything that is unique to Kerala.

The results of their regression analysis, as the authors themselves acknowledge, are surprising. It would even mean that demographic transition of the State can be explained independently of the region's history. Before jumping to this conclusion, one should examine the possible indirect effects of the so called State specific factors. In order to examine such indirect causation, the authors have carried out a few more regressions using adult female literacy and the size of the workforce engaged in health services as dependent variables. Surprisingly, here again the results are not very encouraging for those who 'waste' their time in archives. The coefficients of dummy variable representing Kerala State were positive and significant in the female literacy regressions but negative and significant in the health personnel regressions. It is a great relief to see that the demographic status of Kerala State had something to do with the high female literacy among its people. But after controlling for other covariates, the districts of Kerala had a lower stock of health personnel.²

Do the statistical analyses and their results fully justify the conclusions drawn from them, particularly those on the Kerala specific factors? Our considered opinion is

that the authors should have been a little more cautious while interpreting the results. Let us explain why. In the first phase of their regression analysis, the authors have found female literacy to be the most significant explanatory variable. In our opinion, female literacy itself might have operated as a rough indicator of the socio-economic transition in the State, leaving hardly anything for the dummy variable to capture. In the second phase where they examined indirect causation, the authors have introduced more explanatory variables, viz, population density, percentage of Christian population and percentage of child marriages among females. These factors in their turn would have also robbed the dummy variables of the unique features of Kerala which they were expected to capture. Will it be possible then to say, as the authors do, that the Kerala factors operated only through the identified variables, particularly, female literacy? Here again we solicit caution. Why we are sceptical may be explained in terms of an analogy. Suppose the coefficients of dummy variables are all statistically significant. Will it make us say that the long list of State specific variables, if at all they can be listed, so operated through the dummy variable? If so, what is the analytical significance of the statement that Kerala specific factors, if at all they operated, did so through female literacy? Unfortunately in regression analysis the numbers more often than not, do something more or less than what we expect or assign them to do. If the numerical values given to the dummy variables can capture the unique features of Kerala, why should not another set of numbers which we associate with female literacy do the same job? We cannot impose the norm of 'one at a time' on these numbers.³ For instance, the authors decided that the percentage of Christian population would represent the role of Christian missionaries in the promotion of education and health. They were right, but what if the percentage of the Christian population signifies something more? Christians being one of the leading communities in what the authors refer to as Kerala's transition from familial to capitalist mode of production, districts with relatively more Christians should have been in the forefront of Kerala's socio-economic transition. Therefore, the percentage of Christian population might have captured, without our concurrence, various features of the regions' historical evolution which the authors have sought to ignore.

Selection of nine bordering districts for comparison, which share many features of the State, particularly of the Malabar region, may be cited as another reason for the low key performance of the dummy variables which were expected to capture the Kerala specific factors. Further, as the authors themselves have pointed out, cross-section analysis may not capture historically impor-

tant factors if they do not exhibit substantial cross-sectional variation. In fact this limitation of the cross-section data may also help to explain why the regression analysis could not capture some of the Kerala specific factors. The advantage that the State used to enjoy in certain areas giving rise to the cross-sectional variation with respect to some important variables would have disappeared over time.⁴

II

In order to be fair to the authors, we should also examine the descriptive arguments they put forward to establish the autonomy of the demographic variables and female adult literacy from the socio-economic factors specific to the State. As numbers can be meaninglessly precise, descriptive arguments can be meaningfully vague. We do not propose to cover the entire gamut of their arguments; instead we restrict ourselves to the arguments related to the higher social status of women and structural changes in the economy.

First, let us see how the authors have discarded the notion that high social status of women in Kerala had contributed to the decline in fertility rates. According to the authors the higher status of women in Kerala would mean the absence of strong preference for sons among Kerala's couples. Once this definition of status of women was formulated, the authors tried to examine the relationship between contraceptive use and the number of surviving sons. The authors believe that a society without any strong preference for sons should be characterised by more couples accepting family planning methods at lesser number of surviving sons. The data on contraceptive use, the authors claim, would help us explode the myth that there is no strong preference among Kerala's couples for sons. We beg to disagree. In order to be conclusive on this score we need more information including the number of all surviving children and their sex. For about 50 per cent of the couples, it is only reasonable to assume that their first surviving son will also be their first child. Is it not normal, even according to Kerala standards, to look for a second child? If so, will it not be too much on our part to expect the parents to accept family planning methods before their second child? To the extent there are other categories of couples including those who had a daughter first, use of contraceptives at fewer surviving sons is definitely better in Kerala, which the authors have chosen to ignore. Further, the authors seem to overlook the fact that apart from the sex distribution of surviving children, there are many other factors that influence the pattern of contraceptive use. The analysis on the use of contraceptives and the number of surviving sons hardly proves anything beyond doubt, leave alone presence or absence of any strong preference for sons.

The authors do not subscribe to the view that high social status of women in Kerala had contributed to the growth of female

literacy. In fact they have an alternative hypothesis which sees female literacy as a function of male literacy. The evolution of male and female literacy has a universal pattern; the inequality in literacy by sex would increase with the growth of literacy and come down only at very high levels of male literacy. Thus according to their hypothesis, at comparable levels of male literacy, female literacy will be more or less the same across the regions. If high female literacy in Kerala was the result of higher status of women, the pattern of evolution of male and female literacy in the State should have been different from the rest of India, which according to the authors, is not the case. They have observed that at the same level of male literacy, India and Kerala had approximately the same level of female literacy.

In this connection we have the following points to make. First, it is important to note that India lags Kerala by over 30 years in male literacy. Considering the presence of 30 or more odd years between the literacy figures compared, the authors should not have neglected even the marginal difference between Kerala and India. Second, their insistence on comparison of female literacy at the same level of male literacy is based on a questionable assumption that 'autonomy of women' and 'status of women' are identical concepts. Third, the authors seem to consider the State specific factors including the status of women as ahistorical categories, existing at all stages in history. We suggest that the special features that we attribute to Kerala should be seen only as products of history. If this view is accepted, it would be meaningless to say, as the authors do, that once upon a time the male-female disparity in literacy was severe in Kerala too. In fact, even if we accept the authors' contention that the pattern of literacy evolution in Kerala was not different from that of rest of India, it would not exhaust all that is unique about Kerala. What is important and unique about Kerala which demands explanation is the early beginning of the process of change with its positive impact on all aspects of social life including literacy, literacy differential by sex, fertility and mortality. Finally if female literacy is something that systematically follows male literacy as it was found to be in Kerala too, why so much noise about female literacy levels achieved by Kerala and its implications and lessons for other regions? Note that the authors have placed female literacy at the heart of Kerala's demographic transition and have even drawn a lesson or two from that example for the rest of India. The authors can blame only themselves for setting this trap into which they fall.

III

Between the two important schools of thought that dominate the current thinking on fertility transition, viz, 'structural change argument' and the 'diffusion perspective', the authors have chosen the latter as more appropriate to explain the Kerala case. The

'structural change argument' explains fertility transition mainly in terms of shifts in the balance of economic costs and benefits that child bearing entails to parents. But according to the authors fertility decline in Kerala had occurred without significant changes in costs and benefits of children. The authors are of this firm opinion because according to them, "except for a substantial rise in adult female literacy, in the last 30 years or so there have been very little structural changes in the economy or society that could have tripped the historical balance in the flow of 'wealth' between generations". Note the remarkable ease with which the authors push aside many important factors such as land reforms and the progressive weakening of matrilineal family system, which could not have but affected the "historical balance in the flow of 'wealth' between generations". They do not give any justification whatsoever for ignoring the weakening of the matrilineal system where property descended along the female line. Regarding the impact of land reforms, we should say that their approach is very casual. The impact of land reforms was felt more in the Malabar region than in the Travancore-Cochin area. But it was in the latter that fertility declined first and more rapidly. This cannot be taken as a sufficient reason for ignoring the impact of land reforms on fertility ratios because one can easily think of many other reasons for the relatively late and slower fertility decline in Malabar region. In fact, Malabar would have lagged behind the rest of Kerala despite a progressive role played by the land reforms.

Results of the authors' analysis on the structural features of the economy using parameters such as occupational distribution of labour force, proportion of workers dependent on wages and salaries, incidence of child labour and school enrolment rates were generally in favour of the 'structural change argument'. Kerala economy, in other words, was structurally prepared for an onset of fertility decline. Yet the authors have chosen to undermine the 'structural change argument' because changes in the structural parameters studied did not coincide with but predated the onset of fertility decline. The authors, obviously did not think of a possible time lag, not even the 10 months which could have been easily granted on biological grounds, with which structural factors would affect fertility levels in any country! The authors can also be blamed for not applying the 'time criterion' with the same rigour for evaluating the diffusion perspective. According to the 'diffusion school' fertility decline within marriages is basically the result of the spread of birth control technology. And as the authors put it, "a crucial role in the diffusion was played by literacy and educational levels, particularly those of women". The authors should have provided more convincing evidence to prove that these two factors, availability of birth control technology and the movement towards higher literacy, had coincided with

the onset of fertility decline in Kerala.

In our opinion, the two approaches to fertility decline, viz, 'structural change argument' and 'diffusion perspective', need not be considered as mutually exclusive. The statement that fertility decline within marriages is basically due to the spread of birth control technology is very close to the realm of tautology. This is particularly so because, according to the authors, only 15 per cent of the decline can be explained by the increase in female age at marriage. There is also no denying the fact that literacy, particularly among women, had played a very important role in the dissemination of birth control technology. But what made the people accept the birth control technology? Why did couples in Kerala "switch from having a large number of low quality children to a few number of better quality children"? According to the authors "the switch has come about from the changes in the perception about children's costs and benefits, and in this female education has made a significant contribution" (emphasis added). After having ruled out many important factors including real changes in costs and benefits that child bearing entails to parents, the authors are constrained to explain the rapid decline in fertility in terms of changes in perception about children's costs and benefits! A change in 'perception' without any real change to back it! A change in 'perception' independent of the rich history of social reform movements and the numerous struggles that brought about revolutionary changes in the region's economy and society!

In our opinion, if the authors retrieve some of those State specific factors, including structural changes in the economy, which were ignored without proper justification, the story of Kerala's demographic transition could be complete and more convincing. For the sake of such a balanced approach towards the question at hand, the authors may have to forego some of their conclusions. But then we will all have the satisfaction of having given history its due.

Notes

- 1 We have concentrated mainly on the evaluation of explanatory hypotheses. A more balanced review of the paper should have also considered other objectives of the study, especially the analysis on the trends in demographic variables.
- 2 Note that the authors have interpreted the coefficients as though the dummy variables were expected to represent the Kerala government rather than the State as a whole. Negative and significant coefficient of the Kerala dummy in the health personnel regression is explained in terms of 'not so remarkable' government expenditure. If the dummy was designed to represent the State, the authors should have considered the private initiative in health care, which they themselves have highlighted on a different occasion. Similarly, all the credits for developing the educational infrastructure should not have gone to the rulers.

3 The authors also agree that, at times, the numbers we associate with a selected variable can capture the effects of other covariates. According to them "studies that rely on bivariate analysis tend to exaggerate the importance of age and parity of mother because they spuriously capture the effects of other covariates such as education".

4 The point we wish to make may be illustrated

using the case of female literacy. As the present literacy drive spreads to the bordering districts of Kerala the inter-district variation in female literacy is likely to disappear fast. So much so that the cross-section data collected after the literacy drive may not show any significant relationship between inter-district variation in demographic variables and the female literacy rates.

Edible Oil Policy: Skewed Design

A C Chhatrapati

S J PHANSALKAR and V P Gulati (*EPW*, February 2) have presented a comprehensive statistical review of the edible oil situation. However, their comments on government policies and their alleged impact on various interest groups fall short of objective analysis. They seem to have ignored the interplay of market forces in a highly competitive oilseed and oils economy or short-term political objectives of decision-makers.

Edible oils account for only about 5 per cent of consumer expenditure in India. As the authors have pointed out edible oils are necessary but not crucial to the health of humankind as are carbohydrates and proteins. Nevertheless, since the agitation on rising groundnut oil prices in Gujarat in 1964, oil prices have assumed unusual importance in the democratic polity of this country. Prices of proteins, pulses and non-vegetarian foods have risen much more than of edible oils but there is hardly any political comment. It is this short-term political angle of government policies which has resulted in several distortions in edible oil policies.

Take the case of allotment of significant quantities of imported oils to the vanaspati industry. Imports of edible oils started in 1964 in response to the agitation against high groundnut oil prices in Gujarat. The government could afford to import only soyabean oil under US PI-480. Raw solvent extracted soyabean oil is inedible. Developing consumer acceptance for such refined oil requires long-term marketing efforts. As vanaspati at the time was made entirely from groundnut oil government required the industry to use all the imported soyabean oil to release groundnut oil for direct consumption.

The vanaspati industry with about 60 factories was the only organised sector in the oil economy. Edible oils produced by thousands of oil mills, 'ghanis', etc, sold through lakhs of dealers were beyond the control of government. The availability of cheap imported oil for vanaspati became a handy tool for controlling the price of vanaspati which was politically important for the Central government.

The statements by the authors that "Vanaspati industry is the most stable and profitable segment of the edible oil sector" and "The vanaspati industry was given an average of 4.5 lakh m tonnes per year of imported oils at cheap prices, allowing the industry to make large profits", have no factual basis. No industry has prospered under government imposed statutory or informal price controls. The fate of vanaspati was no different. Disallowance of increases in manufacturing cost, enforcing prices even when imported oils were physically not available, imposing prices even when the proportion of imported oils used by the industry was below 50 per cent in a highly fluctuating indigenous oil market did cause frequent crises in the industry.

The only benefit the industry gained was the growth of the vanaspati market at a

higher rate than the general fat consumption because its prices were generally kept relatively lower as compared to those of major oils like groundnut and mustard. A reference to the representations by the vanaspati associations would show that they were opposed to price control. This is natural because when the prices of the raw material account for nearly 90 per cent of the cost of vanaspati excluding taxes and when the raw material prices fluctuate 30 to 80 per cent in a year seeking price stability in vanaspati was irrational. In a rising oil market vanaspati sold in the black. In a falling market vanaspati sold at a discount. Thus price control on vanaspati was a political decision which did not benefit the industry or the consumer much.

The authors also seem to have exaggerated ideas about the influence of oil millers and traders. No doubt, there are trade associations in all major centres of oilseeds and oil trade, primarily to evolve norms of orderly trade and provide mechanism for resolving trade disputes. Their capacity to influence government policies even at State levels, let alone Central level, is very limited. Other wise you would not have seen regular raids on millers and traders whenever prices rise, restrictions on inter-State trade, penal margins on credit, etc. Experience of the last 25 years shows that these measures are largely ineffective in influencing the oil price trends which continue to be governed by the local supply and demand of specific oils. In fact, the derisive name 'telia raja' coined by the politicians is a misnomer. Large oil mills in major centres disappeared in 1950s when excise duty was imposed on oils. Oil extraction is reserved for the small-scale industry for traditional oilseeds. Therefore, in the oil mill sector and in oil trade one can hardly find financially powerful units.

Solvent extraction industry came to be established primarily as an export-oriented industry. In 1950s Europe was facing a shortage of cattle feed. Solvent extracted groundnut meal therefore became a profitable export item. This led to the establishment of a large number of solvent units in Gujarat and Maharashtra where groundnut cake was available in plenty. Solvent extracted groundnut oil requiring refining did not fetch a good price. Mustard oil cake found no export outlet until very recently because of its high glucosinolates. The export market for groundnut meal collapsed after 1977 when aflatoxin in groundnut meal was found to be harmful to poultry and cattle. This led to closure of units in Saurashtra, etc.

When oil prices started rising and extraction of oils from rice bran and other minor oil-bearing materials became viable, new units were established in convenient locations, having special equipment to process such materials. The growth of soyabean crop again encouraged more units in Madhya Pradesh. Thus, the solvent extraction industry has continued to grow despite its large excess capacity because of specific needs in

location or processing technique. In the absence of an organised cattlefeed industry in the country solvent extracted meals have limited outlet in domestic markets. They continue to depend upon exports.

It is incorrect to say that solvent extraction *per se* is inimical to the interest of cattle industry. The world over only solvent extracted meals are used as the scientific opinion is that cattle do not require more than 1 to 1.5 per cent fat in their meal. What is needed for a healthy cattle industry is an organised cattlefeed industry. The authors are incorrect in their statement that high fat content in cake is necessary for the fat to be present in milk.

The authors incorrectly imply that large imports were encouraged as they help to produce financial surpluses for government. The primary consideration in arranging imports of oils from the beginning was the need to regulate the price of vanaspati and in 1980s to feed Public Distribution System in the hope of influencing the edible oil price level. I entirely agree with the authors that the allocations of imported oils was irrational in the sense that large quantities were released during the harvest season and that bulk of the oil was allotted to the oil seed producing States. In fact, the States with the largest number of the poor, viz, Bihar, UP, MP, Rajasthan and accounting for 25 per cent of the population received only 8 per cent of the total oil released for PDS.

It must be accepted that the release of cheap imported oil both to vanaspati and PDS did affect the farmers adversely as indigenous oil prices were kept depressed in relation to the general price index during 1978-86. It also encouraged fat consumption to go up in the country by nearly 40 per cent entirely through imports.

Sarigam Steels Casting a fine future and Forging ahead in an expanding industry

Sarigam Steel has been promoted by the renowned metallurgist and technocrat Shri Shyamlal Yadav, who pioneered the making of stainless steel in Gujarat using the induction melting system. His rich experience of over 25 years in this very specialised field has borne abundant fruit. Sarigam Steels has been a winner from the start, indicated by the rising turnover each successive year.

To satisfy the continuously growing demand from core and prime industries Sarigam Steels plans to enhance production capacity from 3200 MT to 15000 MT per annum by installing a 5 MT furnace. The Company also plans to manufacture forgings out of castings, for which they will instal open and closed die forging plants. The promoters have already made arrangements with overseas buyers for 100% purchase of the Company's finished products of forgings.

A glowing future lies ahead for the Company and for you. Cast a solid future with Sarigam Steel.

ISSUE HIGHLIGHTS

- ▶ Existing profit-making Company – No Gestation Period
- ▶ Renowned metallurgist-technocrat promoter
- ▶ Excellent location in the highly industrialised Western Zone
- ▶ Multi-application product range
- ▶ Demand/Supply imbalance presents excellent scope for import substitution
- ▶ Potential for value added exports
- ▶ Easy liquidity – listing at Ahmedabad, Bombay, Calcutta and Vadodara Stock Exchanges

If the Company does not receive the minimum subscription of 90% of the issued amount, the entire subscription will be refunded to the applicants within 90 days from the closure of this issue. If there is a delay in refund of such amount by more than 10 days, the Company will pay interest at the rate of 15% per annum for the delayed period.

Reaching a new high

At Colour-Chem this is a credo. It keeps us trying harder seeking greater heights to conquer.

That's how we've more than doubled our exports in the last four years, reaching a new high of Rs 1675 lakhs in 1989-90. An export performance based primarily on indigenous value addition in order to maximise net foreign exchange earnings for the country.

Today we are a recognized Export House with Star Exporter status. We export organic pigments, dyes and intermediates to the most sophisticated markets in the world — U.S.A., West Germany, U.K. and the Far East. More than 96% of our exports go to General Currency Areas.

Our quest for excellence has also won us awards — eighteen, in two decades.

The quest continues.

Poverty: Cooked Up Figures

The massive reduction in the incidence of poverty in 1987-88, as reported by the Planning Commission in 1990, is once again largely a consequence of the peculiar statistical artefacts used by the commission. The appropriately computed incidence of poverty in 1987-88 comes to 44.8 per cent and 36.5 per cent, respectively, in rural and urban India, rather than the artificially low estimates of 32.7 per cent and 19.4 per cent reported to parliament by the Planning Commission in 1990.

1673

Economic Restructuring: Problems and Pitfalls

The current IMF-World Bank strategy towards India is designed to create conditions in which any residual reluctance on the part of decision makers here to agree to the most damaging conditionalities will be wiped out.

1647

India needs foreign private capital only where technological upgradation is required, as in capital goods and basic intermediates, or in areas where foreign capital is intended for export production so that there is a substantial net foreign exchange gain. Will the proposed amendment of FERA help achieve these objectives?

1645

The import-dependence of the industrial sector has increased in the post liberalisation period. The statistical evidence.

1693

Same Card

It was the Congress Party's resort to the Hindu card which prepared the ground for the sharpening of the BJP's communal stance and has, as the last election has shown, resulted in competitive communalism between the two major political parties.

1649

Hunting Houses

Calcutta's housing problem is compounded by a peculiar piece of urban legislation which, when twisted and turned the right way, allows for the operation of a corporation police builder nexus to the detriment of the poor.

1655

Smile Gone Sour

British Airways 'the world's favourite airline', is none too happy about the lifting of the ban on new 'slots' at Heathrow, its home base.

1657

Plants and Property Rights

If intellectual property rights are extended to plants, all aspects of agricultural development in third world countries—supply of seeds, incomes of farmers, absorption of technology and prospects for exports—will be negatively affected.

1660

The Problem

The Congress(I) is back in power, but the country's problems will not go away. For that party is the country's major problem. It is responsible for the mess in Kashmir, for Punjab's alienation from the rest of the country, and no one yet knows the sort of deal it has struck with the ULFA and Bodo insurgents.

1643

Unmodern Trends

Maharashtra's modern history has been subjected to increasing deification. And when personalities are turned into divinities, no critical assessment is possible. The land of Phule and Shahu Maharaj is falling back to medieval times and it is going to take a wide ranging movement to fight the unmodernity setting in.

1653

Left Out

In 1986 the revolutionary Left in Philippines almost ran aground amidst the upsurge of support to Cory Aquino. Why did the Left, despite its tradition of political analyses, fail to anticipate the new contradictions which were emerging and to give priority to the issues related to political democracy which became so essential then?

1683

LETTERS TO EDITOR

Pre-Election Police Terror

DEMOCRATIC rights have become 'sky flowers' to the sons of the soil in Telengana. More than 10 workers of various CPI(M) groups were killed by the police in fake encounters in a span of a month just before the elections. The reason for all this chaos, as the government sources stress, was the need to conduct elections 'freely' and to ensure 'law and order' in the villages. As per official assessments, 3,000 villages needed tight police 'bandobast' and were supposedly facing a law and order problem. That's why a 15,000 strong central police force was put in operation in Andhra Pradesh. These arrangements had been made in the wake of the call given by the CPI(M) People's War Group to boycott the Lok Sabha elections and another call given by other CPI(M) groups to support the revolutionaries wherever they were fighting the elections. Ironically both these calls escalated the range of repression of the police in certain areas. Police vans surrounded the villages, beat up everybody including women, children and the aged, dumped them in the police stations and subjected them to torture—beating with tyres, plucking out nails, giving electric shocks and lathi treatment—in addition to the routine 'encounter' and 'lock up deaths'.

In Karimnagar district, three members of the CPI(M) Chandrapulla Reddy group, Sridhar, Mallesham and Nazeer, were killed in fake encounters in April. Almost all the villages of Karimnagar Lok Sabha constituency were subjected to police attacks and torture for supporting the CPI(M) CPI candidate N V Krishnaiah. The police forced party workers to promise never to support CPI(M) CPI group candidates. The 'agreements' were mediated through the ruling party leaders including those of the Congress (I), TDP, BJP, Janata Dal, etc.

On May 2, an SI along with a five member team in a drunken state attacked Shahnagar of Ramadugn Mandala and created panic among the villagers. The women were beaten on their sensitive parts and the police alleged that the women had illegal contacts with 'sangham' leaders and workers. Later the villagers along with N V Krishnaiah met the district collector and showed him the wounds. In Adilabad district of Kashipet in May, three members of the CPI(M) CP group, J Mallaiiah, J Buchaiah and B Lingaiah were killed in fake encounters in Venkatapur village. In Burgampahad area in Khammam district a woman worker was cruelly killed in an 'encounter'. In Maddikanta village of Macharsally mandal an SI with his team made a lightning attack on May 3, terrorising the people and destroying property—grain pots, electric motors and utensils were thrown into wells, ration-cards, pass-books, money and valuable goods were carried away by the police. A pregnant woman and another who had just delivered were tortured cruelly. Padmajiwadi Daggi of Sadasivnagar mandal witnessed these events. The police forced the people to rub out the 'boycott' slogans. In

Vajjepally village in Gandhari mandal the police broke open the locks and ransacked property after the people had fled in terror. Talking to press persons the district SP, R P Meera, claimed that "200 militants have surrendered to the police in four months. If there are untoward incidents during the operations we are not responsible for that".

SURYA

Hyderabad

West Bengal: Uses of BJP

THE polls in the traditional Left bastion have revealed interesting features not foreseen either by the ruling Left Front or by its main electoral rival, the Congress(I). On the surface, the results do not show anything extraordinary, the Left Front has retained its overwhelming superiority in terms of the number of seats bagged. The Congress(I) has marginally increased its tally from 39 to 43 seats. The GNF and the Jharkhand Party (both supported by the Congress(I)) have got two seats and one seat respectively, and the SUCI has managed to retain its two seats. The Naxalite groups have improved marginally but are as yet far from emerging as a powerful force. The most significant aspect of the results, however, is the spectacular rise of the BJP from a position of near non-existence to one of considerable strength. It has not won a single seat, but has succeeded in obtaining about 12 per cent of the votes, mainly absorbing the negative votes against the Left Front or cutting into the already existing vote-bank of the Congress(I), thus frustrating the latter's hopes of capitalising on the Left Front's failures. The BJP's emergence as a force has caused surprise even among the Left Front leaders and is now widely discussed in the Bengali press.

However, the BJP has not only made in

roads into the vote-base of the Congress(I) but has influenced CPI(M) and even Naxalite supporters to some extent, particularly in the mofussil towns and the countryside. In West Bengal, there is no movement of the dalits and the backward classes to counter this onslaught of the VHP-BJP combine. Only one small organisation, the PCC, CPI(M) (it got about 70,000 votes in the assembly polls), publicly demanded the implementation of the recommendations of the Mandal Commission. And those sections of the masses who were disgruntled over the performance of the Left Front and found the Congress(I) too unorganised a platform have been assured by the BJP that their interests and grievances would be looked after.

The aggressive Hindutva of the VHP-BJP-RSS first came to the surface in this state before the Ninth Lok Sabha polls with the holding of brick worship ceremonies and the active clamour for a 'Hindu Rastra' by the BJP. The Left Front government did little to check this emerging Hindu wave and those who tried to put in some sort of active protest were mocked at by the CPI(M) ideologues. Again, the Marxist-led government saw to it that the bricks meant for the infamous Ram 'shilanyas' were safely carried through the state. It certainly boosted the morale of the Hindu chauvinists and their organisational activities were renewed with greater vigour. There are reasons to believe that they were tacitly encouraged by the ruling Left Front in the hope that this would cut into the Congress(I) votes and facilitate an easy victory for the front at the hustings. But the front and its main partner, the CPI(M), could not conceive that the BJP would emerge far stronger than they imagined. If in the coming years, the BJP creates more disturbances in the state the ruling Left Front government must now pay the price for its earlier stance.

To Kill the Patient

THE more he protests that he is not following the diktat from Washington, the faster is the finance minister losing his credibility. On top of it he splits hair about whether the reduction effected in the rupee's exchange rate by 19 per cent in the space of three days was depreciation, exchange rate adjustment or plain devaluation. The hard fact is that the government has been driven to accepting the most stringent of the conditionalities—a sharp devaluation of the rupee. The trade reform package recently prepared by the World Bank for India called for an initial devaluation of the rupee of 13 per cent and the ultimate figure was set at 22 per cent. Since the government has decided to devalue the rupee by almost 20 per cent straightaway, it would appear that we have not been given even the option of implementing the reform package in phases. Of course, the IMF could not be satisfied with devaluation alone. That the next thing it would demand was action on the trade front is borne out by the 13-point trade policy package unveiled by the commerce minister, which principally seeks to link practically all non-bulk imports to exports through the instrumentality of the REP. Here it is worthwhile recalling that the World Bank report had suggested precisely such a course of action. What now remains to be implemented is a sharp reduction in tariffs—the commerce minister has already hinted at this—and the reduction in the so-called fiscal deficit.

The Washington establishment believes that while liberalisation during the 1980s coupled with the more expansionary macro-economic policy and relaxation of restrictions on industrial investment and production decisions led to acceleration of the annual growth of value added in manufacturing, it is emphatic, quoting its "econometric simulation experiments", that "relaxation of import controls has not been responsible for the deterioration of India's balances of payments". This assertion simply flies in the face of the reality. The country's balance of payments had been under pressure throughout the 1980s, but it was in the second half of the decade that the deficit really surged. From 1.2 per cent of GDP in the first half of the decade it rose to 2.3 per cent in the latter half. It was the marked rise in imports in the Seventh Plan period, from Rs 17,135 crore in 1984-85 to Rs 34,416 crore in 1989-90 (the figure for 1990-91 is Rs 43,171 crore) which has created the payments impasse of today. The manner in which these additional imports were financed, namely, through commercial borrowing, including of the very short-term variety, and repatriable NRI deposits, have now compounded our problems. But the root cause lay in allowing imports far in excess of our current foreign exchange earnings. The major part, some nine-tenths, of the surge in imports was accounted for by what are referred to as non-bulk imports, comprising principally capital goods, components, raw materials and spares. How much of these additional imports were required to increase export production and how much for production of inessential items for the domestic market is a question that policymakers have avoided facing, no doubt deliberately because then the answers they would reach would have been very different from the ones they are being told to parrot. Hidden behind the figures of the trade deficit are also sizeable imports on government account, which possibly accounted for the bulk of the

cumulative gap in import data of as much as \$ 10 billion identified by the World Bank for the five-year period, 1985-86 to 1988-89. Basically, the point is that to explain the surge in imports in recent years, one does not have to go into the changes in the macro-economic scene so much as into the specifics of trade policy as it translated itself into various types of imports.

As regards the devaluation of the rupee, it is significant that during the period when the rupee underwent substantial depreciation—by as much as 70 per cent against the SDR between 1985-86 and 1989-90, far in excess of what was warranted to keep the real exchange rate stable—imports have sky-rocketed and the trade deficit widened. It was difficult, therefore, to see the rationale of the argument for further devaluation of the rupee. So when the finance minister asserts that the sharp devaluation he has now resorted to is in the national interest, he cannot have in mind reduction in the trade deficit, certainly not in the next few months or even years.

On trade reform, it would have been a total throwaway if the various export incentives had been continued after the sharp devaluation. But it is well to bear in mind that the new 'exim scrip', entitlement to which has been raised substantially, is bound to command a high premium, probably much higher than its old counterpart in view of the total link-up of non-bulk imports to these scrips. On the impact of the 13-point package on the trade deficit, one will have to wait and see when, if at all, any significant reduction does come about and then at what cost in terms of growth, inflation and equity.

While the finance minister is still to show his hand in the matter of the fiscal deficit, which in the World Bank scenario emerges as the principal villain of the piece, it is obvious that the emphasis on reducing the fiscal deficit rather than the budget deficit, or Reserve Bank credit to the government, is highly motivated. Analytically, it is the budget deficit which can be said to have a direct expansionary impact. On the other hand, a large part of what is referred to as the fiscal deficit may be, and actually is, nothing but transfer of household savings to the government. The basic point is that whatever may be the other implications of government borrowing from the household sector, when one is looking at the macro-economic impact of the government's fiscal operations, the appropriate concept of deficit is none other than that of the budget deficit, a concept of long usage in this country.

It is true that the budget deficit increased from 1.7 per cent of GDP in the first half of the 1980s to 2.1 per cent in the second half (the peak deficit of 3.1 per cent was reached in 1986-87). Also, there can be no two opinions that if inflation is to be contained the temptation to resort to budget deficits has to be firmly resisted. But since what the Washington establishment is forcing down our throats is a drastic reduction in the fiscal deficit, the possibility cannot be overlooked that even when the fiscal deficit is reduced there may well be no reduction in inflationary pressures. The government's fiscal operations will no doubt be curtailed, and perhaps quite severely, as a consequence of whatever measures the forthcoming budget proposes, but not necessarily their inflationary impact.

KASHMIR

Left in the Lurch

WHATEVER their objectives might be— independence from India or joining Pakistan —the militant groups of Kashmir are increasingly getting distanced from their goals. As in Punjab and with similar terrorist groups in other parts of the world, the means are overwhelming the ends. Kidnapping, indiscriminate killings, extortions and so on are leading them nowhere and are inviting instead from a vindictive state repression on the common citizens.

The end to the drama of kidnapping two Swedish engineers—who were released according to their abductors, but had escaped according to their own version—suggests the futility of such adventures indulged in by the militants. After keeping them in custody for 97 days, their abductors found that they had gained little. Their demand that the Swedes could be released only after Amnesty International was allowed to come to Kashmir and investigate into allegations of human rights violation was senseless. It is not as if such allegations had not been proved. Numerous Indian human rights groups, as well as journalists from India, had highlighted cases of atrocities by the Indian security forces in Kashmir. Their reports have received international publicity. In fact, Amnesty International had been using these India based reports to expose the role of the security forces at world conferences such as the recently held UN Human Rights Commission meet. Although one agrees that Amnesty International or civil liberties groups from other parts of the world should be allowed to come to Kashmir and see for themselves, one does not understand how this would help the cause of the Kashmiri militants. Yet another report about atrocities committed by the Indian security forces would reinforce the authenticity of the allegations already made by Indian human rights groups. But that is about all. How would it help the cause of the militants—whatever that cause might be? As it is quite evident now, Amnesty International was not willing to be blackmailed by the militants. After all, how can one expect a human rights organisation to accept conditions from a group of terrorists who themselves were violating the human rights of two innocent individuals by keeping them in custody?

In fact, had the militants been so concerned about the violation of human rights of their fellow Kashmiri citizens, they should have refrained from irresponsible actions like operation in heavily crowded localities which invariably led to loss of innocent lives. It seems, therefore,

that their demand for Amnesty International's attention was an afterthought following their realisation that the kidnapping of the two Swedes had become more of a liability than a really worthwhile catch (unlike the earlier cases of abduction of daughters of Indian VIPs).

What adds to the murky nature of militancy in Kashmir is the division within the ranks of the militants. While some (like the JKLF) want independence, others (like the Islamic fundamentalist Hizbul Mujahideen and similar other outfits) want integration with Pakistan. The latter prospect does not seem to inspire much confidence among ordinary Kashmiris, given the shabby treatment meted out to their fellow countrymen in Pak occupied Kashmir by Islamabad. The reports about the recent elections there and the repression following it should disabuse those among the Kashmiris on this side of the border who believe that things would be better if they become a part of Pakistan of their illusions. But the Islamic fundamentalist militants enjoy moral and armed support from Pakistan which gives them an edge over the JKLF. Most of the kidnappings, killings and extortions are being done by these fundamentalist groups whose superior fire power intimidates the ordinary Kashmiri citizens. Young victims of state repression, either out of the need for sheer protection or vengeance are gravitating to these groups who appear to be more powerful than the pro independence groups like the JKLF.

For the person in the street in Kashmir it is a traumatic situation. The atrocities by the Indian security forces push him to oppose the Indian state. But, unlike his counterparts in other areas of India, he does not have any democratic avenue to express his opposition. Unlike also the national liberation movements in other parts of the world, he does not have any participatory role in the secessionist movement in Kashmir, dominated as it is by a handful of terrorist groups which are getting more identified with Pakistani interests than with the cause of Kashmir's autonomy. Left without any option, the Kashmiri people are being dragged down into a politically self defeating, marsh, watched complacently by Left and secular forces in India which refuse to take up their cause and integrate it with their political programme.

DEVALUATION

Easy Way Out

FIRST when the rupee is devalued by 8.5 per cent, they deny altogether that it was a devaluation, claiming that it was only an adjustment of the exchange rate in the ordinary course of things. Within 48 hours, the rupee is devalued further, this

time by 11.35 per cent. This time nobody bothers to contest that it is a devaluation; now the whole effort is concentrated on rationalising the measure. It is forgotten altogether whether the downward adjustment of the rupee's exchange rate amounts to a devaluation or a depreciation or what have you. The day after the second dose of devaluation the finance minister announces that "India's foreign exchange crisis is over for the present" and thanks foreign governments. The next day, in his inaugural address to a seminar on the 'national economic crisis', he makes a forceful defence of the devaluation and the trade policy reforms announced by the commerce minister and takes the opportunity once again to thank international agencies and foreign governments for the supporting role they have supposedly played in the resolution of the crisis. Somewhere, in a corner of the newspapers the same day is the report of a large team of IMF officials having reached New Delhi for discussions with the government.

The sequence of events is significant. When the rupee was administered the first dose of devaluation, it was perhaps thought that the forceful denial that it amounted to a devaluation at all, a denial strongly defended by several academics, would send the necessary signal abroad without the government having to face domestic criticism for resorting to devaluation when the case for such a step was by no means clear. After all, despite the rupee's depreciation by over 10 per cent in the past six months there had been a sharp deceleration in the growth of exports. The commerce minister's subsequent statement on trade policy reform clearly brought this out. But evidently the signal sent by the first dose of devaluation was not found sufficiently impressive by the concerned international agencies/governments. So something more needed to be done and that too immediately. Hence there had to follow not only the second dose of devaluation, with the pretence that it was only an exchange rate adjustment being discarded, but also the trade policy reform package along with a public commitment to further measures.

Does not the sequence of events tell clearly who really is in the driver's seat? All the bold talk that the government will not accept any conditionality that goes against the national interest is so much hot air. The fact is that we are being given no option and are being made to sign on the dotted line. And all because we have chosen to follow the easy, though suicidal path of borrowing more and more—this time under the IMF umbrella—in order to meet our debt servicing obligations. The IMF path is easy once one develops a thick skin and becomes insensitive to being ordered about regarding what national

does not have to take hard decisions about restructuring trade or the budget—the type of restructuring that would certainly be very different from the one the IMF would have us adopt

DELHI UNIVERSITY

Low Politics

A Correspondent writes

FOR the last few months politics among the Delhi University teachers seems to be following in the tracks of their students. Opportunistic alliances among political groups, factional quarrels, 'dharnas', boycotts and, finally, physical assaults, have come to mark the operations of the Delhi University Teachers' Association (DUTA)

During the anti Mandal agitation, the Congress(I) had joined hands with the BJP to oust the left from the leadership of DUTA. Ever since then this cabal had been running the show of the teachers' organisation and disrupting the functioning of the university. At the end of May this year, they physically removed the then head of the education department, Krishna Kumar, alleging irregularities in appointments in the Maulana Azad Centre for Elementary and Social Education. Their main grouse was over the appointment of A. K. Jalaluddin, former director of NCERT (National Council of Educational Research and Training) who they feared would become the next head. Since their own candidate did not possess the necessary qualifications to compete with Jalaluddin's, they felt that the best way to block the latter's entry into the department was by a demonstration of their physical might. They succeeded in their game. The university's executive council, at a recent meeting, endorsed the professorship of the candidate set up by this group. As for Jalaluddin, he is reported to have been advised by the vice-chancellor to "lie low for sometime". He is believed to be reluctant to move into the quarters allotted to him in the campus—the allotment again having been made into another issue by the Congress(I) BJP coterie—because of fear of insecurity.

The vice-chancellor's role in the entire incident has come in for criticism by the university's teaching community in general. In spite of repeated requests for setting up an inquiry into the incident involving the assault on Krishna Kumar, he sat on the matter for more than a month. Only recently an investigation team has been set up, with the university's proctor as one of its members. Meanwhile, even those among the teachers who were alleged to have been a part of the group which for-

fice were allowed to appear for interview before the selection committee which recently met to appoint professors. Teachers feel that by permitting this, the vice-chancellor is "rewarding coercion" and succumbing to the bullying tactics of the Congress(I)-BJP combine.

Cracks have, however, appeared in the Congress(I) BJP alliance—not on account of the so-called ideological differences that the national leaders of the two parties are at pains to assert every now and then, but the very opportunist motives that initially made them come together. A tussle has broken out between the Congress(I) and the BJP groups over appointments in the Indra Gandhi Institute of Physical Education, the governing body of which is headed by the BJP leader V. K. Malhotra. The Congress(I) suspects that the institute is being filled with BJP people, while its own candidates are being left out. The Congress(I) president of DUTA gave a call for 'dharma' in front of the vice-chancellor's office recently protesting against the appointments in the institute. The BJP faction of DUTA promptly issued a statement opposing the 'dharma'. It would be interesting to watch how the vice-chancellor deals with this tricky situation. Which of the two groups will get the 'reward' in this competition of coercive politics—the representatives of the ruling party or those from the BJP?

NRI DEPOSITS

Stemming the Outflow

SOURCES in the finance ministry have for quite some time been reported to be extremely concerned over the heavy withdrawal of funds from the special NRI deposit accounts. That was before the rupee was devalued, the first phase of which was initially described by the same sources as only routine adjustment of the rupee's exchange rate. Following the two stroke devaluation, enquiries were reported "to be pouring in from abroad about the re-conversion of rupees in the NRE R accounts to foreign currencies". Could it be that the NRIs had got wind of the forthcoming devaluation? Or were they reacting to the worsening external liquidity position of the country relative to the obligations to be discharged week after week? These questions will have to await clear answers until such time as much more information becomes available.

However, that holders of NRE R accounts have been anxious to convert their external rupee deposits into foreign currencies in the wake of the devaluation is quite understandable. Here were NRIs who had put their foreign earnings in rupee deposits without realising that the

carried did not compensate them for the risk of exchange depreciation. Even though the deposits were in theory repatriable, in actual practice a five-year deposit taken in 1986 would, when encashed with interest in dollars in 1991, have barely managed to retain its original dollar value because in the meanwhile the rupee had depreciated by almost 70 per cent. And if the encashment fell due after the latest devaluation, the dollar out-take would be smaller by 20 per cent. Who in their right senses would go in for an investment like this?

Evidently, many did. Or else how could the NRE R accounts have added up to over Rs 6,000 crore as on April 1, 1990? The only explanation can be that these depositors never expected the rupee to depreciate at the rate it actually did over the past five six years. Certainly they could not have foreseen that on top of the depreciation from time to time, there would also be a sharp one time devaluation as well. In fact, precisely because the calculations of these depositors had gone awry, for the past two years at least there had started a net outflow from the NRI R accounts.

Still, if an amount as large as Rs 6,000 crore was outstanding in these accounts, should not the government have done something to prevent the outflow particularly after the decision to devalue the rupee? On the one hand, we are prepared to go all out in surrendering to the conditionalities of the international agencies. On the other, we just would not do the right things by our own people.

Our government's attitude on the subject is reflected in the finance minister's dismissal of Jyoti Basu's suggestion to tap NRIs with the observation that "NRIs will not send any money to India as long as our reserves remain at the dangerously low level that they are now". Is not the government's most immediate problem to prevent the outflow of several billion dollars worth of NRI deposits it holds already? But because the government's sights are fixed on the IMF loan it has closed its mind to alternatives.

SPORTS AND APARTHEID

Hasty Step

THE International Olympic Committee's decision to readmit South Africa into the olympic fold and allow its participation in the Barcelona Games next year is not only hasty but—as the president of the National Olympic and Sports Congress of South Africa has pointed out, these actions give the impression that they are rewarding the oppressor instead of the people who have been fighting against

apartheid for the past 30 years". The hasty lifting of the ban on South African participation in sporting, cultural and intellectual fields will make the new phase of struggle against apartheid more difficult.

While there can be no doubt that economic sanctions against white South Africa was a major external factor in bringing about the current changes in the apartheid structures, it was the long years of isolation of the country's sporting, cultural and intellectual interests which brought the issue of apartheid into open debate in these circles and created a significant body of opinion which at the minimum saw apartheid as an obstacle to South Africa's integration into the world community. With the lifting of apartheid laws, these sections will play a significant role in the long process of breaking down race prejudices. On the other hand, it is equally true that, with notable exceptions, little has been done to alter the structures of professional sports associations in South Africa so as to allow for greater participation of the black community. If South Africa were to be allowed to participate in international meets, not only would the participation be confined to whites and be unrepresentative, but there would be no real pressure on sporting bodies to incorporate the changes which alone would encourage black involvement in sports.

It may be argued that participation in sports is in any case the privilege of a few in most third world countries where covert social and economic discrimination ensures that access to sports is not available to the large majority. And international sporting bodies have never bothered about this enough to encourage their members to widen the base of sporting activity. However, in the case of South Africa where racial discrimination is not only overt but is state policy, international bodies have a special responsibility which has not been discharged merely with the banning of South Africa in the past. If apartheid is to be discarded, the international sporting, cultural and intellectual communities will have to play a new role now by putting positive pressure on South Africa not only to allow black participation but to introduce positive discrimination to make that objective a reality.

BHOPAL DISASTER Operation Burial

WHATEVER be the pronouncements of the government and whatever the stated intentions of political parties, there is increasing evidence that every effort is being made to bury the Bhopal disaster once and for all. There is, for one thing, the

growing attempt to suppress information—whereas earlier one could at least gain some access to research findings, even if these were very limited, now it would seem the authorities are making no pretence of being open. For instance, a recent request from this weekly for a copy of the annual report of the Bhopal Gas Disaster Research Centre, a unit of the ICMR, has been rejected on the grounds that "the publication of papers on Bhopal prepared by the ICMR, etc, require clearance of the Technical Committee constituted by the ministry of petroleum and chemicals". This means that information on the status of research studies on Bhopal is virtually unavailable. The added absurdity is of course the fact that the annual report of any of these institutions is only a carefully edited review which tells the reader precisely nothing.

What makes this intense secrecy alarming is the persistent rumour that the ICMR has decided to shelve the ongoing studies on MIC. While the project authorities have in interviews with journalists denied the rumours, there is no way to check on this because the ICMR has not made known the conclusions reached after the long overdue major review it undertook recently. It may be pointed out here that the only beneficiary of this move would be the Union Carbide, because there would then be no way of directly establishing the toxicity of the gas which leaked out of its Bhopal plant. It is in this context that the project director's statement that the all medical research papers are being whetted by the department of petroleum and chemicals is intriguing.

In addition to all this are the frequent reports of the State government's various attempts to obliterate the data base by demolition of the hutments in the gas-affected area ostensibly as a part of its slum improvement programme. Only recently over 3,000 hutments have been so demolished and the residents moved to colonies outside the city. In effect this means that there would be no gas-affected population to speak of. More importantly it makes a mockery of the much publicised basis—easy access for the gas-affected population—on which the health infrastructure, such as it is, has been designed. Such moves would also obviously affect the mobilisation of the gas victims and strike at the organisational efforts of groups like the very vocal Gas Peedit Mahila Udyog Sanghatana. With members scattered far and wide, these groups would collapse. If this trend is allowed to persist not only will the already faint collective memory of the disaster fade from people's minds, but all the physical evidence will have either been obliterated or irrecoverably scattered.

TWENTY YEARS AGO

EPW, July 10, 1971

Neither the report of the Committee on Differential Interest Rates nor the Minute of Dissent appended to it really comes to grips with the problem of how the instrument of credit could be used to help the 'weaker sections' of society. The majority report aims really at maintaining the *status quo*. Faced with the finance minister's public commitment, made at one of his meetings with bankers last year, that commercial banks would charge lower interest rates on loans to certain categories of borrowers, the majority report is quite clearly concerned with making this ministerial commitment as meaningless as possible. Its attitude throughout is that of finding problems for every solution...

If one looks beyond the banks and the co-operatives, it will be immediately apparent that there is already a differential interest rate system for credit prevalent in the country. The so-called 'unorganised' market for credit has been the despair of all those who have surveyed the country's monetary system. The extent of the operations of private moneylenders has been the subject of various guestimates and in agriculture, at any rate, it has been officially conceded that at the beginning of the Fourth Plan, after decades of effort to promote co-operative credit, the moneylender still supplied two-thirds of aggregate credit. The interest rates charged by the moneylender vary, but generally they are a multiple of the highest rates charged by the banks or co-operatives.

To strike a blow on behalf of the 'weaker sections', what is necessary is to reduce the interest burden on (i) the small borrower with viable projects who now depends on the moneylender; and (ii) the potential small borrower with viable projects who is deterred by the high rates of the moneylender's extortions to rates, but has no access to the banks or the co-operatives. This can be done (i) by so expanding the supply of credit through the banks in relation to the total demand for credit in the economy that the moneylenders' interest rates are forced down; and (ii) more selectively, by banks lending more to those sections who now depend on the moneylenders. The latter would require banks to increase the flow of funds to those sectors which are relatively more dependent on the moneylender and, further, within these sectors, pick out those categories of borrowers who have so far had little or no access to bank funds.

Demand Constraint to the Fore

Kumaran Pola

BATA INDIA's domestic business during the year ended December 31, 1990 was seriously affected by the disturbed law and order situation in different parts of the country, especially in Punjab, Jammu and Kashmir and the north eastern states. The directors are anxious about the decline in the disposable income of the middle class which forms the backbone of the company's business in the wake of inflation which worked out to be over 12 per cent per annum. The problem was compounded by the sharp increase in the cost of almost all raw materials and in operating expenses. Because of the fear of a further decline in sales volumes, the cost increases were not passed on to the consumers.

In view of the uncertain conditions in the domestic market, the company focused on the development of export business. Export sales amounted Rs 13.29 crore during 1990 compared to Rs 8.11 crore during the preceding year. Most of the

company's exports were to free currency areas such as North America and Europe. Exports of merchandise manufactured by third parties registered an improvement at Rs 5.05 crore in 1990. The combined exports increased to Rs 18.34 crore from Rs 11.94 crore. As against this, the foreign exchange outgo amounted to Rs 5.65 crore during 1990 as compared to Rs 5.95 crore during the preceding year. Of these, the largest amounts of Rs 5.06 crore in 1990 and Rs 5.60 crore in 1989 were spent on importing raw materials, spare parts and components and capital goods. The imported raw materials, spare parts and components represented 5 per cent of the total consumption in both the years. The company spent Rs 1.94 crore on research and development during 1990. This represented 0.55 per cent of its turnover. The areas in which R and D was carried out included process and materials development and leather technology. The company developed cold moulded insoles, moulded rubber unit soles and PVC unit soles with leather insert. The directors claimed the value of production based on in house R and D in 1990 at Rs 22.10 crore worth of shoes numbering 44 lakh pairs and Rs 7.80 crore worth of upper leather totalling 2.26 crore KVT. The company developed the ability to use rubber sole in place of PVC or vice versa depending on economic considerations without adversely affecting the value of products or presentation. R and D efforts resulted in energy conservation too. According to the directors, energy conservation measures resulted in an annual saving of Rs 39 lakh or 7.7 per cent of total cost of energy in 1989. The apparel and garment business improved and accounted for 10 per cent of retail sales.

An amount of Rs 5.59 crore was spent by way of capital expenditure as against Rs 3.40 crore in 1989. The expenses were largely on modernisation of the company's retail outlets and factories. A new highly versatile Simpapak 18 station bicolour injection moulding plant has been installed in the company's premier factory at Bangalore for the production of 'state of the art' injection moulded shoes with synthetic and textile uppers and specially developed PVC compounds as soiling material.

The highlight of the company's financial performance during 1990 was the improvement in its return on investment from 2.77 per cent to 5.35 per cent. The company improved the return on owners'

equity considerably. It was the smart rise in the net profit margin on sales, rather than the assets utilisation ratio (sales/assets) which declined during the year, that helped the rates of return. The company was able to bring down its debt/equity ratio from 1.86:1 in 1989 to 1.48:1 in the latest year and raise its interest coverage ratio from 1.73 times to 1.77 times. The current ratio at 2.15 as against 2.53 in the preceding year reflected pressure on the working capital. There was accumulation of finished goods inventories as also unpaid sundry creditors.

UTI

Many Landmarks

The year ended June 30, 1991 was a year of achievements for the Unit Trust of India (UTI) on several fronts. The UTI set several landmarks during 1990-91. It crossed the target of one crore unit holders. The investible funds crossed the Rs 20,000 crore mark. A single scheme, i.e. Monthly Income Scheme with Growth 90 (II), netted more than Rs 1,000 crore. Similarly, the UCS 2000 brought in more than 10 lakh unit holders. The UTI introduced as many as six new schemes in a single year, three of which were growth oriented schemes. The UTI mobilised over Rs 4,000 crore (excluding sales to corporate sector under Unit Scheme 1964) during 1990-91 as against Rs 2,700 crore mobilised during the preceding year. The sale of units to the corporate sector under US 64 scheme declined from Rs 2,813 crore to Rs 353 crore.

Three new growth schemes were offered by the UTI in 1990-91, namely, Unit Growth Scheme 2000, Master Equity Plan and Mastergain. Also, three fixed-income schemes were offered, namely, Deferred Income Unit Scheme, Monthly Income Unit Scheme with Bonus and Growth 1990 (MISG-90 II) and Monthly Income Unit Scheme with Bonus and Growth 1991 (MISG 91). A special Odd Lot Scheme was introduced as a service to odd lot shareholders and debenture-holders for converting their odd lots into units of UTI schemes.

Dividends under all the ongoing schemes have been raised. Dividend under the Unit Scheme-1964 has been stepped up from 18 to 19.5 per cent improving the yield on the July price this year from 13.4 per cent to 14.2 per cent. In Mastershare, the pioneer equity based scheme floated by UTI, a bonus of 1:2 has been declared in addition to maintaining the dividend at 18 per cent. Dividend rates under other two open-ended schemes, viz. Children's Gift Growth Fund 1986 and Parents' Gift Growth Fund 1987, as also the other

Balance sheet analysis by Manisha Chhetri

close-ended schemes, have been as per the provisions of the schemes. Bonuses of 5 per cent and 1.75 per cent have also been announced under Children's Gift Growth Fund (on completion of five years of operation) and Monthly Income Unit Scheme-9 (on completion of three years) respectively.

In keeping with the objectives of promoting equity cult among the investors and bringing about an orientation in favour of individual investors, three growth oriented equity based schemes, viz, (i) Unit Growth Scheme-2000 (UGS-2000), (ii) Master Equity Plan (MEP) and (iii) Capital Growth Unit Scheme (Mastergain), were introduced this year, besides having two series of the popular Monthly Income Unit Scheme, viz, MISG-90 (II) and MISG-91, as also an innovative scheme, Deferred Income Unit Scheme, that defers income in the initial years and provides higher income in subsequent years. The UTI also started from October 1990 a scheme for unitisation of 'odd lots' of shares and debentures. It is operated from Bombay, Delhi, Calcutta, Madras and Ahmedabad and presently covers 245 shares and debentures.

UTI invested Rs 4,229 crore in equities (19.8 per cent of investible funds) while the total investment in the corporate sector has been Rs 12,775 crore, i.e., 61 per cent of total investible funds. The sanctions increased by 66.7 per cent from Rs 1,487 crore to Rs 2,479 crore while disbursements increased by 42.5 per cent from Rs 1,025 crore to Rs 1,461 crore. In order to reach the goal of one crore unit-holders, the UTI devised a marketing strategy that could bring as many as 3.5 million applications in a single year.

The India Fund with £ 94.2 million (inclusive of rights issue) which the UTI floated in 1986 has been performing consistently well and in fact has appreciated to £ 235 million. The second international fund of the order of \$ 60 million had its NAV at \$ 14.18 on May 31, 1990.

The Mastershare scheme has been very popular. Besides offering a rights issue earlier, issue of bonus shares has been declared this year in the ratio of 1:2. The dividend has been maintained at 18 per cent. Its NAV stood at Rs 37.21 as on June 19, 1991 indicating a growth of 272 per cent over the last four and a half years. The value of total assets held by the fund is to the tune of Rs 843.65 crore. It has also been decided to extend its tenure by 10 more years, i.e., up to October 2003. However, investors will have the option of withdrawal at NAV based repurchase price after expiry of the stipulated period of seven years on October 19, 1993.

ANDHRA BANK All-Round Growth

ANDHRA BANK continued to record good progress among the nationalised banks during the year ended March 31, 1991. The bank improved the owned funds position as also deposits and advances. It also introduced various schemes for providing better service to its clientele.

The total deposits of the bank stood at Rs 3,534 crore at the end of March 1991. The average aggregate deposits increased from Rs 2,560 crore in 1989-90 to Rs 2,890 crore in 1990-91, recording a growth of 12.9 per cent. During the year, the total number of deposit accounts increased to 70.84 lakhs from 65.42 lakhs and the deposit account in size group of up to Rs 5,000 per account constituted about 85 per cent of the total deposit accounts. To mobilise additional resources, the bank introduced two new schemes during 1990-91—'Kisan Mitra' for the benefit of farmers and 'Medi-Claim' with medical insurance benefit to depositors with low premium.

The total advances of the bank rose from Rs 1,683 crore to Rs 1,888 crore, recording a growth rate of 12.2 per cent. The credit/deposit ratio stood at 53.42 per cent at the end of March 1991. The number of borrowal accounts of the bank at the end of March 1991 was about 12.77 lakhs and accounts in the size group of up to Rs 10,000 constituted 81 per cent of the total. With 71 per cent of offices located in rural and semi-urban areas, the bank continued its thrust towards rural development. Total priority sector lendings stood at Rs 724 crore at the end of March 1991. The number of borrowal accounts under the priority sector stood at 7.86 lakhs accounting for 62 per cent of the all borrowal accounts of the bank. Credit assistance to weaker sections was Rs 192 crore at the end of March 1991 with 5.42 lakhs borrowal accounts and

exceeded the target of 25 per cent and 10 per cent of priority sector and net bank credit, respectively. The bank's assistance under the New Twenty Point Programme was Rs 571 crore with 7.31 lakhs beneficiaries at the end of March 1991. Advances outstanding under the DRI scheme stood at Rs 17 crore with 82,000 borrowal accounts constituting 1.01 per cent of the total bank credit of the previous year of which Rs 6.8 crore was extended to SC/ST beneficiaries which worked out to 40 per cent of the total. Under the Integrated Rural Development Programme, the bank has provided financial assistance to the extent of Rs 8.43 crore during the year. The outstanding amount under IRDP at the end of March 1991 stood at Rs 35 crore with 1,41,000 borrowal accounts.

In accordance with the guidelines issued by the government of India, the agriculture and rural debt relief scheme, 1990 has been implemented by all eligible branches, providing debt relief to 1,70,770 beneficiaries with an amount of Rs 48 crore by the end of March 1991.

The bank handled a total foreign exchange business of Rs 3,104 crore, comprising exports, imports, remittances and inter-bank transactions for the year ended March 1991. The outstanding export credit reached a peak level of Rs 91.23 crore and stood at Rs 75.64 crore on March 31, 1991. Non-resident deposits at the end of March 1991 stood at Rs 49 crore. Credit card business during the year 1990-91 crossed Rs 95 crore.

During 1990-91, the bank floated a wholly owned subsidiary called Andhra Bank Financial Services for undertaking activities such as merchant banking, leasing, hire purchase, etc. The bank also floated AB Homes Finance, a housing finance company. The bank joined with Canara Bank in promoting CanBank Factors, a factoring company which is to be launched shortly.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues, have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

Sachdevya91

Calcutta Diary

AM

The sympathy factor has temporarily saved the day for the party of the Nehru-Gandhis. But few expect the Congress(I) to be able to maintain its facade of unity beyond a few months; the season of assessing permutations and combinations of loyalties would then resume. Another referral to the electorate would be unavoidable. Should the premier political party's survival be regarded as of overriding importance for ensuring the survival of the nation, another assassination would evidently be called for.

THESE are liberalising days. Why not a free float for the imagination too? So here goes.

In the just concluded elections, the Congress(I) party has secured a lesser proportion of the total votes cast than it did in 1989. Had Rajiv Gandhi not been killed, the party's share of the vote, it is now obvious, would have fallen further, and it would have won at least 70 less seats in the Lok Sabha than the number it has actually won. Its aggregate tally would then not have exceeded the scraggy figure of 150 or thereabouts. In such circumstances, the Congress(I) might have ceased to be the country's first party. To call upon it to form the government would have been awkward for the president, and he would have been constrained to look toward the direction of either the National Front-Left Front combination or the Bharatiya Janata Party. In that kind of dicey situation, Rajiv Gandhi would have been in trouble. He would have led his party to two successive electoral defeats, the second even more comprehensive than the earlier one. Discontent with the manner he had conducted its affairs would have grown vocal in party circles. He might then have resigned the party presidentship on his own; were he to show some reluctance, he could even have been shown the door. The Nehru-Gandhi primogeniture would thereby have come to a whimpering end. Let us be candid about it, Rajiv Gandhi did not possess even one per cent of the political acumen his mother had; he also lacked the gutsiness she was famous, or notorious, for. The odds against his charging back to the command of the party would thus have been high. He might at most have succeeded to lead a rump of it. The prospects would have appeared so bleak that even the majority of the caucus would have left in search of other pastures. There would be little point in lamenting. An authoritarian outfit, which had dispensed with all democratic procedures, was unlikely to go on for ever. It would

be hardly surprising if it met its nemesis this harsh way. Rajiv Gandhi would have joined the ranks of former prime ministers fast crowding New Delhi's alleyways. This is the flip side of it. Had Indira Gandhi's offspring not been blown up by the assassin's explosive, he would have been instrumental, because of his electoral non-success, for the country's trek back to a democratic milieu, one where nobody is more equal than anybody else.

Whatever will not be will not be. The killing put paid to that possibility. Those extra 70 seats the sympathy factor yielded has ensured the Congress(I) party's continuance as the nation's premier political outfit. The government it has formed does not look very comfortable; but the point is its having been able to form the government at all. All is seemingly well that ends well. The consensus rides once more. The shouting brigade too is re-flexing its muscles. Within 40 hours of his induction, the new prime minister solemnly makes his pilgrimage to the shrine of that great Indian, Sanjay Gandhi. The Nehru-Gandhis, besides, have by now bagged, in a row, three Bharat Ratnas. Thank goodness, the murder came about when it came about. Without it, it would have been touch and go. All the pieces have now fallen into their places; the happy days are here again. Should this tranquillity prevail for some more time, the government, a-wash with gratitude, might decide to award the Bharat Ratna to Sonia Gandhi too; the citation would, predictably, refer to the fortitude and courage she showed in meeting the tribulations recently visiting her. Anything is conceivable in the country's toady-infested milieu.

All this is however only a half-depiction of India tomorrow. These are liberalising days, it would be grossly unfair to terminate the speculation at mid-point. The Congress(I) is back in power, but the country's problems will not go away. That party, someone would sooner or later in-

sist to insert in the records, is in fact the country's major problem. It is responsible for the mess in Kashmir. It has single-handedly ensured Punjab's alienation from the rest of the country. No outsider yet knows the sort of a deal it has struck with the ULFA or Bodo insurgents. Its return to power in both New Delhi and Dispur could nonetheless provide the necessary impetus to the squabbling factions of the Asom Gana Parishad to come together and try a repeat of the Nellie-type adventures. The greed for power and pelf on the part of Congressmen has already made the landscape in Tripura murky beyond description; even grimmer things might follow. The Congress(I) is unlikely to have the slightest clue how to tackle any of these developments. The sympathy wave is in due course going to exhaust itself, but depredations under the cover of the Armed Forces (Special Powers) Act are going to continue, fortifying the resolve of some fiercely dedicated young people in different parts of the country to take to the Kalashnikov. enough is enough.

Meanwhile, the Congress(I) government, its minority status notwithstanding, would have signed on the dotted line accepting all the conditionalities set by the International Monetary Fund. The outcome would be unsavoury, precisely in the manner all official economic decisions taken in the course of the past decade has been unsavoury, *vide* the confession of the new finance minister. Given the Fund's insistence on further import liberalisation and its encouragement of the devaluation of the rupee week after week and fortnight after fortnight, the line of credit it would finally agree to extend would not be of much help. Imports would continue to flow gushing in, the rupee cost of imports would keep climbing, exports would remain sluggish as in the past, the balance of payments problem would become increasingly more intractable. The Fund would also demand an across-the-board increase in administered prices and heavier imposts of indirect levies; none of these would help the restoration of internal price stability. The Fund would ask for a severe reduction in subsidies, the gradual dismantling of the public distribution system, the phasing out as much of social welfare-type of public activities as of various employment-creating rural works programmes, and the earmarking of all household savings for private investors. The new finance minister has already accorded diplomatic recognition to the supposed symbiotic relationship between transnational corporations and updated technology, and condemned the East India Company syndrome native econo-

mists suffer from. Whatever the Fund would demand would be granted to it, even a wage freeze and a new regime of beastly-sounding anti-trade union laws. Double digit inflation would aspire higher and higher, so as to reach the three-digit mark. The consequence is bound to be widespread social discontent; instead of stabilisation, we are likely to experience greater instability across-the-board.

Every day, new trouble spots would be added to the old list. The People's War Group could be further emboldened by the developments, reducing the administration in Andhra Pradesh to a non-functioning entity. Should Jayalalitha preside over the government in Tamil Nadu much in the temperamental manner she has been wont to run her party, that state too would be on the skids. There is little purchase in not being realistic; what is often lazily described as Dravidian nationalism could be more potent in the long run than remorse felt at a ghastly killing taking place on the soil of Tamil Nadu. Sooner or later, some of the trickles from out of the sympathy ducts could then again begin to flow toward the direction of the ethnic Tamils in Sri Lanka, harassed and hounded in Sri Lanka and undergoing the trauma of an equally bitter hostility in India as well. At that juncture, some ancient and not so ancient history might once more assume relevance. The Liberation Tigers of Tamil Eelam had amongst their earliest patrons in this country not just Indira Gandhi, but Jayalalitha's departed master and hero, M G Ramachandran too. That rediscovery could cause a certain embarrassment. The rationality of the human mind nudges itself to support the cause of whoever happen to be at the receiving end of an unfair stick. So it could well be a different kind of tomorrow for Tamil Nadu from what is being currently promised from the Poes Garden balcony.

Once the Fund and the world Bank really get going with their conditionalities, the poor and the middle classes would begin to feel the pinch. Such is the essence of natural justice: the under-privileged always have to account for the profligacy of the comfortably placed. The town cynics are nonetheless not going to be deterred. As the economic difficulties mount, they might even have the temerity to make fun of the claim of supreme sacrifice, in the cause of the nation, filed on behalf of the Nehru-Gandhis. Are not the two assassinations, felling first the mother and, after an interval of seven years, the son, linked to a whole lot of other episodes? Suppose some cheeky individual were to pass the comment that

while he acknowledged the futility of individual terrorism and personalised political murders, he could still not quite not feel like commiserating with people grievously wronged by the policies and practices indulged in by Indira Gandhi and her offspring. It would certainly be a strain to defend the point of view that what the Nehru-Gandhis did in Punjab or Kashmir or the north-east or Sri Lanka had advanced the nation's interests in any manner. Opening the gates of Babri Masjid, blessing the *shilanyas* and Rajiv Gandhi's pitch for Ram Rajya in the November 1989 elections apart, the Ramayana-Mahabharata weekly serials on the Doordarshan were among the Congress(I) party's principal contributions to boost the cause of fundamentalism in the country. The Bharatiya Janata Party can take only a modest credit for its spectacular advance; most of that accolade really belongs to the Congress(I).

The sympathy factor has temporarily saved the day for the party of the Nehru-Gandhis. But its fortune and the nation's are now inversely correlated. True, not much confidence can be reposed in an electorate which votes one way in case there is a freak shower and another way if there is none. Kerala has provided the concretest evidence of the rate of literacy,

for example, having little to do with the level of social awareness. But these are short period contretemps. The law of historical inevitability would still come into its own. Developments in the economy and the polity apart, a minority government has to conform to its own whimsical law of thermodynamics. Few expect the Congress(I) party to be able to maintain its facade of unity beyond a few months; the season of assessing permutations and combinations of loyalties would then resume. Another referral to the electorate would be unavoidable. Should the premier political party's survival be regarded as of overriding importance for ensuring the survival of the nation, another assassination would evidently be called for. Perhaps an insertion placed in the newspapers, inviting suggestions on whom the choice might lie, could help. Once that matter is satisfactorily resolved, some guns could be hired, and history would be cheated again.

Most of the above comments, it will be said, exhibits bad taste. Perhaps the environmental pollution is showing up. How much of civility can you expect in a situation where a street lout is officially enshrined as one of the nation's foremost leaders?

APPOINTMENTS

GOVIND BALLABH PANT SOCIAL SCIENCE INSTITUTE, ALLAHABAD

Advertisement No. 6/1991

The Institute invites bio-data from social scientists, for a few positions of Senior/Visiting Fellows to pursue independent research on a subject of their choice in their respective area of specialisation for a period of two years. A Senior/Visiting Fellow shall be an eminent scholar preferably of the rank of a Professor, or a Senior member of the Indian administrative service who may be interested in carrying out research in any area of public administration at the Institute. The Senior/Visiting Fellow shall also submit a research proposal for the consideration of the Selection Committee alongwith his bio-data. The Senior/Visiting Fellows will be entitled to salary protection/deputation allowance besides DA and other allowances as per rules of the Institute. Retired social scientists or Government Servants shall be paid salary and allowances on the basis of the last pay drawn. For further particulars please write to the Registrar.

Restructuring the Economy: Pitfalls and Possibilities

Iran Ghosh

Self-reliance does not mean autarky, nor blind import substitution. It does mean, however, that the country should learn to live within its means, that domestic savings should be raised to the level of domestic investment, that the distribution of income should be less inequalitarian so that the thrust for the development effort comes from the consumption demand of the masses.

In the past few days, the government of India has announced far-reaching changes in India's economic policy. The rupee has been devalued by around 20 per cent. The export-import policy has been completely revamped: cash compensatory support (CCS) to exporters has been abolished; all exporters will be allowed import licences (RUP) worth 30 per cent of the value of exports which would be freely saleable; and JGI imports as well as much of restricted (U) licensing has been abolished. Further policy changes—particularly in respect of industrial licensing policy—are on the anvil, and foreign investment up to 51 per cent may be freely allowed (subject to a short negative list).

This package of reform is stated to be essential for getting a loan from the IMF to bail the country out of the present foreign exchange crisis.

What has been done has been done, even though the drastic action taken has been without consulting either parliament or the opposition parties. In a sense, there is no going back. The issue now is: what are the likely consequences, and what remedial steps are necessary in order that the country does not get caught in an inexorable external debt rap.

First, as per the World Bank's latest figures, the external debt of India today exceeds \$ 70 billion. At present exchange rates, this comes close to Rs 200,000 crore. This is a mixed package, with varying repayment periods and interest rates. Nonetheless, payment of interest and repayment of capital may now be well nigh Rs 15,000 crore per annum or possibly even more. With the GDP at around Rs 400,000 crore, the external debt repayment liability alone may be shaded under 4 per cent of the GDP.

Today we have a current account payments deficit of anything between 2.5 per cent and 3 per cent of the GDP. What we need is a surplus of something like 4 per cent of the GDP (if further aid is not taken into consideration). The IMF is likely to come up with a loan of \$ 2 billion immediately, and a further loan of some \$ 5 to 7 billion on liberalising the economy. The conditions

would be: (a) a sharp cut in the fiscal deficit of the government of India; (b) reduction of import duties and gradual lifting of all quantitative restrictions (QRs) on imports; and (c) privatisation of the economy, together with free inflow of foreign capital. The consortium countries give us a *gross* aid of around \$ 5 billion per annum, but much of it is 'tied' to purchases from the donor countries.

Two points need to be made at this juncture. First, after the recent curbs on imports, India had started (over the past few months) having a small surplus on merchandise trade account, the deficit in the balance of payments arising from (a) imports on government account especially of defence equipment and civilian aircraft, etc; and (b) debt repayment liability. Secondly, the sort of import curbs imposed through the RBI's policy on 'margin requirements' (for imports) are not really sustainable; it would have hurt our exports badly and what we really needed was a selective cut in imports and a boost to exports.

In the above context, the export-import policy recently announced by the commerce minister is really the type of policy that should have been announced, with a *moderate* (and flat) CCS rate. Was devaluation really necessary because: (a) government imports are 'autonomous', and really depend on government policy, including the extent to which we can depend on diplomacy to reduce a competitive arms race, and (b) a sharp devaluation is likely to turn the barter terms of trade against the country, and increase the external debt liability (in rupee terms) which implies that a larger percentage of our GDP would now be required to repay our external debt liability?

Reportedly, the further policy changes contemplated are removing diverse restrictions on the licensing system and allowing foreign firms to invest up to 51 per cent equity (other than for a short negative list). Of late, both our industrial licensing and import licensing systems had become highly complex, and their *simplification* has been a highly desirable objective. But, in regard to the induction of foreign capital, one needs

such capital only where we need technological upgradation, as in capital goods and basic intermediates, or in any area where foreign capital is intended for export production, that is, where there is a substantial net foreign exchange gain (as insisted on by China which has lately been obtaining foreign capital in the region of \$ 8 billion per annum, on the above stipulation, namely, that exports exceed all imports and remittances of profits and interest).

But the basic point that arises today is: what type of fiscal restructuring is in the offing, consequent on a large borrowing from the IMF/World Bank? Are we opening up the Indian economy in the interests of some 100 million affluent Indians? What is to be the policy for the rest of the 750 million? How do we restore productivity of the land in 70 per cent of the cultivated area dependent on dryland farming? How do we provide employment to the currently unemployed and underemployed population? How do we raise the level of education, health, skills, and the income of the hitherto depressed sections of society? Can we have an employment guarantee programme entrusted to the local panchayat bodies, through transfers via the states (for the 43 per cent of the people below the poverty line)? Such employment guarantee would be predicated on the minimum wage being payable for eight hours' physical labour? But the programme cannot be implemented without decentralisation, without massive devolution of both authority and funds from the centre. Such employment guarantee can be easily funded by cutting down diverse overt and covert subsidies calculated to help the more affluent sections of the population. (For example, the students in the IIMs and the IITs are subsidised to the tune of some Rs 1 lakh per student per year. There are lots of similar examples.) Can we reduce such subsidies in favour of a programme which would help to sustain the income of the poor, provide a minimum of education and health facilities, provide maternity and child care, provide for the supply of drinking water and a minimum of energy at affordable prices to all sections of the population? In short, what is the policy package that the finance minister has for reducing the fiscal deficit?

That is the fundamental task of restructuring the economy, namely, raising the productivity of the entire workforce. Inviting

multinationals is not. We have had 100 per cent foreign investment (until FERA 1974) in tyres and tubes, in Firestone and Good-year—I am not mentioning, Cadbury, Colgate and Coca Cola—but did we get the latest technology in tyres and tubes? One could take hundreds of similar illustrations. Did we get any foreign technology for our nuclear and space programmes where we have made progress? When has our industry encouraged R and D and indigenous design engineering? Has the government done anything to follow up on its 1973 Technology Policy? The multinationals are in the business of making money for themselves and, depending on the tax structure of different countries, resort to 'transfer pricing' with headquarters located in tax havens. After all these years of experience of handling foreign capital, foreign aid, and the pressures of 'profit maximising' predators who want to make money through arbitrage and brokerage, how can our economic policy makers be so naive as to think that the Indian economy—steeped in lack of education, malnutrition and ill health, and labour laws (for organised labour) which parallel those of developed countries with no help or redress to the millions of unorganised workers—will become a haven for foreign capital?

As indicated earlier, what has happened has happened. The simplification of the trade regime and the industrial licensing system are long overdue reforms. They could have been initiated without IMF intervention. One can understand the rationale of a small loan from the IMF to bail us out of the trouble which commenced from around 1985. In fact, the external debt repayment liability of the country was 8 per cent of exports in 1980. It now exceeds 30 per cent. We need to resile from the policies that led to the present bankruptcy in external payments between 1985 and 1989, rather than have more of the same.

What we need today is to renew the faith of the people of this country. That faith can come only from self reliance. By the way, self reliance does not imply autarky, nor blind import substitution. It does mean, however, that the country should learn to live within its means. It means that domestic savings should be raised to the level of domestic investment. It could lead to the need for more of our politicians and businessmen travelling by train, rather than make frequent trips between Delhi and the state capitals by air. It implies that the distribution of income should be more egalitarian so that the thrust for development effort comes from the consumption demand of the masses. Pandering to the demands of the elite 100 million people who control the media is not likely to solve the problems of the country.

Most importantly, the protagonists of a large loan from the IMF should pause and consider how precisely a current account deficit of \$ 3 billion is likely to get converted into an equivalent surplus in about three to four years from today.

GIRI INSTITUTE OF DEVELOPMENT STUDIES

LUCKNOW

The Institute wishes to recruit Faculty at the level of Professor, Senior Fellow and Fellow carrying UGC Scales of Pay for Professor, Reader and Lecturer.

Prospective candidates should have a doctoral degree in Social Sciences, preferably in Economics, Sociology, Political Science, Geography and Social and Economic History or independent research experience as evidenced by published work with a good academic record and research and/or teaching experience of at least five years for the position of Senior Fellow and ten years for that of Professor. Besides competence in their own disciplines, candidates should also preferably have aptitude and inclination for inter-disciplinary research.

Interested candidates may send their applications containing details of qualifications, experience and publications along with names of two referees to the Director, Giri Institute of Development Studies, Sector O, Aliganj Housing Scheme, Lucknow 226 020 by September 7, 1991.

NEW DELHI

Fund-Bank's Grand Design for India

BM

The World Bank-IMF strategy seems to be to create conditions in which India will be forced to default on its foreign payment obligations, albeit for a short period, before the purse-strings are loosened for the grant of credits. That way, it is expected, any residual reluctance to agree to the most damaging conditionalities will be wiped out.

THE Congress(I) minority government headed by P V Narasimha Rao has moved fast, indeed recklessly. All reservations on economic policy have been thrown overboard. It has proclaimed its readiness to abide abjectly by the World Bank-IMF prescription in embarking on the so-called structural adjustment programme.

Inducted into the union cabinet, in a surprise move, Manmohan Singh is showing extraordinary enthusiasm for the structural adjustment programme. This has won him plaudits from some media and academic circles. There is no doubt either that he is trying hard to fit quickly into the political frame in which he has now to operate. This is emphasised by his joining the queue to pay obeisance to Sonia Gandhi.

Manmohan Singh was rather impetuous after assuming charge as finance minister when he rejected the feasibility of the Congress(I) manifesto itself on the ticklish question of prices. He will obviously have to learn the hard way. That he is trying could be seen from the way he handled the devaluation of the rupee in two instalments within three days.

The Congress(I) manifesto had put the rolling back of the prices of essential commodities, in particular of diesel, kerosene, salt, edible oils, cycles and two-wheelers, electric bulbs, cotton sarees and dhoris, stoves, including smokeless chullahs, newsprint, post cards, inland letters and envelopes to the July 1990 level. This was to be the first great achievement within a short period of 100 days. Pranab Mukherjee, when he was still hopeful of taking charge of the finance ministry, had declared that rolling back prices with fiscal and administrative measures would be no problem at all. What he had hinted at was that taxes on the production, sale and purchase of the selected commodities would be withdrawn to bring down their prices for the consumer and penal action would take care of profiteering by the traders. This line on prices is what must have horrified the professional in Manmohan Singh. He could not conceive

of giving away revenue with a huge budget deficit on his hands and at the same time boost the demand for articles of current consumption, especially petroleum products, when there could be no immediate improvement in their supply through imports.

Manmohan Singh's stand on prices made sound economic sense. He had, of course, left it to the Congress(I) leadership to take care of the political-populist implications of his stand. The backlash from vocal party men he has had to endure must have taken him aback. But there are larger dimensions to the problem of prices from which Manmohan Singh has tried to divert attention.

The finance minister has not spelled out the measures he has said he has in mind which would bring down in a three-year period the annual rate of inflation from the double digit level to not more than 3 to 4 per cent. There is no doubt that the so-called 'structural adjustment' of the economy that is proposed to be brought about with the help of a large IMF loan of \$7 billion, which will finance liberal imports of inputs for production and assembly operations, combined with massive inflow of foreign capital will prove deflationary. But the implications of the design of growth and price stability which is being proposed to be adopted can be dangerous. Consumerism for the upper classes and austerity for the people is the formula for the management of prices under the proposed, foreign financed, structural adjustment of the Indian economy.

The situation on the prices front is indeed grim and is likely to worsen with the steep devaluation of the rupee, which is the first specific step taken towards the World Bank-IMF ordained structural adjustment. All factors which might help to maintain relative price stability, especially in the case of wage goods, have ceased to operate in recent years. The adverse impact of reckless deficit financing cannot be absorbed year after year without disturbing price stability. A tight balance

of payments position adds to the problem. Resources in foreign exchange cannot be deployed for liberal imports to augment supplies of consumption goods to hold the price line. The stocks in the hands of the public authorities are not providing an effective cushion against upward pressures on the prices of foodgrains, other farm commodities and wage goods generally. While procurement prices have been increased year after year, procurement this year is still not picking up. The insistent elitist demand on resources, which has been mindlessly encouraged by fiscal and monetary policies, has skewed the consumption, production and income pattern both in urban and rural areas. The deflationary impact of the bumper crops has not, therefore, been as enduring as it could have been in response to sound economic policy and management. The response of the industrial sector to the demand generated by upswing in farm production has not been such as to augment the supplies of wage goods. Industry has concentrated on production of goods of elitist interest which fetch large profits. All this has strengthened inflationary pressures in the economy. The result is that the position of the majority of the population has worsened in spite of the relatively high growth rate of the economy and big business traders, speculators, blackmoney operators and those fattening on corruption in the political and administrative machine have monopolised all the gains of growth. The profit margins not only of the producers but also of the traders have been allowed to swell in the system of free play of market forces within the framework of official economic policy and the philosophy of liberalisation and profit-maximisation.

For restoring price stability in meaningful economic and social terms, the need is to curb the draft on resources made by elitist demands and step up investment to augment essential supplies in the economy. It is necessary to curb wasteful expenditure of all kinds, including on the military build-up in a vain effort to assert regional hegemony and seek international recognition on that basis. The so-called liberalisation policy pursued with gusto in the eighties has pushed India towards internal and external debt traps, even as economic growth has been linked to effective, elitist demand in the market rather than the satisfaction of the essential needs of the mass of the people. The path to price stability based on a socially broad-based and equitable growth process cannot, be by way of a market-oriented liberalisation policy financed by conditionality-linked IMF loans and assuring profit-maximisation

opportunities to foreign investment and Indian business interests associated with this investment. What is needed is mobilisation of domestic resources, human and material, for planned development under a socially meaningful and economically sound order of priorities. The devaluation of the rupee by between 18 and 20 per cent has in these conditions set the course so far as the official economic policy orientation is concerned.

The present devaluation may indeed turn out to be far more ominous than the devaluation under a fixed exchange rate regime a quarter century ago. It was in the mid eighties after careful and calculated preparation, that the World Bank IMI combine, working in tandem with the GATT which was preparing for the launching of the Uruguay round of trade negotiations, had drawn up for India a 10 year programme of structural adjustment in which steep and continuing devaluation of the rupee was given a prominent place. The then government of India was invited to implement this programme and complete it by the mid nineties. Generous financial backing was assured for the purpose. This is what the shrill cry of ushering in the 21st century was all about. The devaluation of the rupee now announced represents a giant step forward in that direction. The ouster of the Congress(I) from power in 1989 had created some problems in the way of the smooth working out of the programme. But on its return to power, though with a much reduced strength in parliament and authority among the people, the Congress(I) leadership appears to be anxious to complete its obligation to the international financial institutions in the remaining three years as originally stipulated by the World Bank IMI combine. The minority government headed by P V Narasimha Rao has found itself under such a squeeze that it has been compelled to take the politically most obnoxious of measures, namely devaluation of the rupee well before the presentation of the budget for 1991-92 embodying the conditionalities attached by the IMI to the loan which is being negotiated in support of the World Bank IMI programme of structural adjustment.

It is really pathetic that both the prime minister and the finance minister have made statements that the IMI had nothing to do with the devaluation of the rupee and that the devaluation had been decided upon by the Reserve Bank of India in the normal course of adjustment of the exchange rate of the rupee. The fact, however, is stark that the scale of the devaluation is much too large for it to be a normal depreciation. The devaluation has come in the wake of the continuous depreciation of the rupee under the floating exchange rate system. The first

two instalments of devaluation should be expected to be followed in the normal course once again by continuing depreciation so that the exchange rate of the rupee is fully market related. The World Bank-IMI side seems to be fully enjoying the spectacle that India is presenting as a supplicant for foreign credits. "There were no instructions to the Indian authorities to adjust the value of the rupee", an IMF spokesman is reported to have said cheekily. Mark the word 'instructions' used by him. A World Bank spokesman has, however, said that "we have sent a detailed programme to New Delhi for immediate action, prior to the passing of the budget. Further help to India would depend on the progress of the reform programme". The World Bank does not ask for a specific rate of devaluation he added generously. What is being attempted is to create conditions where India will be forced to default on foreign payments, albeit for a few days or weeks, before the purse strings for the grant of credits are loosened in advance of the signing of the big IMI structural adjustment loan.

All this evidently, is to ensure that conditionalities attached to the IMI loan arrangements are scrupulously and energetically implemented within the stipulated time frame, unlike in the past when broad guidelines were laid down and the performance of the debtor watched. The tentacles of the conditionalities are spread out far and wide so that not only policy but also administrative and management decisions have to be subject to World Bank IMI surveillance and approval. Witness, for instance, the directions that have been given to restructure the ONGC and the financial institutions.

The immediate upshot will be a sharp increase in the rupee cost of imports as well as servicing of old loans. It will be necessary at the same time to export more in volume terms to fetch the same value in terms of foreign exchange. The pressure on prices in the domestic markets will thus increase. There will be no easing of pressure on exchange reserves either so that dependence on foreign credits to manage payments to foreign suppliers of goods, services and capital will increase. The position is so difficult that the two loans taken from the IMI in February have already been exhausted. At this rate a loan of even \$7 billion will not be an adequate cushion to ease the payments position for more than 15 months, especially under a regime of import liberalisation, except by way of financing of imports by commercial credits from different sources. India's vulnerability on the balance of payments front can therefore, become still more glaring.

India now is faced with only two options. One is the acceptance of the World Bank IMI line which will shift the burden

of the development process on to the poor while sacrificing the economic and political sovereignty of the country and, in the process, completely subvert the ability of the system to find an independent alternative. The other, as a group of left economists have pointed out, is to build on whatever little room for manoeuvre is left and move towards a more egalitarian social order that preserves the economic and political sovereignty of the country. The issues and alternatives have to be squarely faced and must not be allowed to be obfuscated by ignoring the specifics of the current economic situation, including the payments crisis. There is need to blow away the myth of horizontal diffusion of technology imported on a continuing basis when it is closely tied to direct foreign investment and collaboration arrangements with comprador Indian business interests to enhance import-intensity of the production structure. There is hardly any scope under such a dispensation for taking advantage of the international division of labour except in so far as it is based on adverse terms of trade. What is prescribed by international creditors for India is the enlargement of the running tribute to be paid by its deprived masses to maximise returns for foreign investment and satisfy the elitist demand of a small segment of the population under a neo colonial dispensation. It is a pity that in recent years even as there has arisen a strong comprador class of big business which is committed to operate within the neo colonial dependency, a large section of Indian intellectuals and professionals have also chosen to toe this line and embellish it with convoluted reasoning.

Lok Sabha Elections and Communalisation of Politics

Asghar Ali Engineer

The blatant, and successful, use of communalism by the BJP in the 1991 elections has to be seen against the background of the use of the communal card by the Congress(I) leaders themselves for their survival in power.

THE 1991 Lok Sabha elections were unique in more ways than one. Firstly, they were held within two years of the previous elections held in November 1989. Secondly, they were in fact precipitated not merely by the withdrawal of support for the Chandra Shekhar government by the Congress(I) but in fact, because of the withdrawal of support by the BJP for the V P Singh government on the Ram Janmabhoomi-Babri masjid controversy in October 1990. This needs to be emphasised because a democratically elected government fell not on a major national issue but on a sectarian religious issue and the BJP saw in this unfortunate controversy a unique chance to come to power. The natural corollary of this unfortunate controversy was the unparalleled communalisation of Indian polity in the post independence period. This communalisation nearly shook the very foundation of Indian secularism. Also, the masjid controversy should be seen not only in its immediate context of implementation of Mandal Commission Report in August 1990 but also in the earlier context beginning from the early eighties. As such the danger of communalisation of Indian polity has always been present in Indian society but it assumed more serious proportions when the Congress(I) leaders themselves began to play the communal card for their survival in power. Indira Gandhi's confidence that she would come to power on her own or her party's merit had been shaken after the Emergency. Muslims and dalits, her traditional supporters had been alienated from her leadership. She began to search for support elsewhere and found it in the politically emerging Hindu middle castes. First she used the Meenakshipuram conversions in 1981 and the political storm it raised to win Hindu support. She also cleverly manipulated the Punjab problem and fully exploited the concern generated among the average Hindus by the militancy shown by Bhindranwale. The Blue Star Operation contributed in its own way in further communalising Indian polity. Rajiv Gandhi also opened his regime with the communal holocaust under his very nose in Delhi in which hundreds of Sikhs perished. He also gave in to Muslim fundamentalists by changing the law on Muslim women and also tried to please Hindu fundamentalists by allowing the

'shilanyas' ceremony in Ayodhya.

This background of events is necessary to understand the recent developments leading to the most blatant use of communalism by the BJP in 1991 elections. When the Congress party resorted to the Hindu card to survive in political power, the BJP felt threatened on its own ground. Until then the Congress had depended on the Muslim and dalit support and BJP on some middle caste Hindus like Baniyas in urban areas. While the Congress used to talk about secularism and protection of minorities and dalits the then Jan Sangh and its later incarnation BJP carried on propaganda for the Hindu interests and there was, in a way, a division of votes among these parties. However, this apple cart was upset when Indira Gandhi and later Rajiv Gandhi began to encroach upon the traditional BJP votes. This competition for the Hindu votes resulted in competitive communalism between the two major parties.

Whereas for the Congress(I), traditionally a secular party, there were limits to resorting to the communal card, the BJP as it was professedly a Hindu party did not shy away from using Hindu interests. Thus pitted against the Congress(I) on the same grounds the BJP had to make its propaganda sharper and woo more Hindu castes. Thus it would be no exaggeration to say that it was use of the Hindu card by the Congress(I) that compelled the BJP to resort to more blatant form of communalism and to cast its political net much wider. Also, it tasted more power in 1989 elections by increasing its strength in Lok Sabha from two to 48 with the support of the Janata Dal. This was a tremendous boost for it. But its dream seemed to be shattering with the implementation of Mandal Commission Report in August 1990.

The BJP in response to the challenges posed by the Congress(I), had cast its net wider and tried to bring various castes under its political domain. It had used the Ram Janmabhoomi controversy as a powerful religious symbol to create a sense of unity among the divergent Hindu castes and it had succeeded in this venture to some extent. Many Hindus often complain that whereas minorities like the Muslims, Sikhs and Christians are united the Hindus are not. Hinduism was thus sought to be sanctified. But this was a

frustrating exercise as the caste hierarchy was the most powerful obstacle in the way of unity. The BJP used Ram as a symbol to rally round all the castes under its banner. It used all sorts of devices for this, it drew up a plan to construct Ram mandir where the Babri mosque stands today, then it gave a call for donation of bricks from all five lakh villages of India, then it drew up plans to take out these donated bricks in the form of processions from villages, towns and cities and it also planned, with the help of the Vishwa Hindu Parishad, to mobilise lakhs of 'kar sevaks' on an auspicious day fixed by Dharm Sammelan in Hardwar.

Thus all possible means were employed by the BJP to strengthen and consolidate its Hindu constituency. But all this was suddenly being brought to naught by the implementation of the Mandal Commission report by V P Singh. The BJP's gameplan for further increasing its strength in the Lok Sabha if not capture actual power at the centre was thus foiled. Hence L K Advani's Rath Yatra in the third week of August 1990. The rath, mounted on a Toyota truck carried the BJP party symbol most prominently thus making BJP's political intention unmistakably clear. Other parties strongly objected to such gross exploitation of religion for political purposes but Advani quietly ignored such objections and protestations. He repeatedly claimed that the 'rathayatra' was undertaken to strengthen national unity and that it is wrong to say that it caused communal bloodshed and claimed that not a single riot took place on its route and that he in all his speeches pleaded for caution and moderation. These claims can hardly stand scrutiny. Firstly, no religious figure, however revered, he may be, can be claimed to symbolise national unity, specially in a multi religious nation like India. If a religious symbol of one religious community is used, other religious communities would but resent it.

Secondly, it is far from true that the rathayatra did not cause communal bloodshed. It would only be indulging in technicalities to claim that no riot took place along the route of the yatra. The yatra evoked very militant religious sentiments among the Hindus and there was a show of unprecedented aggressiveness by the cadres of the BJP, VHP, Bharat Dal and the Shiv Sena in different places and communal violence broke out in number of places in Gujarat, Karnataka, Andhra Pradesh, UP and Bihar. And after the arrest of Advani in Bihar on October 23 all hell broke loose in Jaipur, Jodhpur, Ahmedabad, Bhopal, Hyderabad and several other places in which hundreds of innocent people perished and properties worth crores of rupees destroyed or looted. In Jaipur which otherwise had a unique record of communal peace more than 130 persons died in the last week of

**THE THEORY OF CAPITALIST DEVELOPMENT
Principles of Marxian Political Economy**

by
Paul M. Sweezy

(Original Publisher: Monthly Review Press, New York)

As a work in political economy this book begins with the simplest elements of Marx's thought, his method, use of abstraction and analysis of the commodity and of the relations between labour and capital and concludes with the most complex categories of modern society: the historical tendencies of the capitalist system, corporations, international economy, fascism and imperialism.

October 1990. When the 'yatra' began from Dwarka in Gujarat, a bowl of blood was offered to Advani, his head smeared with blood and hundreds of trishuls and swords loaded on the rath. Minorities could only hold their breath anxiously.

Though the Congress, the Janata Dal and BJP itself published manifestos raising important issues like poverty, unemployment, price rise, economic development, etc., the Ram Janmabhoomi issue was looming large on India's political horizon. The BJP was bent upon exploiting it for its electoral success. It launched a propaganda blitz on these lines. Even though in the meanwhile the Bombay High Court judgment came unseating the Shiv Sena MLAs for having used religious appeal for soliciting votes, it hardly sobered down BJP and the Shiv Sena. Other strategies were drawn up and posters showing Ram mandir and using slogans for Ram Janmabhoomi were now printed in the name of Vishwa Hindu Parishad claiming that it was a separate and non-political organisation. However, it could hardly deceive anyone. The message was loud and clear. Also, the BJP was flush with funds during this election. Its propaganda blitz left even the Congress far behind. Apart from VHP's contributions, it was far easier for the BJP to mobilise funds this time. The bourgeois as well as the petty bourgeois poured money into the BJP election kitty not only because of devotion to Ram but also because of the perception that the party was bound to emerge much stronger in the election. The BJP leadership was also exuding confidence.

There was one more reason for exploiting Ram Janmabhoomi issue to the hilt during this election. The BJP can hardly compete with other political parties as far as secular issues are concerned. It is too far to the right to appeal to the masses as far as its economic programme is concerned. Moreover, it is always under pressure from traders not to advocate radical economic policies and even if it does as a tactical move, the left parties, the JD and the Congress can do so more convincingly. Also, it can never carry conviction with the Muslims, other minorities and dalits even if it makes a mild attempt to woo them.

Thus the only alternative left for it was to exploit religious sentiments of Hindus. The Ram Janmabhoomi controversy came as a political gift from the Congress. It was this controversy which enabled the BJP to penetrate rural areas. It no longer remained the party of banyas in urban areas.

It is really ironical that the leaders of Jan Sangh and then BJP often used to exhort Muslims for being fanatics and for mixing religion with politics. There was great deal of truth in this specially in pre-independence India when the Muslim League, under the leadership of Jinnah,

used religion with vengeance to win 'homeland for Muslims'. In post-independence India the Muslims as a minority soon realised the value of secularism and gave up, in their own interest, communal forms of politics though there were some exceptions to this rule. They voted, by and large for secular parties, chiefly the Congress. And whenever there was anti-Congress wave in the country, they voted, along with others for other parties like the Janata party in 1977 and Janata Dal in 1989 and again in the 10th Lok Sabha elections. But in the last elections the pattern of Muslim voting was more complex. The Muslim leadership, it must be noted, did great damage to the Muslim cause by exhibiting religious militancy during that phase in as much as it further strengthened Hindu communalism. Also, on the Babri Masjid issue, a section of Muslim leadership manifested rigid position and gave a call for a march to Ayodhya to offer Friday prayer there. The then president of Babri Masjid Action Committee Shahabuddin urged Muslims to boycott government functions on Republic Day. This too was wrong morally, strategically and politically. It was exploited by the BJP leaders. Except in these instances the Muslims have not shown organised religious militancy in post-independence India. Yet they come in for strong criticism for mixing religion with politics and manifesting religious fanaticism. Such propaganda had great political value for the BJP as it could convince Hindus that they have no other way but to retaliate in the same manner.

The BJP apart from Ram Janmabhoomi controversy used two other things to gain political legitimacy among the middle and upper caste Hindus: the non-organised nature of Hinduism and the concept of pseudo secularism. Both these paid rich dividends to the BJP in terms of votes, specially in the urban areas. It is necessary to examine both these concepts. It is maintained not only by the BJP but by many other well-meaning Hindus that semitic religions like Christianity and Islam are not only highly organised religions but are also closed theologically and encourage dogmatism and fanaticism. Hinduism, on the other hand, is neither an organised religion nor does it encourage dogmatism, much less fanaticism.

However, such sweeping statements do not make much social sense. Religion cannot be seen in isolation from society. Fanaticism and liberalism are more of social rather than religious phenomenon. It is social conditions which raise or lower degree of fanaticism and not religion *per se*. A religious community (other communities, cultural, regional or linguistic too) tends to be liberal, progressive and non-dogmatic if materially it is prospering, making economic gains, is confident

of itself and has a sense of security. However, it tends to be intolerant, dogmatic and even fanatic if it is passing through a low ebb, losing its privileges or is threatened with the loss of privileges it is enjoying (though it may be in control of the commanding heights of economy) and develops a sense of insecurity. Such dogmatism and fanaticism is also experienced in a political sense during revolutionary period also.

The fanaticism and militancy among a section of Hindus, especially among upper castes in urban areas on the Ram Janmabhoomi Babri Masjid controversy, can be understood only if seen in the above perspective. Though the upper caste Hindus command economic heights, political power and key government jobs, today they perceive threats to their privileges from dalits and backward castes on one hand and Muslims, Sikhs and other minorities, on the other. These upper caste Hindus, therefore, have begun to feel that their liberalism is proving to be their weakness and Muslims, Sikhs and Christians are highly organised and militant and are hence able to exert pressure on the political system. They therefore feel that they too should become organised, dogmatic and militant. Thus it was not Ram but threats to their own privileges which made them and their Hinduism so militant. It is their militancy which mobilised sadhus and religious leaders of various Hindu sects on such a gigantic scale never seen before in the modern history of Hinduism. In fact in number of constituencies in UP the sadhus who were never involved in politics earlier campaigned for the BJP candidates. We thus witnessed unprecedented use of religion for political purposes by these upper caste Hindus. The Shiv Sena and VHP even distributed trishuls in Bombay and elsewhere during election campaign.

The BJP also very aggressively carried on propaganda about what it called the pseudo secularism of the Congress, Janata Dal and the Communist parties. It maintained that these pseudo secularists were following the policy of appeasement of minorities in order to exploit them as their vote banks. This propaganda too had great appeal for middle class Hindus in urban areas. The media also gave it at publicity to these views. It is unfortunate that in major dailies Advani's interviews and statements talking about pseudo secularism appeared every now and then during the election campaign but no serious articles analysing the hollowness of Advani's pseudo secularism ever did. Advani intended to send strong political signals to Muslims and other minorities that they must live in this country on terms dictated by the Hindus.

According to Advani Nehru's pseudo secularism did not protect the Hindu in

terests. It only took care of minority interests. India could be a genuinely secular country only if it opted to be a Hindu Rashtra and only if Hindus could be genuinely secular, all others were either communal or pseudo-secular. They did not even see the obvious contradiction in terms like 'Hindu secularism', 'Muslim secularism', etc. Secularism must be understood in its own terms. It cannot be hooked to any religion or religious community in order to be genuine. But this is what precisely the BJP leaders did.

Appeasement of minorities, on closer examination, is also found to be hollow. All that Advani is able to cite, to prove 'appeasement' of Muslims, is that Muslims are allowed to practise their personal law under which they can marry four wives. The Hindus, on the other hand, have to be content with one wife alone. In the modern world with women becoming more and more conscious of their rights, even bigamy, let alone polygamy, is becoming more and more problematic to practise. A number of surveys have also established that it is much less prevalent among Muslims than among Hindus, though among Hindus it is done illegally. Muslim personal law has been permitted not so much for the appeasement of Muslims as to respect their religious sensibility and sense of security. The world over minorities are allowed certain measures—though they may be socially outdated—in order to give them a sense of security and religious identity. Many changes are overdue but they must be brought about in a persuasive rather than coercive way. The former course can be politically less problematic for a democratic society. Social changes can be hardly imposed from above.

As for Muslims being vote banks for a party, each political party tries to create its own vote banks. If the Congress or lately the Janata Dal tried to treat Muslims as a vote bank, the BJP tried hard to create, among upper caste Hindus, its own vote bank. This is a sort of political tactics each party has to follow in order to win. Some parties may have treated Muslims as vote banks or Muslim leadership may also have traded with this or that party to sell Muslim votes, but Muslim masses have voted quite intelligently both in keeping with their interests as well as country's interests as a whole. If they voted for Congress others were also voting for the Congress in the country. If others voted for the Janata party or Janata Dal during anti Congress waves, Muslims also voted for the Janata party and the Janata Dal respectively in 1977 and 1989 when anti Congress waves prevailed. Some Muslim leaders like the Shahi Imam do try to sell Muslim votes to this or that party which must be strongly condemned. Even the BJP leader Atal

Behari Vajpayee tried to woo the Shahi Imam in 1977 to campaign for the Janata party. But it should be borne in mind that Muslim masses vote according to their own perception of the situation and not because the Shahi Imam tells them to vote for a particular party.

In the 1991 elections the Imam had appealed to the Muslims to vote for Janata Dal. This appeal was quite superfluous as the Muslims were already determined to vote for Janata Dal in general. But this determination was also qualified. Their main intention was to defeat the BJP even if they had to vote for the Congress or any other secular party. The election results do not bear out that they blindly voted for the Janata Dal. In certain constituencies like the Rampur in UP the BJP won because Muslim votes were divided among the Janata Dal, BJP and the Congress(I). In Rampur, Muslim voters were 47 per cent and yet because of this division among three parties the BJP candidate could win. In Domariaganj constituency in UP Mohsina Kidwai, a senior Congress(I) leader, and Seema Mustafa, a BJP candidate were contesting. In this constituency though the Muslims were 35 per cent of the electorate, their votes got divided and the BJP won. In Bahampur too the BJP won because the Muslim votes though considerable, were divided among the BJP, Congress and the Janata Dal.

In Assam, Muslims are 26 per cent of the electorate and they wield considerable political clout. In the last assembly elections they had voted mostly for the Muslim front and it had won 30 seats. However, this time they nearly ignored the Muslim front and voted for the Congress(I) which could win a large number of seats and gained majority. The front got very few seats. In West Bengal the Muslims voted by and large for the left front. Even in those constituencies where the left front was pitted against the Congress(I) Muslim candidates, the Muslims ignored Congress and voted the left front.

In Bihar of course, the Muslims massively voted for the Janata Dal and its allies as a result of which the Congress(I) had to face ignominious defeat. In this state even political greenhorns who contested on the JD ticket won against the senior Congress(I) leaders. In Darbhanga Ali Ashraf Latif, a political novice defeated Nagendra Nath, a senior Congressman with a margin of 1,47,000 votes. In Kishanganj, Syed Shahabuddin won with 80,000 votes defeating M J Akbar, sitting MP of the Congress(I).

All this shows that it is wrong to say that Muslims are a vote bank for a particular party as alleged by the BJP in its election propaganda and this also shows that Muslims do not vote on orders from leaders like the Shahi Imam who trade in

their votes. Also, the massive victory of the BJP in UP shows that the ruling party should not completely identify itself with any minority or any other religious community. The militant advocacy of 'secularism' by Mulayam Singh Yadav only did harm to the cause of secularism and the cause of minorities. It produced strong reaction in the Hindu minds. Of course there are other factors which are no less important for the defeat of the BJP and the Congress(I) but militant advocacy of secularism and using secularism, not as a political philosophy but for partisan ends can become counter productive. Both the BJP and the Congress(I) which supported the Mulayam Singh Yadav government were wiped out in the Lok Sabha elections and got only a limited number of seats in the assembly elections.

Another important lesson to be drawn from this election is that it is extremely dangerous for the unity and integrity of the country to play communal politics as the BJP did. The BJP in this election not only threw caution to the winds, it deliberately, with an intention to capture power, weakened religious tolerance and raised to white heat the communal temperature in the country.

Modern History and Unmodern Minds

G P Deshpande

In Maharashtra today you cannot be critical of Phule or Shahu Maharaj or Ambedkar without being subjected to mob fury. If this continues, it will not be long before we are back to Peshwai consciousness—and we will be doing so not in the name of Brahmin orthodoxy but in the names of the best minds that the non-Brahmin movement has produced in Maharashtra

IN western India there are two beautiful railway stations apart, of course, from the Victoria Terminus of Bombay. One of them is the Pune railway station. One should perhaps say 'was' because the Central Railway has done two rather obscene things to it. All Marathi instructions and boards have been removed and Hindi ones imposed on the unsuspecting people of Pune. The other obscene thing which is even more offensive to the eye is the colour scheme employed in painting the station building. The earlier look of the station was far more satisfying. But fortunately the north Indian dominated Central Railway could do precious little to damage the building itself. The other beautiful little station is that of Kolhapur. The Miraj-Kolhapur railway completed its hundred years this year. The first train from Miraj to Kolhapur left on April 20, 1891. The then governor of Bombay Lord Harris showed the green flag to the train and also travelled on it. Quite contrary to the practice of our democratic republic, the invitation to a special function in Kolhapur three years earlier (to be precise on May 3, 1888) to launch the construction of the railway had specifically stated that all speeches would be in Marathi. Our non-Brahmin bureaucrats (of the Central and the South Central Railway) and, of course, the Hindu nationalists (these days it is not easy to tell the difference, if we go by the exodus of retired civil servants to the BJP) have little use for Indian languages. For them English and Hindi alone matter. Anyway, the reason of this special emphasis on Marathi speeches must have been the doing of Kolhapur's then Raja, a young man in his teens, Shahu Maharaj who, unlike our present rulers, did understand the importance of people's languages. The British understood it no less. In fact at the Miraj railway station you can still see a huge board on which instructions in Marathi were inscribed and the South Central Railway has painted Hindi instructions on top of them! Shahu Maharaj would certainly have protested against this if the

1888 notice is any guide.

This detour via the railways was made essentially to talk about Shahu Maharaj who understood that the railways are an essential pre-requisite of modernity. Hence he launched the Kolhapur State Railway in 1888 and the first train left Miraj on April 20, 1891. This centenary is also related in a way, to Phule's death centenary (1990) and, of course, Ambedkar's birth centenary. Shahu Maharaj like the other two, was a modern man who believed that the Kunbis (peasant castes now generally described as Marathas) should be introduced to 'modernism' if they had to survive the competition with the Brahmins. The role of Shahu Maharaj in the modernising process of the Maharashtrian mind cannot be denied.

There are any number of scholars who recognise the modernism of Shahu Maharaj. There has been valuable work on his contribution to the modernisation of Maharashtra in the late 19th and the early 20th century. Most of it is in Marathi. The present writer does not know if a critical and biographical survey of Shahu Maharaj exists in English. But he would not be surprised if there were none. As usual one may have to wait for some American or English historian's work to generate some interest in the man as far as our modern historical scholarship in this country is concerned.

But that is not the only problem about Shahu Maharaj. In the last couple of decades Maharashtra's modern history has been subjected to increasing deification. Ambedkar has been made into a Bodhisattva. Gandhi was called a Mahatma but both during his lifetime and after he could be and was attacked mercilessly. There are hardly any political activists and intellectuals in Maharashtra today who would be unanointed Gandhians or Tilakites or Ranadeites. A recent book (in Marathi) on Ranade described him as *vrat jant* (the scholar extraordinary) but did not in any way deify him. But that must be one of the last few efforts which

do not turn their subjects into some kind of divinities. Some thing similar is happening to Shahu Maharaj. When personalities are turned into divinities no critique is possible, no critical assessment is possible. It is not recognised that great people have their limitations. But to talk of limitations is blasphemy! To borrow Hanna Arendt's words, said in a different context, the stage when "we are prepared to meet" the personalities "head on, without any preconceived system" has not been reached in our country. We do not seem to notice that there is a difference between being great and being infallible. Because our idolatry does not let us do it, may be.

Anyway, that is what has happened to Shahu Maharaj as the editorial board of the *Maharashtra State Gazetteers* was ruefully to discover. It was the Kolhapur Corporation elections which did it. There is a historical reason for going back to this issue. Bal Thackeray's father was a social reformer, editor of a journal called *Prabodhan* (Enlightenment) and one of the latter day luminaries of the anti-Brahmin movement in Maharashtra. Shahu Maharaj was one of the early leaders of the same. Bal Thackeray's present would make his past quite incredible. But it is not exactly his past. He has merely erected his father's statue near the Portuguese Church in Dadar in Bombay. He obviously has very little to do with his antiquity and ancestry. But Shahu Maharaj was a leader of the anti-Brahmin movement in southern Maharashtra. It is useful to remember that.

Sharad Pawar's government has launched a scheme under which revised versions of the *District Gazetteers* are being published in Marathi. Under that scheme a competent editorial committee made up of leading scholars and academics was appointed to supervise the publication of these volumes. This editorial committee consisted, among others, of the following people: Y. M. Pathan (retired professor of Marathi in Marathwada University and former president of the Marathi Sahitya Sammelan), D. B. Karnik (retired editor of the *Maharashtra Times*), A. P. Zamkhedkar (director of the Maharashtra State Department of Archaeology) and B. L. Bhole (teacher of political science, Nagpur University). K. K. Chowdhary, himself a historian, bureaucrat and secretary to the department, prepared the volume which was referred to the committee mentioned above. R. C. Anvyar was its chairman. This volume runs into 750 pages of which 88 pages (pp. 33 to 121) are devoted to the history of Kolhapur district.

The first edition of the *Kolhapur State Gazetteer* was published in 1886. The second edition, Kolhapur had become a district by now, was published in 1960.

Three decades later the state government decided to publish the third edition. The editor and the committee made every effort to incorporate the new material which has been available since 1960. The author of the *Gazetteer* K K Chowdhary, says in his introduction:

It is sixty-six years since Shahu Maharaj died. Now it is possible to see his contributions to history as also his limitations. This essay is not a biography of Shahu Maharaj. It is an essay in non-partisan history. History by definition involves objectivity, impartiality and a critical view. In our assessment of Shahu we have used three volumes of his correspondence published by the Shahu Maharaj Research Centre of the Kolhapur University, his speeches, the memories of Shahu collected by Prabodhankar Thackeray [Bal Thackeray's father mentioned above] and other recent work. (Translated from Marathi by the present author. Translation tentative.)

It is easy to see that K K Chowdhary has gone about his job quite professionally. There is not a single statement in that account which is not documented. Nor is there any part of the 88 pages which can be accused of not observing the basic rules of historiography. In any case, to attribute any prejudice to K K Chowdhary or the editorial committee is simply ignorance at best or casteism at worst.

Out of the 88 pages devoted to the history of Kolhapur district about half relate to the modern period. Out of that the material on Shahu Maharaj comprises no more than 20 pages. The book dwells at some length on and refutes the charge that Shahu Maharaj was a Brahmin-baiter. There is a rather generous account of what he did for the downtrodden and the backward castes. In fact the account opens with the following words (p 77):

The modern period in the history of Kolhapur begins with the reign of Shahu Maharaj. There can be no doubt about that. Nobody can deny that Shahu Maharaj was one of those great people who were harbingers of the modern age in Maharashtra under the British rule. As Maharsi Shinde pointed out, "Shahu Maharaj constituted one of those natural waves which contact with the west inevitably produced in (the otherwise placid waters of) Maharashtra". He was one of those rare kings who had a passionate concern for the upliftment of the poor and the downtrodden. He was a king and at the same time a fighter in the vanguard of social reform (aimed at the lower castes). (Translation from Marathi by the present author. Translation tentative.)

Why did such an account create a storm then as it indeed did towards the end of the last year? Now that the dust has settled it has become important to take a fresh look at the controversy.

The historical account pays all the tributes to Shahu Maharaj and then goes on to add that Shahu Maharaj was pro-British and that he collaborated with the British in supplying information to the

governor of Bombay about the activities of the extremist-nationalists. The author has cited all the relevant data on the subject, including the correspondence between Shahu Maharaj and the then governor of Bombay. No statement in this book has been made without adequate documentation and neither is this statement. Shahu Maharaj did play a collaborationist role. The book cites this as the limitation of the man and even says that it was inevitable in view of the supremacy of the British power. Shahu would not have remained maharaj (king) of Kolhapur had he refused to play that role.

All hell broke loose in Kolhapur when a couple of Marathi dailies from Kolhapur saw, conveniently on the eve of the corporation elections, in this account a wilful maligning of the revered maharaj. This led to a 'bandh' in the city. The culture minister, Arun Gujarathi, who probably had neither seen nor read the volume, announced the scrapping of the editorial board in the state legislative council and the withdrawal of all copies of the book from circulation. Chief minister Pawar was caught in an impossible situation. Evidently Gujarathi's announcement came as a surprise even to him. He therefore went on to defend his minister and the government in the most unconvincing manner. He even claimed, without any basis of course, that the editorial committee had been given a chance to defend itself. As if this was not enough, the hysterical members of the legislative council wanted a privilege motion moved against B L Bhole who had issued a public statement questioning the propriety of the legislative council and Gujarathi deciding that the editorial committee be scrapped. Fortunately the chairman of the legislative council disallowed that.

The embarrassed chief minister tried to retrace his steps by announcing in the *Maharashtra Times* (the Marathi daily of the *Times of India* group) that "the disputed" paragraph in the historical account of Kolhapur district would be omitted in the re-issue. He further reassured his readers that the editorial committee had not been scrapped. This should in his view close the controversy. It did not quite do that. In a letter to the editor of the same daily, B L Bhole raised the issue that a statement made in the council cannot be gone back on with impunity. It would amount to breach of privilege. Bhole's suggestion clearly amounted to saying that either the chief minister or Gujarathi himself would have to retract the latter's statement in the council. Only then would the controversy be treated as closed.

The Kolhapur railway station which launched the eventful and progressive career of a people's maharaja reminded us of the unseemly controversy. Nobody

wants to correct the initial error of the government. The only fault that can be found with the writing on Shahu Maharaj is one of interpretation. The editors have decided to 'explain' away Shahu Maharaj's collaboration with the British as his limitation. One is not so certain about that. Shahu believed in the 'progressive' role of the British empire. It should be possible now to take a more generous view of his collaboration. Recently Phule had also been attacked for a 'pro-imperialist' stance. The real issue therefore is to define and articulate the attitude towards the empire that some of the social reformers displayed. After all, Shahu did not collaborate with the British to give himself time and leisure to go hunting as many chiefs of princely states were doing during those days. Shahu Maharaj (like Phule perhaps), unaware of the patterns of dominance and exploitation inherent in imperialism, decided, and did so quite consciously, to use it to carve out a place in the sun for the lower castes. In other words, it was a conscious decision. This 'collaboration' was different from that of the princes of Rajputana. The editorial committee fails to make the point. It should have done it.

But to say that is, and would have been, legitimate inasmuch as it would have started an academic debate. Nobody was interested in that. Hence no such questions have been raised about the writing of history in the *Kolhapur Gazetteer*. Not only that nobody has done it, but what is worse is that the entire debate has been conducted in hysterical terms. The chief minister should have made it plain that there was no maligning of Shahu in the writing of the history section of the *Gazetteer*. Such charges amount to approaching modern history with unmodern minds.

This is not an issue on which 'bandhs' are in order. The chief minister cannot and should not treat academic-historians with such contempt. As one Marathi paper put it, populist pen-pushers might well be hired for writing history rather than academics. There is also a bigger issue involved. Is modern history now out of bounds in the land of the Marathas? Tilak was critical of Gokhale all his life but did not lose his sense of history in the process. When Gokhale died, easily the best contemporary assessment of the man was written by *Kesari*, i.e., by Lokamanya Tilak.

There is an erosion of the values of academic integrity in Maharashtra today. Its partially because any number of subjects are being subjected to mob fury. You cannot be critical of Phule or of Shahu Maharaj or of Ambedkar. This is a dangerous situation. We are systematically destroying the 'modern' elements in our life and culture. The controversy, largely

silly and hysterical, on the history of Kolhapur is one example of that. Sharad Pawar, playing his political cards well, has done what almost any chief minister would have done. In that sense it is *not* a question of how the state interferes with the process of writing history. It is a question of the overall climate that we have built in this country in general and in Maharashtra in particular.

The land of Phule and Shahu Maharaj is falling back to medieval times. It is going to require a bigger and wider movement to fight the unmodernity of it all.

One can only hope that some people in Sharad Pawar's conclave are able to see that the project of modernity is jeopardised, almost threatened. If they don't, it would not be very long before we are back to Peshwai (the Peshwa period of Maratha history) consciousness, except that we would do so not in the name of Brahmin orthodoxy but in the names of the best minds that the non-Brahmin movement produced in Maharashtra. In short, we shall be reading our modern history with unmodern minds. The state must intervene to stop that.

ruption present at every stage in the Calcutta Corporation. As per the admission of the West Bengal government (in the assembly) some 5,000 illegal constructions have come up in the last 10 years in Calcutta.

Over 50 per cent. of the residents of Calcutta dwell in the 'bastis'. The housing problem of the middle class and the lower middle class is also worsening by the day. For their survival people are compelled to invest money in illegal constructions. Through its demolition programme the corporation is making tenant slum dwellers homeless. People who have used up the savings of two/three generations to construct a place to live in are becoming penniless because of the programme of demolition of the corporation. When asked by the journalists of some leading newspapers as to why they were going in for illegally constructed houses despite being fully aware of the legal status of those flats they said that it was impossible for them to afford a legally constructed dwelling. Moreover, they believed that these illegal constructions would be legalised in future as a result of political pressure, because at one time the slums were also illegal and had become legal due to political pressure. In the meantime, the corporation has identified some of the 'illegal' structures, but the owners of these houses continue to pay taxes to the corporation. According to the 'basti' dwellers, the houses which are built under the supervision of the owners for their own housing accommodation are illegal but are not dangerous. That is why, they say, the government should not demolish any house without assessing its quality first. Sometimes for safety's sake, if a house is to be demolished then the government should arrange for an alternative and legal arrangement—no one should be made homeless. Implicitly and explicitly, the government was responsible for extensive illegal constructions in the bastis. That is why without arranging for alternative establishment or compensation no house should be demolished. Also the promoters, municipal staff, police, owners should be equally penalised for construction of dangerous houses. When asked why they were not willing to move to other parts of the city specially when they were investing so much money they said that it was the problem peculiar to the minority communities and the people of these communities were always reluctant to become isolated from their own kind.

Some important proposals regarding slum development were discussed during a meeting organised by the voluntary organisation Unnayan following the Collins Lane house collapse on March 7, 1991. The meeting proposed that

CALCUTTA

House Collapses and Police-Builders Nexus

Krishna Roy

Several newly-constructed houses have collapsed in Calcutta recently drawing attention to the nexus among the corporation officials, builders and the police

THREE newly constructed houses have collapsed in the span of two years in Calcutta. Two of these were constructed on 'basti' land and so the victims were largely 'basti' dwellers. It is now quite clear that these incidents are not unrelated nor isolated. Just as people are killed or become invalid after consuming adulterated medicines or adulterated oil, people are buried alive under 'adulterated' houses. And if they escape this fate they are killed or maimed and rendered homeless by the corporation's periodic self-conscious demolitions accompanied by police firings, as happened at Rajabazar.

Needless to say this situation is the outcome of the greed and frenzied profiteering of a particular class of vested interests. Unfortunately the officials of the Calcutta Municipal Corporation who have been delegated the responsibility of keeping a vigil on the activities of this greedy profiteering class have not only completely failed in their duties but are actually explicitly collaborating and colluding in this type of ghastly incident.

The house on Collins Lane which collapsed in February is situated only a stone's throw away from the local corporation office. According to local people the ground floor of the house covered an area of 1 katha (i.e., 720 sq ft). As the other floors went up, the covered area increased. This expansion took place only on one side. Further, the house did not have a proper foundation. The structure of the house had been kept like that of a 'basti' hut and pillars had been constructed on four sides. According to experts, the pillars were also defective and no soil

testing had been done. Out of fear of the local hoodlums and promoters the people had to remain silent—though knowing that the house was on the verge of collapse. While some 15 people were receiving treatment for injuries from the Chandni Welfare Society's relief clinic they had no shelter and nowhere to go when the relief camp closed. How the injured would earn their bread was also a matter of serious concern. The government gave no assurance of compensation, no camp, even of a temporary nature, was organised on behalf of the government for those who were rendered homeless.

The people of the 'basti' said that the government has, out of its political motives, been permitting illegal constructions. The 'basti' land is owned by the government and without its special permission any type of *pukka* construction on the land is illegal. Because of the 1981 amendment of the Thika Tenancy Act 1949, the government became the owner of the land on which the 'bastis' stand and the government and the slum dwellers became the owners of the structure of the 'bastis'. So the Thika tenants were granted the right of changing the structure or developing the 'bastis' but only with the permission of the government. This has given rise to illegal constructions because firstly, it is nearly impossible to make an isolated 'plan' in such a small area of the slum, secondly the long drawn-out, delayed process for obtaining sanction for the plan is exasperating, and thirdly, people always try to find an easy solution and it is easier to take recourse to illegal processes than to clear the hurdles of cor-

(1) 'basti' panchayats be formed of people's representatives for the development of the 'bastis' through which the government will have to work (2) The land price is excessively high in the areas where the bastis are situated. If government rules and regulations in respect of house construction are removed or relaxed in these areas then the promoters will find a 'kingdom' here. Poor people cannot be blamed for being caught in their trap. The building plans in these 'bastis' should be thoroughly studied. An isolated or partial solution would be insufficient. What was needed, the meeting concluded, was a complete and fully organised plan.

The meeting also drew attention to some issues which needed to be resolved. If the large number of illegal houses are demolished then a substantial amount of social resources would be wasted and many unpleasant incidents of death would occur. Administrative lapses and corruption are responsible for this waste of social wealth and human lives and the government alone is responsible for this. The meeting was of the opinion that cases should be filed against the government wherever necessary. The meeting felt when in 1981 the Thika Tenancy Act was amended the government should have taken over the right that the Thika tenants enjoy on the structure, and should have taken over the direct responsibility for formulating a complete and synchronised plan.

RAJABAZAR POLICE FIRING

A fact finding mission on the police firing that took place following a demolition of a house in Gas Street in Rajabazar found the respondents, reluctant to talk and reveal their names. The number of persons killed here was more than was reported by the police. Among the persons killed was an eight year old child who after hearing the sound of the firing went outside to see what was happening. A butcher's son who was carrying coins in a paper bag was suspected of carrying bombs by the police and was killed. Two persons were killed inside a saloon and a cobbler who went to a corporation tap to drink water had his thirst quenched forever. Two mentally deranged persons were injured in the police firing. The relatives of the persons killed were not given the dead bodies which were buried directly under the supervision of the police.

Not only did the police fire indiscriminately, they also carried out in discriminate arrests irrespective of age. Some eyewitnesses said that while arresting they mercilessly beat up people who were helping the injured and later severely tortured them in police custody.

After 14 days the arrested were granted bail on the condition that they would come to the police station whenever required—the beginning of the Ramzan fast being the reason for 'magnanimity' of the police. The owner and the contractor of the illegal house have not yet been traced.

What was the motivation behind this merciless killing by the police? According to reports, after supervising the demolition work, while the police force was going back, some people threw stones or bombs at them. A stone actually struck the assistant commissioner Ayub Khan's car. He instantly ordered the firing and within minutes the police started to fire indiscriminately.

I asked the local people whether they were going to protest against this police firing, specially when the police was persisting in their repressions and have even taken away people's right to protest. They said that they felt the necessity to protest but at the same time were unsure of how to protest. "We used to depend a lot on the 'Red Party' but they have also betrayed us. The so called 'dadas' of the political parties organised processions with the dead bodies of our people only to grab votes. We are ready to fight but who will give leadership?"

Why not try to organise a peace committee or a citizen's forum and peacefully protest? "Yes, we must do something. Promoters will construct illegal houses. 'Mas-

taans' will throw stones or bombs at the police and small children and innocent people will be killed. Who has given the police the right to kill an innocent child or a mental patient? Our hearts are burning. The citizens of Calcutta are getting an impression that Rajabazar has become a den of the criminals and the police have killed the criminals. You go and ask the police whether any of the persons killed have any past record of criminal activities. The incident took place in Gas Street but the murder took place near Science College. This gives an idea about how indiscriminately the police fired."

Local people and some political and human rights organisations have raised some demands: (1) There should be a judicial enquiry regarding the Collins Lane house collapse and the police firing in Rajabazar. (2) Adequate compensations be given to the relatives of the people killed and injured in the incidents. (3) Those officials of the corporation and the police who have taken bribes for the construction of illegal and endangered houses should be traced and severely punished. (4) The residents of the illegal houses should be given prior notice before demolition and those who would become homeless should be adequately rehabilitated. While the Calcutta of the babus is celebrating its tercentenary with garish illumination, band and pipes, poetry and showmanship, the Calcutta of the 'bastis' continues to be forced to dig graves for living people.

INDIAN BANKS ABROAD

V. L. Rao
Senior Fellow

Research and Information System for the Non aligned
and Other Developing Countries
New Delhi

(1991 Rs 150/-) ISBN 81 7021 390 4

The book analyses the working of the Indian banks abroad in comparison with the operations of other international banks. The book suggests how the Indian banks operations abroad could assist in achieving the main objectives set for them—viz earning foreign exchange, expanding India's foreign trade, assisting India's joint ventures abroad and channelising capital and technology into India.

Open Skies over Heathrow

K G Kumar

While the Gulf war may have dealt a body blow to some international airlines, the industry worldwide is now on the upswing, with more flights, fare cuts, better and flashier service and all-round unabashed wooing of passengers in the offing, especially across the Atlantic.

FOR the airline industry worldwide, the Gulf war was a cash-crunching nightmare. That scary period is now past and in Europe and the US air travel shows signs of picking up. But for trans-Atlantic air travel in general and British aviation in particular, the immediate post-war months seem to have blown up gusty winds of change. These have made some airlines gleeful, while one big name, British Airways (BA), is none too happy.

The scene of all this change is London's Heathrow, billed these days as the world's busiest airport for international travel (a far cry from 1983 when the British Guild of Travel Writers voted it the world's worst airport). On March 5, 1991, in logical pursuit of the Tory government's 'open skies' policy of deregulation and liberalisation, the UK department of transport lifted the ban on new 'slots' (landing and take-off times) at Heathrow. Until then only airlines which had been operating at Heathrow before 1977 were allowed to use the airport. This restriction was designed to ease congestion at Heathrow and divert traffic to Gatwick, London's second airport which the British Airport Authority has been promoting vigorously to international airlines and travellers. But that aim was never attained. No airline wished to avoid Heathrow, not just because it is closer to central London but because of its huge passenger volume (over 40 million in 1990) and the greater share of transit traffic.

It was the existence of these unparalleled attractions that prompted two US carriers, United Airlines and American Airlines, to manoeuvre and bargain through the whole of last year to buy up the Heathrow landing rights of their financially-maimed brethren, Pan Am and TWA. That deal finally came through on March 11 when US and UK negotiators agreed to allow United and American to replace Pan Am and TWA in serving Heathrow. The figures themselves speak for the value attached to Heathrow slots: United bought Pan Am's routes for US \$ 290 million, while American coughed up \$ 445 million to grab TWA's Heathrow routes.

To be sure, this deal has brought some gains to British Airlines too. The US will now let a second British carrier—Virgin

Atlantic—fly from Heathrow to North America. British airlines will now also be able to fly to the-US via Europe and then on to Mexico, the Caribbean, South America and the Pacific. They can tie up with domestic US carriers in computer reservation systems. Soon after the deal, Malcolm Rifkind, the UK government's transport secretary, told the British Parliament that British airlines "will get an unprecedented wide range of new opportunities to compete in US markets".

All this will certainly benefit British Airways too, but the UK national carrier is far from happy. Heathrow has always been BA's strong home base and an evidently perturbed management declared that opening up Heathrow would 'materially' affect the corporation's future profitability.

For BA, these developments have come at a particularly bad time. The airline has been struggling to prise itself free from the pincer-grip of the economic recession and the shrinkage of international air travel in the wake of the Gulf war. To fight free, BA's marketing strategies have reinforced the superlative approach: The hard-sell slogan remains "the world's favourite airline", notwithstanding a recent deflating survey by the popular consumer magazine *Holiday Which?* which ranked BA only 22nd in a poll of 48 airlines drawn up by the Consumers' Association. (Incidentally, our own pride, Air India, was outstanding at the very bottom of the list, behind such luminaries like Balkan Bulgarian, Aeroflot and Egyptair.) In a bash-on-regardless spirit, a BA spokesperson was quoted as reacting thus: "We take note of all surveys, but passengers, vote with their feet. Our 'world's favourite airline' claim is based on the fact that we still fly more international passengers than any other airline." Continuing this spiel of superlatives, BA breathlessly launched its 'world's biggest offer' of 50,000 free tickets to London on April 23.

The only one who is truly smiling heartily now is Richard Branson, the flamboyant UK showbiz entrepreneur and founder of Virgin Atlantic Airline. Virgin apes the low-fare tradition of past heroes of budget travellers, viz, Laker Airways and People Express. Already, in anticipation of landing rights at Heathrow, Virgin

Atlantic has announced a cut in its US-London fare by 15 per cent. And soon after BA splashed its freebie offer, Branson took out a cheeky full-page ad in British newspapers. It said: "It has always been Virgin Atlantic's policy to offer you the lowest fares across the Atlantic. Therefore, in accordance with this policy we strongly urge you to fly with BA on April 23. As for the other 364 days of the year you will still find the best fares and the best service on Virgin Atlantic".

Whatever shapes these corporate combats assume, for trans-Atlantic air travellers the opening up of Heathrow can only mean happier days. British department of transport officials are already talking with their American counterparts to win further concessions for British Airlines. Travellers can therefore expect more flights, fare cuts, classier service and all-round unabashed wooing, especially of frequent business fliers.

Eddie Rickenbacker, founding CEO of Eastern Airlines once memorably described the airline industry as "a business of putting bums on seats". In these days of depressed traffic no industry bigwig would dare echo Rickenbacker's brash witticism. Passengers can no longer be treated as captive fools, but for trans-Atlantic travel in the wake of the opening up of Heathrow, there will clearly be more bums chasing cheaper seats.

ON WORLD POPULATION DAY

B.R. PUBLISHING CORPORATION

announces the release of books by
Two Eminent Population Experts

India's Population: Heading Towards a Billion (An Analysis of 1991 Census Provisional Results)/
Mahendra K. Premi (P.B.) Rs. 60

SPEECH DELIVERED BY A. BASU, CHAIRMAN, VST INDUSTRIES LIMITED, AT THE 60TH ANNUAL GENERAL MEETING HELD ON JULY 5TH, 1991 AT HYDERABAD.

It is the first time we are meeting after the Diamond Jubilee of your Company on November 10, 1990, — a milestone in its history. It would therefore be appropriate for me to review the history of your Company before we commence our deliberations on the formal Agenda.

VST — PAST AND PRESENT

It was in 1921 that Janab Mohammed Vazir of Vazir Sultan & Sons, supplicated the seventh Nizam, Mir Osman Ali Khan to use the Charminar as a trade-mark of a new brand of cigarettes he wished to manufacture. This was graciously sanctioned and a 'firman' promulgated to this effect. Several years later, in 1930, a public limited company, The Vazir Sultan Tobacco Co. Ltd. was formed in association with the British American Tobacco Co. Ltd. of the United Kingdom (BAT) with the latter taking up almost two-thirds the share capital. Through a process of dilution and disinvestment over a period of years, the foreign shareholding was reduced to 32% by 1976, and VST emerged as a professionally-managed Indian public limited Company with the benefit of the BAT foreign association in respect of worldwide access to operational know-how, including the fruits of extensive Research & Development activities.

The present factory was inaugurated in 1933 and over the years, investments have been made to expand capacity. However, as a result of a conscious decision, quantum changes in technology have been made in recent years, and today your Company has the largest and most modern factory in India, capable of producing cigarettes of international quality. Its Primary Manufacturing Department is the first to be equipped with Programmable Logic Control. Its Secondary Department, which is in the process of being fully modernised, will soon take into line the latest generation Loga Cigarette Making machine.

Through plantation, landscaping and continued attention to buildings and layout, a conducive environment for work is maintained. A unique odour pollution control system was recently installed and represents another first in the industry in India.

Your Company is in the forefront in respect of its Research and Development activities. A modern, well-equipped laboratory, inaugurated this year and staffed by qualified scientists, keeps a close watch on the quality of the product and assists in the development of new processes and products. Indeed, an application has been filed recently for patenting the indigenous design of certain critical tobacco processing equipment, which has evoked interest overseas.

This consistent thrust towards technology and modernisation has not, however, diluted your Company's care and concern for people, who are central to its business. In our case they consist of 2,472 employees, about 30,000 tobacco farmers and over 500 main dealers, 50,000 wholesalers and 5 lakh retailers who are our customers.

Almost three decades of strike-free industrial relations is the result of your Company's concern for its employees. But behind that has been a history of consultation and participation, including a succession of twelve long-term agreements, commencing from 1952 to the latest one signed in March this year. The Vazir Sultan Tobacco Company Workers Union, Registered No. 1 of 1946, was the first Union to be registered in the erstwhile Hyderabad State, and was formally recognised in 1947 as the employees' sole bargaining agent. The provident fund established in the thirties, the gratuity scheme introduced in the fifties, and a pension from 1982 were Company initiatives — all introduced before they became mandatory by law. Bonus, a source of perennial strife in the Indian industrial scene, has never been one in your Company; instead, a simple and effective productivity bonus scheme which has stood the test of time, has been operative since 1961.

I believe that a culture of adaptability and willingness has now been established, open to new technology, be it machines or computers, be it on the shop floor or in the offices or indeed the rural areas, where tobacco is grown. Your managers are professionals, enjoying an environment where innovation and achievement are recognised, and they provide the leadership to the dedicated workforce today, of whom you can be legitimately proud.

Your Company's association with the tobacco farmers of Telangana commenced in 1952, with the launching of the Tobacco Development Programme. Concepts of scientific farming, linked with bank finance schemes and crop insurance, have helped the farmers in securing a livelihood, in good seasons and bad. Together, we have developed commercially viable varieties of Oriental, Kentucky fire-cured, light soil Burley, a monsoon crop of Sun-cured Natu and other non-traditional tobacco crops for which domestic and export markets are being steadily developed. A major thrust is being made through the 'Trees for Life' programme for providing a balanced diet for the farmers' families, while simultaneously improving the ecology. I believe that another dimension will be added to this relationship

with your Company's contemplated entry into a new agri-business.

It was in 1973 that your Company commenced the distribution and marketing of its products and developed a chain of main dealers, wholesalers and retailers, giving it greater presence outside its traditional base of Andhra Pradesh, and keener insight into the dynamics of the variegated markets in different locations of our vast country. Here again, a symbiotic relationship has been developed with the trade, the value of whose services cannot be underestimated in reaching your Company's products to the consumer, ensuring availability and freshness of stocks.

These sound foundations of a modern plant, trained and motivated workforce, consistent source of raw materials and a sound distribution system, have provided the base for your Company in the market-place, the ultimate arbiter for the progress and prosperity of your Company. The outstanding success has been 'CHARMINAR Special', popularly known as Charminar, first introduced in 1938 and which, through careful nurturing, has preserved its unique place in the world of tobacco. In 1975, sales crossed the one billion mark and it was the leading brand for a number of years. It provided the bulk of your Company's turnover and profits, although there were a number of other brands, such as Gulbarga, Qila, Shah-I-Ikkan, Chandbibi, Kohinoor which provided supportive roles in some selected markets. With the advent of filter cigarettes, your Company entered the market with Charminar Special Filters, Charminar Gold, Vazir and more recently, GOLD Fine Cut.

No historical survey would be complete without reference to one of the most successful consumer product launches in recent years — CHARMS Filter Kings — in the denim pack, evoking the 'Spirit of Freedom', which is indeed the spirit of our times! This market niche determined by careful research, combined with the innovative design, packaging and advertising theme, made it into a bestseller almost overnight, when introduced in 1983. Alas, it fell victim to a change in the Excise duty structure in 1985, but not before it had spawned CHARMS Virginia Filter and CHARMS Mini Kings cigarettes, which today are a significant presence in the growing filter market, their combined volumes exceeding the highest ever achieved by CHARMS. In the export market, CHARMS continues to be the largest selling Indian brand, besides enjoying the distinction of having been totally developed in India.

The 'Spirit of Freedom' lives on, in the prestigious concerts, which are promoted by your Company under that banner. These together with the Charminar Challenge sports sponsorship, enable your Company to fulfil, in some measure, its obligations to society.

It is the resolve of your Directors to continue to build on the foundations laid by their predecessors and I will conclude this retrospective view of your Company, VST

Industries Ltd., as it was renamed in 1984, by reading out the Company credo:

THE CREDO OF VST

"While the Company has consciously initiated a process of modernisation to position VST in the forefront of technology, we have not forgotten our abiding values. The commitment to provide better value to the consumer. The commitment to our shareholders' interests. The commitment to professionalism. The commitment to business ethics. The commitment to create a better future for our employees and the commitment to fulfil our obligations to society. This is the soul of VST, and the Company is committed to preserving these values above all."

A REVIEW OF THE YEAR

Since we met last, the scene in India has been one of gloom and despondency, with the succession of disturbances on the Mandal Commission and Ram Janmabhoomi issues, two changes of Government at the Centre, fresh general elections leading to more violence, culminating in the tragic assassination of Mr. Rajiv Gandhi. The law and order situation in the border states, as indeed in some other areas, has deteriorated even further. The macro economic scene is little better, with revenue expenditure of Government far exceeding its income and the balance of payments, precarious for some years, further aggravated by the unfortunate Gulf War. All of these have had their impact on the operations of your Company as I will detail later on, while reviewing the year's performance.

The process of disinvestment of your Company's holding of 15 lakh shares in Bhadrachalam Paperboards Ltd. was completed leading to a net inflow of Rs. 15.12 crores and capital gains of Rs. 13.62 crores. The proceeds have been invested in Capital Gains Units of Unit Trust of India, assuring that no liability towards capital gains tax arises out of the disinvestment. Excluding these capital gains the operations of your Company have resulted in Profit before Tax of Rs. 18.95 crores and Profit after Tax of Rs. 9.76 crores — the highest ever in its history — and which represent a growth of more than 60% and 65% over the corresponding figures of the previous year.

Several of the measures taken in the past have started bearing fruit. There is an eight-fold increase in exports from Rs. 1.25 crores to Rs. 10.09 crores this year, with all three legs of exports namely cigarettes, tobacco and agri-products showing record growth, and a wider spread of markets. Of

particular significance is the interest shown by overseas buyers in non-traditional varieties of tobaccos developed by your Company. Cigarette exports to the Gulf have revived. I am pleased to inform you that The Federation of Andhra Pradesh Chambers of Commerce & Industry has awarded your Company the Surana Udyog Silver Rolling Trophy for the best export effort in the State for the year and we expect to be recognised as an Export House shortly.

The modernisation of the plant continues with vigour. The latest generation Loga Cigarette Making machine has arrived and will shortly be installed, tried and taken into production. In the market-place, your Company has entered the premium segment with Kingston Dual Filter and the product has been well received.

The financial strength of your Company has been vindicated by the highest possible ratings, FAAA for its Fixed Deposit Schemes and P1+ for Commercial Paper, from CRISIL — the prestigious, independent credit rating agency. The rapid growth of the market value of investment in your Company also reflects its financial soundness and investor confidence.

Taking all these factors into account, your Directors have recommended, subject to your approval, a record dividend of 45% for the year, inclusive of the Jubilee Dividend of 10% and the Interim Dividend of 15% declared earlier, together was a proposal to capitalise free reserves by the issue of bonus shares in the ratio of three new shares for every five shares held. This bonus issue has come after a lapse of only two years since the last such issue. Nevertheless, on the basis of the planned performance this year, it is anticipated that the dividend on the enlarged capital base will be at least 28% barring unforeseen circumstances.

How have such results been achieved in the face of the adversities mentioned earlier? First and foremost, from the dedicated effort of all employees. Secondly, through the consistent practice of participative planning and review about which I had spoken to you last year, and which now has been extended and sophisticated through the implementation of Risk Management. This involves the identification of the key risks that the business faces, a systematic assessment of the probability of each risk occurring and its resultant impact on operations. Every businessman does this exercise in one way or another, but in your Company, Risk Management has been developed through the rigorous application of scientific methods and expanded to cover every department of the factory, leaf operations and marketing.

The value of such a pre-emptive approach is apparent when times are troubled. It enables management to take action to minimise the impact of an event which cannot be prevented. This is all the more important in our business where millions of consumers throughout the length and breadth of the country have to be serviced on a daily basis. For example, Risk Management has enabled your Company to identify intermediate warehousing points and alternative transport routes, generate contingency plans for production during periods of tension and civil disturbances, improve its communication system and to secure against breakdown of infrastructural services.

Nevertheless, it could have been an even happier year for your Company. The conjunction of the Quartercentenary of the city of Hyderabad and the Diamond Jubilee of your Company was a happy augury. A new Company logo was developed, incorporating the Charminar — an eternal symbol of beauty, harmony, strength and stability! As our homage to the symbol which has meant so much to all of us and as an offering to the citizens of Hyderabad on the occasion of the Quartercentenary, your Company has installed sophisticated equipment for flood-lighting the monument. Alas, its inauguration, and several other proposals for civic improvements, discussions on which were initiated with Government, have had to be postponed time and again, bedevilled by disturbances on an unprecedented scale.

The Gulf War had a direct impact on prices of petroleum products and transport, along with the consequent increase in taxation by Government. Curfew affected the factory directly for 6 days during the year, resulting in loss of production, mitigated by the loyalty and commitment of many employees, who volunteered at great personal inconvenience and risk, to keep production going, albeit on a partial basis. While export commitments were honoured in time, the loss of output, together with breakdown of transport facilities, led to occasional stockouts in the market-place, resulting in inconvenience to consumers and loss in excise revenues to Government.

THE ROAD AHEAD

We can but hope that the worst for the country is behind us and that the new Central and State Governments will pursue pragmatic policies to which we can respond with enthusiasm, and thereby use to the full the natural advantages with which our country has been so abundantly blessed. It is not merely a question of deregulating the economy. There is the need for peace and stability, a reinforcement of the basic infrastructure of power and communication, so that we can get on with the job. Work must be encouraged and rewarded, and condonation of non-work eschewed. Policies must be pursued where money has to be earned and not frittered away to fulfil discredited dogma and populist promises.

Your Company is well poised for another satisfactory year, which should see the beginnings of our entry into new lines of business. We have identified certain concrete proposals and, in this connection, discussions with proposed collaborators have taken place. The focus will be on Agri-business, where your Company has already acquired considerable experience, along with exploring other profitable lines of business consistent with national priorities and business needs.

Your Company should be in a position to finalise a specific project by the end of the year.

This does not purport to be a report of the proceedings of the 60th Annual General Meeting

VST INDUSTRIES LTD.

Intellectual Property Rights and Agricultural Development

I sha Menon

The negotiations on Trade Related Intellectual Property Rights, by making it obligatory on the part of member nations to extend the scope of monopoly rights to plants, is forcing agricultural development to take place in a particular direction which will be in the interest of the multinational corporations.

IN the context of the negotiations on Trade Related Intellectual Property Rights (TRIPS) during the Uruguay Round of negotiations of GATT (General Agreement on Tariffs and Trade) and the placing of India in the priority list of Special 301 by USA, the implications of changing the intellectual property regime in India has assumed vital significance. It is often assumed that the impact will be felt mainly on the pharmaceutical sector. But this is not true because there are other sectors such as agriculture where the nature of the intellectual property regime would have very serious consequences.

Studies have shown that it is the sectors where the technology is comparatively easily accessible and where other means of erecting barriers against competition through economies of scale, lead time, learning effect and sales network, etc, do not exist, that the barrier raised through intellectual property rights become important. Pharmaceutical industry forms an excellent example of such a sector where intellectual property rights play a crucial role in determining the performance of the firms.¹ But there are other sectors such as agriculture with significant potential for the application of biotechnology, where similar concerns are valid. Therefore, it is extremely important to take cognisance of the implications of introducing a new IPR regime for agricultural development in India.

Tucked away in the technical language of Article 30 of the draft of the agreement on TRIPS (Trade Related Intellectual Property Rights), a decision is to be taken which would have serious long term impact on agriculture especially in an underdeveloped country like India. This is the decision on extending intellectual property rights to plants. Before we discuss this it will be useful to consider briefly the background to the discussions as well as the nature of intellectual property rights.

GATT is essentially an agreement to regulate the trade in goods. It enjoins the members to grant other members the most favoured nation (MFN) status which in fact means that they will not be discriminated against and that the privileges accorded to one member will be also available to all the

other members. GATT is strictly speaking not the forum for discussing questions of intellectual property for which there are separate forums such as WIPO (World Intellectual Property Organisation). The reason why the US was nevertheless interested in bringing intellectual property into GATT is because by linking it with trade, it gives the US the possibility of taking retaliatory actions, which would not have been possible in other fora.

To begin with, India rightly refused to negotiate on intellectual property in GATT and wanted to discuss only on the issues of pirating and counterfeiting which could be linked to trade. Unfortunately the leadership which India was giving to third world resistance collapsed in 1989. In April that year, the government of Rajiv Gandhi agreed to negotiate on the questions of intellectual property in the TRIPS negotiations of GATT.

INTELLECTUAL PROPERTY

Given the fact that intellectual property is a public good² *par excellence*, it is very difficult to justify the institution of intellectual property rights (IPR) which prevents others from using the information for the duration of the right. Dominant economic theory has always been hard put to justify the inefficiencies which would emerge due to the monopoly rights granted under the IPR regime. Most studies have also been inconclusive about the balance between the costs and benefits to society from the patent system.³

The position of most economists on patents is reflected in the words of Jewkes, Sawers and Stillerman, authors of the classic study on inventions that "it is almost impossible to conceive of any existing social institution so faulty in so many ways. It survives only because there seems to be nothing better. The most wide ranging study on the economic effects of patents conducted under the leadership of Machlup for the US Senate [I Machlup, 1958] concluded that there existed no economic justification for a patent system that it would be wrong to implement such a system if it did not already exist, but that since it did exist it would be equally dif-

ficult to find sufficient data to warrant its abandonment. Apparently the dictum that it is up to those who call for monopolies to justify their position has not been followed in the case of patents.

We have argued elsewhere⁴ [Abrol and Menon, 1990] that the developments in our understanding of the process of technological development have added further arguments against the institution of intellectual property rights. Unfortunately there have been very few studies which have looked at other forms of incentives for investment in innovations or at the option of producing these public goods publicly.

In spite of the absence of any conclusive evidence about the benefits of granting monopoly rights, because of the strength of vested interests, patenting has become common. Patenting, the most familiar form of IPR, until very recently only applied to inventions which were applicable in industry. Earlier even in the western countries, society had prevented this kind of monopolisation of knowledge from extending to important areas such as treatment of diseases and agriculture. But slowly the idea of intellectual property has started being extended to plants also.

IPR ON ILL

If it was absurd to apply the concept of property rights to inventions in industry, it was sheer lunacy to apply the concept to biological materials which are self-reproducing. This emerges from the fundamental characteristics of the systems of intellectual property at least as it formed the basis of patent system.

One of the main objectives of the patent system of granting monopoly rights was to encourage inventors to disclose their inventions and not to maintain them as trade secrets. In the case of IPR for plants, society is being made to pay for something which is anyway available to it since it is self-replicable. Further there is no 'teaching of the technical act' in the case of plants since a person who grows a new variety of plant is not imitating the activity of the breeder. Besides when a person grows the new variety after having paid for it, he or she is carrying out the legitimate activities related to its normal commercial use for which even in industrial patents no permission of the owner of the patent is required. Thus, for example, when you buy an ice cream making machine and use it to make ice cream you are not expected to pay any royalty or take permission and have to get permission only if you produce a machine similar to the one you bought. This principle of 'exhaustion of rights' when the invention has been sold makes the application of patents to plants problematic.

Apart from these legal problems, there were also technical problems which arose

PAYING THE PRICE FOR BEING EFFICIENT

**HOW AN INDUSTRY WITH A PERFORMANCE
THAT MATCHES THE WORLD'S BEST IS CONSIDERED
INEFFICIENT AND FACES A DEATH TRAP.**

From 53% in 1980-81 to 85% (97% excluding sick plants) in 1988-89 for Nitrogenous fertilisers, and 65% to 87% for phosphatic fertilisers. That's the rise in capacity utilisation achieved by the fertiliser industry.

And yet, they call us inefficient.

Now, consider another parameter of efficiency—average energy use per tonne. It's down from 14.6 million Kcal to 11.6 million Kcal (11.3 million Kcal, excluding the two coal-based plants). For gas-based plants, it's only 9 million Kcal while new units along the HBJ pipeline use just 8 million Kcal.

And yet, they call us inefficient.

Simply because the fertiliser subsidy has increased over the years.

But why has the subsidy increased?

Subsidy is related to the level and cost of

production and has increased because production went up three fold. Also because the administered prices of inputs like naphtha, gas, fuel, oil, coal, power and railway freight went up manifold.

And because the farmer still pays the same price for fertilisers that he was paying in 1981, despite substantial increase in cost of production.

Unfortunately, since everything else is beyond its control, the only way the industry can help reduce subsidy is by producing less, which cannot obviously be anybody's intention.

Subsidy has a positive aspect too—increased self-reliance.

It has helped increase

(i) Fertiliser production from 1.8 million tonnes in 1975-76 (before subsidy) to 9 million tonnes now

(ii) Consumption from 2.9 to 12.5 million tonnes.

(iii) Food grain production from 121 to 177 million tonnes

So, to reduce subsidy the industry was made to pay the price in other ways.

Like tightening of norms for depreciation and capacity utilisation. Delays in release of subsidy claims. Inadequate adjustment for escalation claims. Under-recoveries for various expenses incurred. Inequitable adjustment for changes in tax rates.

The result—reduced profitability, threat to viability of new plants, resource difficulties for projects under implementation and bleak prospects for future investment.

In short, a death trap for the industry. With hardly any effect on the overall subsidy bill which rises unabated.

Fertiliser Security. A pre-requisite to food security.

This is the first in a series of three advertisements issued in Public Interest by the Fertiliser Association of India

Mudra D. FAI-0857

from the nature of plant breeding it was considered to be difficult to reproduce plants exactly and it was also difficult to describe them adequately so as to fulfil the requirements of disclosure. Further the question of a new variety being the result of an invention (something which is not obvious to someone skilled in the art) was also not to be met.

Because of the opposition from farmers, etc. and because of the various legal and technical difficulties in applying industrial patents to plants, a special type of property rights adapted for plants was created which was also a milder form of monopoly rights known as Plant Breeders' Rights (PBR).⁵ Unlike in the case of industrial patents, this system allowed farmers to save their seeds for next year's sowing (farmers' exemption) and allowed other breeders to use the protected varieties as starting material for developing new varieties (breeders' exemption).

With the takeover of the seed companies by the multinational corporations and the coming of biotechnology, there is now a demand for a stronger form of monopoly rights in plants, namely, the extension of industrial patents to plants. With the application of patents to plants, the farmers will be not only prevented from saving the seed but breeders will also be prevented from using the variety to develop new varieties for the 20 years for which the right might be granted. Since patents give the possibility of making unlimited number of claims it gives the multinationals the opportunity to claim not only individual varieties but also characteristics and even species and genera. Already patents have been given for plants in the US and Europe in 1985 in the US and 1989 in Europe.

The big multinationals, including those from the pharmaceutical sector such as Sandoz, Ciba Geigy and Pfizer who have taken over the seed companies, want the very strong form of monopoly rights represented by patents. The home countries of these multinationals have been taking stands supporting the MNCs. But they have to also take into consideration the opposition from the other interest groups. In the TRIPS negotiations as well as in WIPO the US has been arguing for the stronger form of monopolies represented by patents to be made applicable to plants and animals. In the European Community the introduction of patents for plant and animal varieties is made difficult by their specific exclusion in the European Patent Convention and by the resistance of farmers' organisations and independent seed companies. Although the European patent office has already granted a patent for a plant it has been challenged in the court. Patents for an animal has not yet been granted. Therefore in the TRIPS negotiations EC cannot be expected to push for the globalisation of patent rights for plants but only for the application of some form of intellectual property which in effect means plant breeders' rights. The current threat

from the US under Special 301 is also an element which adds extra pressure to the TRIPS negotiations and to the globalisation of IPR in plants.

Faced by the demand for increasing the monopoly rights by introducing the system of industrial patents, the plant breeders have responded by increasing the monopoly rights under the system of plant breeders' rights also. These rights were codified in the Convention of UPOV (the International Union for the Protection of New Varieties of Plants) signed in 1961 and to which 20 countries are signatories today. The monopoly rights are to be increased by revising the UPOV Convention. According to the draft proposal submitted for the Diplomatic Conference for the Revision of the UPOV Convention [UPOV, 1990] the two exemptions for farmers and breeders, which distinguished plant breeders' rights from patents and thereby mitigated some of the negative consequences of intellectual property rights in plants are to be effectively removed. Further, the rights of the breeder are being extended from the right to exclude others from propagating, selling and offering for sale the new variety, to the right to exclude others from conditioning for propagation, importing and exporting also.

But the form of plant breeders' rights which existed with the farmers' exemption and breeders' exemption have been replaced with a new form after the latest revision of the UPOV Convention which lays down the

minimum protection to be given to the breeders. Farmers are no more allowed to sell their seeds to other farmers or get them cleaned by outside agencies. The permission of the breeder is required not only for the propagation, sale conditioning for propagation import and export of the breeder's variety but also of any variety which would be termed as being essentially derived from that variety [For more details of the evolution of IPR in plants see Menon, 1991].⁶

INDIAN OPTIONS ON AGRICULTURE

India has so far not recognised any form of intellectual property in plants, and as far as India is concerned, the consequences of the introduction of both these forms of intellectual property are disastrous. At the TRIPS negotiations in Geneva, the developing countries are being faced with the option of continuing with the system which they have today or choosing one of the two systems of intellectual property rights [for more details of these options see Menon, 1990].

Pressure is being put on the Indian government to accept some form of IPR, and former commerce minister Subramaniam Swamy is said to be favouring India accepting some form of intellectual property rights for plants. This means that India will have to accept plant breeders' rights (PBR). There are many others in this country who argue that India should give in on the question of intellectual property so that the coun-

IMPORT MORE PRODUCE LESS!

HOW THE SPECTRE OF FERTILISER SHORTAGES AND BEGGING FOR FOOD WILL HAUNT US ONCE AGAIN.

Remember the sixties and seventies. When we had to go around with a begging bowl for food. We may have to do the same in the nineties, if the fertiliser industry continues to be victimised. Because of a view that imports are cheaper.

A view that is rather myopic.

Are imports really cheaper?

Import prices are determined by two bulk buyers—India and China.

Five years back, India and China produced more fertilisers and imported less. The result—large global surpluses and lower market prices. In fact, the price of Urea in 1986 was only \$87 per tonne f.o.b. which did not even cover the cost of feedstock in exporting countries.

This perhaps, led some to believe that imports are cheap. But the low prices were not related to cost or production efficiency. They were simply determined by the demand-supply balance.

A balance that is no longer in India's favour because of high imports by China and reduced supply from Eastern Europe and Middle East.

The cost of imported urea to the farmer is over Rs.5,000 per tonne. In comparison, the cost of indigenous urea from newly commissioned units along the HBJ pipeline is about Rs 4100/- per tonne despite high gas prices.

Clearly a case for producing rather than importing more. A case further strengthened by a look at the future

The future is even bleaker

By 1994-95, India's domestic production will trail projected demand by 20% for nitrogenous and 38% for phosphatic fertilisers. The result increasing dependence on imports, when global availability will be scarce and prices beyond our reach. Moreover, where will the foreign exchange come from?

Fortunately, there's a silver lining. We have the natural resources, particularly gas, and ability to produce more.

Unfortunately, not many see it that way. And are in favour of imports. An attitude which may finally result in fertiliser shortages

And send us begging for food all over again.

Fertiliser Security. A pre-requisite to food security.

This is the second in a series of three advertisements issued in Public Interest by The Fertiliser Association of India.

Mudra D. FAI 0857-2

try might get some advantages on the question of export of textiles. But the question is, is the future of Indian agriculture so unimportant that it can be compromised for getting 'some' advantages in textile exports?

If the government gives in to the pressure from the multinational corporations and the developed countries and accepts the plant breeders' rights system, the consequences would be very negative for agriculture.

Before we consider the impact on agriculture, it is useful to see who needs intellectual property rights in plants and why they need it. The main proponents of the introduction of intellectual property rights in India have been multinationals like Hindustan Lever [Sinha, P M 1990]. Since 1984, after the addition of seeds to Appendix I industries, FERA companies (companies having 40 per cent or more foreign equity) have been moving into the seed sector.

These multinationals would like to have complete control over the seed production so that they can gain even more from this lucrative business. Multinationals usually do not operate in a sector in which there is competition and they tend not to compete with each other. They operate in markets with at least some degree of monopoly so that they can gain super profits. The extent of domination which can be achieved is much more in the case of industries where segmentation of the market is easier. In such situations although it might appear that there are many producers and considerable amount of competition, the reality would be quite different. Thus, for example, in the case of the pharmaceutical sector where the products are disease specific it has been observed that multinationals dominate these individual markets [Satwinder Singh 1985 pp 71-94]. Given a similar product specificity, in the case of seeds also similar possibilities of domination and extraction of super profits exist. This is illustrated by the understanding reached between the European seed company Van der Have and the US firm Pioneer Hybrid in the market for maize seed. Since 1976 there has been a division of labour between these two companies among others in the French market. In the European market Pioneer has been concentrating on grain maize while Van der Have has been focusing on fodder maize [Groosman and Meerendonk, 1983, p 53]. In this struggle to gain super profits, plant breeders' rights are important in two ways.

To begin with, it helps the seed companies who have succeeded in developing a new and important variety to create an artificial monopoly since it will take a much longer time, say about 10 years, before a competitor can come up with an alternate variety with similar qualities. This artificial monopoly will help them to get higher prices than would be possible with free competition.

Secondly, it also helps them in their strategy of non price competition. The seed companies spend a considerable amount of money on advertisements, usually many

times that spent on research. According to the new system of PBR, no one else can produce varieties which are essentially derived from the new variety. A variety is considered to be predominantly derived from another variety when the method used conserves the essential characteristics of the genotype of the initial variety, such as in the case of the selection of a natural or induced mutant or of a somaclonal variant, backcrossings or transformation by genetic engineering [UPOV, 1990, Article 14 (2)]. In this manner the breeders' exemption has been severely curtailed and much stronger monopoly powers granted under the PBR regime. Therefore the seed company will be able to go on advertising these derived varieties as 'new and improved varieties' and keep asking for higher prices which cannot be challenged by anyone else. In this manner, the companies will be able to extend the life of the variety when it earns super profits.

In other words, in combination with the marketing strategy plant breeders' rights become another instrument for increasing super profits. The system of PBR is a powerful tool in the hands of the multinationals to increase their incomes and profits. The TRIPS negotiations are aimed at perfecting this tool.

We shall consider the impact of PBR on the supply of seeds in the country and its impact on the incomes of farmers. The impact on the absorption of technology would have grave consequences for the long term prospects of agriculture. We also look at the implications for agriculture since it has been used as one of the main arguments for bringing in these measures.

SUPPLY OF SEEDS

One of the major problems which we face in our country today is the inadequate supply of good quality seeds. Due to the weakness of the delivery system, many of the new and useful varieties which have been developed are not available to the farmers. The public agencies for production and distribution of seeds have not been able to fulfil the need. Although many small seed companies have come up, they are plagued by unscientific methods of production etc.

What is required is the presence of large numbers of seed producers who have to get adequate scientific state support to multiply the seeds required by the farmers. The producers can be seed companies, farmers co-operatives and individual farmers. These can be complemented by seed production in large organisations.

With adequate knowledge and demand by the farmers, such an alternate system of seed production can be set up which can make available to the farmers many new varieties of seeds which are developed in our national laboratories.

Today the public sector in India develops new varieties just as it did in the US and other Western countries till some time ago. Under the present system, the small seed companies are able to multiply these seeds.

They are also free to multiply the seed developed by any other private company. The farmers who buy the seed are also able to multiply the seed and also sell it to their neighbours. Therefore, the potential for a thriving seed industry exists.

But instead of using this potential for setting up a healthy and widespread seed industry, the development is now in danger of going in a totally different direction. Multinational corporations are moving in to the empty space left in the seed supply.

It has been observed elsewhere that when these big companies move into seed production and start their own breeding, public sector breeding is made to support the breeding activities of these seed companies.⁷ The public sector is made to do basic research which is then exploited by these companies. Ultimately, the small companies are left at the mercy of the big companies to whom they have to pay royalties whether they multiply the seed or only clear and process it.⁸ The same will be also applicable to the farmers who undertake seed production. In such a situation many of the smaller seed companies usually go broke. The destruction of these companies will have a big impact on the supply of seeds.

The increase in monopoly due to the introduction of a system of PBR will have very negative consequences for the income of farmers. The monopoly control of the multinational companies will function in different ways as we have already mentioned. Apart from what we have already stated the new form of plant breeders' right which is being introduced will add another way of increasing monopoly.

Under the earlier system of PBR a seed company could only prevent others from multiplying the same variety as what it has developed, but it could not prevent the other companies from developing new varieties based on the original variety. In case selections could be made from the marketed variety, then it was possible to come on the market with a comparable variety quite quickly. This reduced the extent of monopoly the first company had. But under the new system of PBR, it will not be possible for other seed producers to develop varieties similar to the monopoly varieties. Therefore the seed company will be able to charge very high prices for the new variety and the farmer will have no choice but to pay it.

For example, let us assume that there is an epidemic of blast disease and some company succeeds in transferring the gene for blast resistance to rice. Under the new system, no other company will be able to produce any modification of that rice. Producing a new variety with resistance by crossing with other varieties will take time and effectively this means total monopoly for the first breeder, a monopoly much higher than what has existed so far even in the US.

This in effect means that because of the legal monopoly of plant breeders' rights, the farmers will be paying a higher price than what would have been otherwise the case.

An illustration at the top of the page shows a heavy metal chain. One end of the chain is attached to a large, dark, spherical bomb with a visible fuse. The other end of the chain is broken and falling away from the bomb. The bomb is positioned on the right side of the page, and the broken chain links are scattered in the air around the main title.

UNTIE OR ELSE

HOW THE WEIGHT OF DISTORTED PERCEPTIONS ABOUT SUBSIDY COULD JEOPARDISE A RS.10,000 CRORE INDUSTRY AND FOOD SECURITY.

The results could be catastrophic. Shortage of fertilisers. No foreign exchange for imports. And ultimately shortage of food.

Unfortunately not many seem to realise it. And clamour for reduction in subsidy per se.

To set the record straight, the fertiliser industry too has no vested interest in the continuation of subsidy. But for the industry to survive and grow in the face of subsidy reduction, certain measures must be taken.

Recognise the ground realities

The present pricing system has helped the industry grow and become more efficient. And the increase in subsidy is on account of factors like high input costs, low consumer price and unnecessary taxes and duties—all controlled by the Government.

Did the authors of the system envisage this scenario? No. In the face of low consumer price some subsidy was unavoidable to attract

investment. However, it was never intended that selling price will remain unchanged in spite of Government itself raising the prices of inputs and levying various taxes and duties. But precisely this has happened.

So the fault is not with the system. But with the way the producer and consumer prices have fallen apart. Hence to reduce subsidy, the gap between these two should be narrowed. Input prices should be frozen. Unnecessary taxes and duties removed. And consumer price should be raised.

Alternatively the answer could be a gradual move towards de-control.

The key word being gradual, as otherwise the market price will immediately rise to a level which farmers can't afford. Moreover, it will not be adequate to cover reasonable cost of production of a number of units.

So the consumer price can be raised gradually,

over a period of 5 years. Incidentally, a 10% increase in fertiliser prices will cost Rs 600 crores in subsidy and increase cost of food grains by 10 to 15 paise per kg.

Small and marginal farmers will have to be protected through separate package. Consequently, when de-control is introduced at the end of 5 years, the farmer will be prepared to pay the price at which the industry also has a fair chance of surviving.

But for this to succeed, input prices which are already high, should be frozen at existing levels, no further increase in taxes and duties and finally various controls on fertilisers should go.

The time to take stock is now. Or else it may be too late.

Fertiliser Security A pre-requisite to food security.

This is the last in a series of three advertisements issued in Public Interest by The Fertiliser Association of India.

M. G. L. FAL 0957

In other words this policy means that there will be a transfer of income from the farmers to the big seed companies. The farmers are forced to pay this subsidy because they have no choice. Further, this subsidy of the seed companies by the farmers is actually a subsidy of the rich by the poor.

It is not only the immediate interest of the farmers that are affected by plant breeders' rights, but also the long-term goal of the nation of obtaining the fruits of modern technology, particularly the fruits of biotechnology. It is not only the high costs of the technology which is at stake but the very availability of the technology itself.

A technology does not become available, just because some company imports a seed containing the technology or even if it multiplies the seeds in the country. We can say that the technology is available only when the technology can be suitably modified to suit Indian conditions. The conditions under which the technology is being introduced, namely, under the control of multinational corporations will prevent this work from being done. For the multinational corporations, even a comparatively big market like India is actually only a test market and the global research strategy of these corporations is determined by the markets in the developed countries. They would be satisfied with markets that can be obtained by catering to the needs of the comparatively better endowed areas and farmers and neglect the rest of the country. They are not likely to undertake the arduous task of modifying it for further adoption. Since the new variety is also the property of the multinational, no one else can also take up adaptive work.

This in fact means that the 'modern technology' would not be available to the majority of the farmers. This impediment to the absorption of technology would be made even more difficult since there will be a lot of pressure on the government not to take up the development of finished varieties and concentrate on basic research.

This is a fact which distinguishes the current agricultural developments from the one which took place during the green revolution. During the green revolution the key technological input, namely, the new fertiliser responsive dwarf varieties of seeds were in the public domain. The dwarf varieties which initiated the green revolution were developed in the international agricultural institutions and belonged to all the people. Whatever might be the distortions introduced through the green revolution this was a positive aspect of the green revolution. In contrast, in the current application of biotechnology, the breakthrough is not likely to be the property of public institutions but of the multinationals. Therefore, in the new regime, the extent of absorption would be that much reduced.

The legitimisation of intellectual property rights through the GATT would thus further buttress the position of these multinational corporations, and make the absorption of technology that much more difficult.

EXPORT OF AGRICULTURAL PRODUCTS

One of the main arguments for allowing the introduction of plant breeders' rights is the prospect of agricultural exports. This point was concretely raised in the context of the new seed import policy⁹ when the import of seeds and the introduction of intellectual property rights were argued as necessary for gaining export markets. All the same we would argue that the introduction of plant breeders' rights will actually reduce our prospects of gaining from the export market. This is linked to the nature of the system set up to undertake exports.

Multinationals require plant breeders' rights because of the kind of exports they undertake. They use the developing countries to multiply the seeds which they have developed. These raw seeds are then often exported to their base countries and then re-exported to other countries. Therefore, quite a lot of the value addition takes place in the developed countries and the developing country is merely used for its cheap labour and advantageous climatic conditions.

This is shown quite clearly by the pioneering study about the Dutch seed industry by Groosman and van den Meerendonk [1983]. In 1980 the price per kilo of the imported seeds varied between 24 per cent to 76 per cent of the value of the (re)exported seeds [Groosman and van der Meerendonk 1983: 34]. The international division of labour followed in the production of bean seed by the second biggest Dutch horticultural seed company, Royal Sluis, is quite instructive.

The breeder seeds are produced in the Netherlands. The first multiplication of these seeds take place at the daughter company in Idaho, USA. Later, the seeds are again multiplied in Tanzania. Since labour is cheaper in Tanzania the harvesting can be done more manually thus avoiding damage of the seeds [op cit 88-89]. Although the acreage under bean seed in the Netherlands has been steadily declining from 1,110 hectares in 1970 to 660 hectares in 1980, the exports of bean seed has been steadily going up from 5,899 tonnes in 1970 to 9,411 tonnes in 1980, and then to 11,485 tonnes in 1982. In 1980, 12,201 tonnes of bean seed was imported to the Netherlands with almost three-fourths of it being from Tanzania [op cit 28-29 and 107]. The same year, as we have just seen, 9,411 tonnes of bean seed was exported from the Netherlands. The price per kilo of the imported seed was only 49 per cent of the re-exported seed [op cit 34]. Here we see clearly the operation of a system in which Tanzania, the producing country, receives only a minimal share of the gains from exports due to the domination of the foreign company.

In such a system of exports, it is important for the MNC that it can claim monopoly rights by the legal system of PBR. Otherwise the farmers who are multiplying the seeds will be in a position to export the seeds directly.

In the earlier system of PBR, a breeder could not prevent the imports of the protected variety from another country where

It might get multiplied. After the new revision the permission of the breeder is necessary not only for multiplication and sale but also for exports and imports. Because of the changes in the system it will not be possible either to export seeds of the modified version of the variety. Thus with the current revision the possibilities in the earlier system of IPR by which sub-contractors could turn into competitors have been removed. Thus the legal system has been also modified so that multinationals can continue to maintain their control over their global network of production.

The question is whether this kind of exports based on subcontracting is what needs to be developed. It might appear to be an easy way to earn foreign exchange in the short run. But this type of subcontracting limits the gains which can be made by the export of seeds. It is a different question if it is used as a stepping stone for independent seed exports.

Some people are afraid that if India does not accept some form of intellectual property it will not be possible to obtain the new varieties developed in the developed countries. The fact is that many firms have been able to obtain new varieties without having PBR. Further a healthy export trade in seed should not and cannot be based on subcontracting to MNCs. It can only be based on a system of integrated seed production which includes breeding, multiplication and processing. Such an export industry should be based on technological capabilities and agro climatic conditions rather than on legally enforced monopolies. In fact rather than developing a rational system of international trade, these legal monopolies will only distort the international trade apart from reducing our gains from agriculture.

The negotiations on Trade Related Intellectual Property Rights by making it obligatory on the part of member nations to extend the scope of monopoly rights to plants, is forcing agricultural development to take place in a particular direction which will be in the interest of the multinational corporations. At the same time the imposition of property rights in plants even if it is only PBR will affect negatively the growth in the supply of seeds, the income of farmers, the absorption of technology and the prospects for export incomes.

Notes

- 1 A recent survey of 18 most R and D intensive US industries by Levin and his colleagues [1984] indicates that product patents were regarded as more effective than other means of appropriation only in the drug industry. The survey results indicate that in general patents were viewed by R and D executives as an effective instrument for protecting the competitive advantages of new technology in most chemical industries including the drug industry, but patents were judged to be relatively ineffective in most other industries.
- 2 A public good has the attribute that each individual's consumption of such a good

leads to no subtraction from any other individual's consumption of that good" [Samuelson 1954, quoted in Besen, Stanley M 1987]

- 3 See Scherer, F M [1980], for a good review of the studies.
- 4 We have argued that many of the more recent studies are forced to recognise the interlinked nature of innovation thereby undermining the arguments for patent monopolies. Spill-over effect, that is, the fraction of the R and D of a firm used by another is shown to have a positive effect on technological performance undermining the arguments for monopolies. By preventing standardisation and the growth of complementary products, intellectual property rights are shown to inhibit the utilisation of network externalities.
- 5 This is also true of the US Plant Patent Act of 1930, which in spite of its name resembles PBR more than ordinary industrial patents.
- 6 According to the latest information available the Convention for revision held in Geneva between March 4-19, 1991 has agreed to severely restrict farmers exemption and that the adopted text differs from the draft text only marginally. See UPOV Revises Convention [1991].
- 7 The United States government announced in 1982 that it would end a century of varietal release work and confine the work to basic research. Similar developments have taken place in other countries such as the Netherlands, West Germany, Sweden etc. [Information Notes 1983].
- 8 Berlan and Lewontin discuss about the impact the plant breeders' rights and the consequent payment of royalties have had on the small (non breeder) seed industries in Britain and France. See Berlan and Lewontin [1986] p 786.
- 9 For more details of the New Seed Import Policy see Menon and Sadananda [1989].

PEOPLE-THE DECISIVE DIFFERENCE

**SPEECH OF THE CHAIRMAN, SHRI K L CHUGH
AT THE FIFTEENTH ANNUAL GENERAL MEETING
OF THE COMPANY ON 3rd JULY, 1991, AT HYDERABAD**

Changes in the policy framework would encourage the industry to become a capable world player and a significant foreign exchange earner and as I have often said a major employer in the Rural Sector

I am pleased to welcome 2 667 new Shareholders who have become Members of the Company during the last year raising the total number of Shareholders to 14 724

Last year's results are a continuing tribute to the unrelenting efforts of your Company Employees and I take this opportunity to express on your behalf and on behalf of the Board of Directors our appreciation of their efforts. Despite adversities in terms of floods and some temporary personnel issues profit after tax increased by 91% to Rs. 15 47 crores with earnings per share improving to Rs. 14 64 from Rs. 7 67. Capacity utilisation during the normal working period, at 138% was an all-time high. Considering the good performance of your Company your Board has recommended an increased dividend of 37 5% compared to 32 5% in the previous year. Investors confidence in your Company is reflected in the high price of your Company's share which has for the first time crossed the price level of Rs. 150/

Coupled with the above facts is the reality that your Company has brought progress opportunities and new light and life to a backward area. These ventures must give you cause for satisfaction as owners. It makes you investors in progress and enriches the quality of the returns which you earn on your investment.

You will recall that last year I had shared with you that your Company was embarking on a market expansion strategy to ensure profit growth and survival. This meant that whilst we would retain our position in traditional strongholds we would be entering the high-value premium segment of the market. I am pleased to communicate that in furtherance of its competitive strategy your Company has successfully developed through Research and Development high value products both for the domestic and the international markets. You are aware that your Company has been pro-active and has made timely investments in the last few years the benefits of which we are now reaping. To further fortify our position in the industry, we will continue to make substantial investments in modernisation, quality upgradation, balancing equipment, and capacity expansion. All this would require substantial liquidity. In this perspective your Board has transferred Rs. 11 51 crores to General Reserve this year raising the total General Reserve to Rs. 36 crores.

Amongst the most important sources of competitive advantage is superior energy management. The commissioning of the Atmospheric Fluidised Bed Combustion Boiler with a turbo-generator of matching capacity completes the total energy project which shields your Corporation from the vagaries of external power supply and arms the Organisation with further competitive edge.

To enable the industry play its role, both in the national and international perspective Government Policy must encourage investments not only for modernisation of existing capacities but also for establishing fresh capacities. Towards this, the import of critical capital equipment will need to be encouraged at rates of import duty much lower than the prevailing 65%.

Sharing the national concern on the Balance of Payments position YOUR COMPANY THROUGH AN AGGRESSIVE AND VIGOROUS EXPORT EFFORT HAS EMERGED AS THE LARGEST EXPORTER OF PAPER IN INDIA. Our export earnings have increased by 80% compared to the previous year, to over US \$ 3 5 million. The success of our export effort is a corollary of the fact that the Indian Paper Industry is capable of capturing market niches in the full face of international competition. The present prognosis is that the industry has to gear itself to satisfy a demand of 52 lakh tons by the year 2000. However in the perspective of the success of our international efforts we may indeed have set our sights too low. Changes in the policy framework would encourage the industry to become a capable world player and a significant foreign exchange earner and as I have often said a major employer in the Rural Sector.

We cannot of course predicate the industry growth at the cost of the environment or pulp-wood supply from the natural forests. Pulp-wood has to be grown in Captive Plantations and Economy of Scale in mill sizes will have to be built in with technology that is contemporary to become competitive and give the consumer quality products at prices that are internationally competitive. Presently the industry is dependent on large imports of raw materials, both pulp and waste paper consequent to the ban on supply of pulp wood from natural forests. As a measure of conservation the Government had placed import of raw materials under open general licence and had also exempted it fully from customs duty. It is unfortunate that customs duty of 40% on waste paper and 10% on pulp has since been imposed making domestic production very expensive. This is likely to become counter productive and would stifle the domestic industry. The eventual outflow of foreign exchange to import the finished product to bridge the supply/demand mismatch will be higher than the outflow of foreign exchange to import raw materials for use by the industry in India.

Paper Industry has always been capital intensive. The last few years have however witnessed the capital intensity escalate very rapidly from Rs. 10 000 per annual installed ton in 1979 when your Company's mill was established to approximately Rs. 40 000 per annual installed ton today. At this cost the setting up of a mill of Bhadrachalam's size

Perhaps the single greatest upheaval in the traditional paradigms of business is in the area of Information Systems and Organisation Design. Since Information Systems have increased the span of managerial jobs it tends to flatten the organisation structure and releases whole layers of people from routine communication coordination and control jobs. The conventional pyramidal organisation is gradually transforming into an organisation of clusters and networks of people who form dissolve and re-form to resolve issues in a turbulent and dynamic environment.

would involve an outlay of over Rs. 300 crores. To enable the industry play its role both in the national and international perspective Government Policy must encourage investments not only for modernisation of existing capacities but also for establishing fresh capacities. Towards this the import of critical capital equipment will need to be encouraged at rates of import duty much lower than the prevailing 65%.

In the National Policy Framework therefore, if the Government -

- (1) facilitated the industry's investments in scientifically managed plantations,
- (2) allowed the import of critical capital equipment at rates of import duty that are much lower than prevalent today enabling the Indian Engineering Industry to add further value and
- (3) in the short term reduced the customs duty on the import of pulp and waste paper the industry would be able to make meaningful strides towards progress and become a source of strength and prosperity to the national economy. Attention of Government, therefore, must focus on these issues which are, in fact, opportunities for Government and Business to affirm their partnership in the Nation's development.

The fundamental task of your Management is to ensure the prosperity of your Company in perpetuity. Continued environmental scanning reveals opportunities in the Financial Services Industry. These opportunities are matched by complementary skills within your Organisation. Diversification into this industry would create new income-streams which will further strengthen your Company. It is considered advisable therefore to enter this business on a long term basis through a wholly owned subsidiary. The investment in this company to start with will not exceed a sum of Rs. 5 crores with your Company having the controlling interest. To infuse strength into this diversification proposal it is necessary to integrate certain intangible assets which rightly belong to your organisation. As members you are aware that Bhadrachalam Paperboards Limited was promoted by ITC Limited. In its embryonic years ITC Limited nurtured Bhadrachalam through its trials and tribulations. Since Bhadrachalam Paperboards Limited is an integral part of the ITC Group it is proposed to change the name of your Company to ITC Bhadrachalam Paperboards Limited. The intangible assets of two strong and vibrant names ITC and Bhadrachalam will not only further strengthen of your Company but will also infuse a competitive strength to our new proposed Financial Services Organisation. I look forward to your support for these proposals.

PEOPLE-THE DECISIVE DIFFERENCE

I now come to today's theme which is dedicated to the people who make things happen. THEY MAKE THE DECISIVE DIFFERENCE. Human Resource is the prime mover of advancement and development. The strides that companies and indeed countries make is founded on the ability of leadership to tap the productive genius of a people. However to develop people appropriately it is necessary to comprehend the emerging scenario and the environment in which they will have to perform.

THE CHANGING BUSINESS ENVIRONMENT

Ours is a protected economy and this has impeded accelerated accretion to national wealth. Undue protectionism has created a high-cost low quality economy. Resultantly

in a globalising world our competitiveness is poor. The reality is reflected in our Balance of Payments and Internal Debt position which has reached crisis proportions.

Whilst we ponder over our own realities, a new world economic order is rapidly taking shape. Philosophies and dogmas which held sway for over a century have been dismantled in less than one year. Throughout Eastern Europe the cry is to shift from a command to a market economy. The business-geography of the world is changing with the emergence of economic communities ushering in a new kind of citizenship and creating new compulsions, opportunities and challenges for countries and companies throughout the world. These developments will inevitably affect the way Nations and Corporations strategise to ensure their growth and survival and prove their good corporate citizenship.

The work-force and personnel of the future will contain numerous specialisms which need to interact synergistically. Business leaders must encourage and create the circumstance for team building and productive collaboration between Specialist and General Managers to achieve business results.

To meet the challenge posed by these rapid changes, it may be necessary to question the fundamental precepts of the model followed by us till now, which places capital at the centre of the developmental process. I believe that Capital should now be replaced by People who should occupy the centre stage. Of the seven basic resources of the manager (Men, Machines, Materials, Money, Time, Land and Ideas), it is the human resource that creates value and achieves the productivity necessary for success. What then must be the framework for human resource strategies? What will equip the People of Tomorrow to manage the market products and technologies in the emerging world economic order? Answers to these questions is a Top Management responsibility. Today's Top Management must prepare its people to face the challenges ahead and thus perpetuate the Organisations they govern.

CREATING AN INTERNATIONAL PERSPECTIVE

To create the market-driven companies of the future, we will have to develop an international perspective in our employees to facilitate the required change. Traditionally, our people have confined their perspectives to within National boundaries. The changing demands make this perspective obsolete.

In the sphere of Marketing, as the future unfolds, perceptions of the customer are changing from a Mass Market in the 50s and 60s to a Segmented Market in the late 70s and 80s, and now into a matrix of niches with a very demanding product and service satisfaction criteria. To succeed in a stochastic marketing scenario, we will have to underscore the basic maxim of marketing: that the customer must come first. We must affirm that marketing expenditures are in fact investments in creating competitively superior products and services. Marketing processes must not be limited to the marketing function but should include the entire organisation and strategy must integrate the various structures and functions of an organisation to deliver satisfaction to the customer on an on-going basis. Cross-cultural and international marketing will require the induction of skills and the infusion of marketing knowledge through training programmes within the Company.

Technology ingestion will have a significant impact on almost every aspect of business. The technologies of yesteryears which were based on conventional electrical, mechanical and chemical engineering, are now being overtaken by new knowledge in microelectronics, semiconductor, genetic engineering and robotics. Strategic alliances will have to be forged to facilitate skills and knowledge transfers to create globally competitive concerns. These new alliances, knowledge and technologies create opportunities for learning and training a new breed of people. The ingestion of this new learning will create new opportunities for human resources development in a multinational context.

Perhaps the single greatest upheaval in the traditional paradigms of business is in the area of Information Systems and Organisation Design. Powerful new software in On Line Expert and Executive Information Systems have been developed. These in tandem with hardware breakthroughs in Cellular Radio Technology, Optical Storage Media and Neural Networks have made Information Technology increasingly people friendly. The most significant area of the effects of this Technology on the modern organisation is in the sphere of Organisation Design. Since Information Systems have increased the span of managerial jobs, it tends to flatten the organisation structure and releases whole layers of people from routine communication, coordination and control jobs. These resources can be retrained and redeployed.

Leadership must encourage risk-taking and innovations to face the changing challenges that organisations have to deal with in the emerging world economic order. Leaders must allow for occasional failure as a process of learning.

The conventional pyramidal organisation is gradually transforming into an organisation of clusters and networks of people who form, dissolve and re-form to resolve issues in a turbulent and dynamic environment. In the flattened organisation structure of future companies, compensation packages will not necessarily follow the logic of level in a pyramid. Infusing knowledge into and empowering the work force will create the commitment necessary for competitive success and will prevent undesirable absenteeism and turnover.

In no other area has the future arrived faster in our global village than in Financial Management. In this area, information is directly linked to competitiveness in the trade of financial instruments. These developments in Financial Management will facilitate increased investment opportunities and the emergence of tailor-made products for specifically defined customer segments. Expertise in currency management and funds deployment will have to be created. The role of the controller will now progress from Financial Accounting and Management Accounting to a new form of Strategic Business Accounting.

A BLUEPRINT FOR THE HUMAN RESOURCE

Traditionally, the accounting treatment of people classifies them as costs rather than investments. How often have we heard that People are our greatest asset? The tragedy

is that this is becoming a cliché. Actions have belied words, and the wrong kind of compromises have been made which have affected the credibility of leadership. In India, over protection and lack of competition in the economy has created a situation leading to a continuous outflow of human talent which aspires for meaning in their work as well as improved monetary rewards. It has given us the luxury of accepting mediocrity. Managerial practice has often used talent but rewarded mediocrity for their own comfort. This style of management is a complete anathema to the internationally competitive organisation we want to create and establish.

In formulating our blueprint, we must begin with the creation of an Organisational Philosophy. This Philosophy must have the active commitment of people. It must not be so esoteric that it is difficult to comprehend throughout the company. Most importantly, it must be seen to be practised. In fact, it is better not to have an organisational philosophy at all, rather than to have one which is denied every day in our work practices. This affects morale adversely and breeds cynicism in the Organisation. In Bhadrachalam, we knew that our people could share a common vision only if that sharing was rooted in a common culture. Over the years, our organisation's philosophy based on knowledge, candour, understanding, commitment, hard work and mutual respect has created a vibrant culture which has enabled your Organisation to achieve pinnacles of productivity. To paraphrase a verse in the Rig Veda: there is union amongst us because of the common wishes of our hearts.

Based on our philosophy and culture, people policies and practices in Bhadrachalam have been formulated. We have tried to foment a sense of fraternity, togetherness and belonging. We have emphasised the pre-eminence of the team and have underscored the reality that the output of hard working teams is greater than the sum of the individual inputs of the persons who comprise the team. We have given competitive monetary rewards, have ensured hygienic work and living space and have created the availability of the basic amenities for health and education. In short, we have designed and delivered an anxiety-free environment conducive to learning, performance, productivity and progress. These actions have been fundamental to the success of your Company which was facing the challenge of creating a successful enterprise and a new culture in a backward area and in a very competitive industry. As a measure of our commitment to learning, your Company is establishing a Research Centre which will pursue research and harness actionable knowledge relevant to business management practices in India.

As we take ourselves forward to grow and carve a niche in international markets, we can take sustenance from our past investments. If learning has become an organisational habit, we can face the future of discontinuous change with confidence.

To make work productive and people achieving, we have to effect the transition from the managing of personnel to the leadership of people. To achieve this successfully, leaders must:

First, shift their role from the directing to the development of the human resource. In the rapidly changing markets and customer requirements of the future, with far-flung operations, it is impractical to direct the work force in the traditional sense. The development of people and infusing them with new knowledge and learning is the sure formula for future success.

To effect the transition from national performance to international entrepreneurship strategies will have to be formulated around the development of the human resource.

Secondly, leaders must provide parameters for employees to become increasingly self-managed. The employees of the future will desire a degree of autonomy and psychological ownership of the jobs which they perform. This will give them a sense of achievement and will enhance considerably the productivity of their efforts.

Thirdly, the work force and personnel of the future will contain numerous specialisms which need to interact synergistically. Business leaders must encourage and create the circumstance for team building and productive collaboration between Specialist and General Managers to achieve business results.

Fourthly, speed has become the watchword. The one common denominator in all dimensions of business in the future will be managing the increasing rate of change. Business leaders must adopt practices which stimulate speedy responses from the organisation. To achieve this, decision making must be decentralised to the lowest level possible and people must feel empowered to act rather than to keep seeking permission. To improve the quality of decision making, business leaders must ensure that employees have access to the necessary information which is required for the making of their decisions.

Finally, leadership must encourage risk-taking and innovations to face the changing challenges that organisations have to deal with in the emerging world economic order. Leaders must allow for occasional failure as a process of learning.

In developing our blueprint for the management of the human resource, it must be underscored that what we need is not meetings, seminars and proclamations, but action.

But no meaningful human resource strategy can ignore our senior citizens. The retired human resource is still an employee on pension and a elders and ambassadors of the Corporation, their interests and well-being must continue to command our due attention. Organisations that value people must prepare them to lead lives of fulfilment and achievement even after they have finished their years of productive service in the Organisation.

CONCLUSION

In conclusion, the performance of your company during the last year and indeed over the past eleven years, gives us cause for satisfaction and sanguinity. The efforts of your employees have made your Organisation a leading entrepreneur on the national scene in the paper industry. But there are developments in the environment which will engulf us and compel us to make changes that enable us to succeed in the emerging international economic order. To effect the transition from national performance to international entrepreneurship, strategies will have to be formulated around the development of the human resource. To implement these strategies will not be an easy and painless task. But there is no alternative and no escape from this challenge. Let us therefore commit ourselves and move ahead with determination and confidence.

The management of people is the key to success in the 21st Century.

Plain Tales of This Raj

Nasir Tyabji

The Child and the State in India: Child Labour and Education Policy in Comparative Perspective by Myron Weiner; Princeton University Press, Princeton, 1991, pp xvi + 213, price not stated

COLOUR supplement stories by cub reporters and earnest Master of Social-Work theses have succeeded in consigning the topic of child labour to the very softest and most boring end of the social sciences research spectrum. Child labour is perhaps the most visible manifestation of the prevailing conditions in our rural areas. But exposure through repeated voyeuristic features has led to the utter deadening of interest in it amongst people who might, for instance, rightly be agitated about the ecological effects of economic growth, nuclear power, big dams and so on. Myron Weiner's book, by relating the question of child labour to our compromising policies on compulsory education, both raises the level of the problem's analytical importance and poses the issue as pre-eminently political and not salvationist.

Weiner looks at the prevailing explanation for the supply of child labour: that poverty forces poor parents to send their children to work, that these parents do not believe that schooling would benefit their children, that the children learn skills through work. On the demand side, employers, who prefer children because they are pliable, accept lower wages, are not unionised and who ensure the industry's viability, form a powerful opposition to curbs on child labour. While Weiner does not disagree with this analysis, he is convinced that the Indian case is not unique. First World societies in the past, he argues, had substantially reduced the incidence of child labour, through policies of compulsory primary education. These measures were enforced, in many cases, long before household incomes had risen to a level where the children's contribution was marginal to the household's survival. Many Third World countries also have a substantially better record than ours.

The point, of course, is not that child labour was abolished in these countries without prolonged political struggle. In Massachusetts, for instance, legislation was passed as early as 1647 requiring all parents to ensure that their children could read. However, only in 1873 were truant officers appointed to enforce school attendance. The initial impetus in Massachusetts came from active proponents of Protestantism. However the important point that Weiner makes is that there have been a variety of impulses leading to compulsory primary education in all countries where the incidence of child labour is low.

In India, in spite of constitutional provisions for primary education (and against child labour), neither has been successfully

implemented. Myron Weiner argues that the reason for this is that these two issues are analytically interconnected, and that for the failure of both, there are deep seated beliefs, amongst civil servants and policy makers, that the resolution of these problems must wait until some basic changes occur in the structure of employment opportunities, and in the standards of primary school education.

What Weiner does not mention is that this set of beliefs forms the ideological counter part to the actually prevailing agrarian situation, that the ruling political circles are interested neither in thoroughgoing agricultural reforms, nor in the introduction of the kind of technological base requiring mass literacy. Not surprisingly then, the book ends on a note of deep pessimism.

One is left then with the pessimistic conclusion that barring a conceptual change in the thinking of those who make and implement policy and a new direction in policy by the Indian government, the number of children in the labour force will not significantly decline, conditions for working children will not significantly improve, school retention rates will not significantly increase and the literacy rate will continue to grow at a slow pace and will leave a large part of the Indian population illiterate well into the middle of the twenty first century.

If this is so, then what is unusual in Weiner's thesis? One element is his observation that child labour in India is largely a preindustrial pre capitalist component of the labour force. Another significant observation is that child labour in India represents the traditional role of the child as worker and is not the product of industrialism and capitalism. However Weiner treats these observations almost as incidentals, and does not develop their implications for his own proposals.

There is in fact a very interesting discussion of the historical changes in the way children are perceived—in the change of the view of them as valuable wage earners to that of economically useless but emotionally priceless objects which accompanied the very development of the concepts of childhood and later of adolescence. Initially of course the ruling circles, while making this distinction about their own children, denied it of the children of the working people. Weiner believes that this expression of double standards of course dominant in India is reinforced by the caste system. Given the apologetic reaction to the Mandal Commission, the depth of this feeling can hardly be missed but whether it is

especially the product of the Hindu social ethos is debatable. After all, South Asia as a whole, as Myron Weiner shows, is a black spot as far as child labour and primary education is concerned. Though Weiner does not say so, what we also share in common is a largely unmodified agrarian structure, a legacy of colonialism. Significantly in this context, Myron Weiner's Third World examples (where child labour is substantially reduced) are, firstly, China, Taiwan, South Korea, and our own Kerala. The nature of agrarian transformations undertaken by both revolutionary and post-war occupation regimes in these cases is well known. In Sri Lanka, the final case, the impetus for compulsory education came from a unique set of circumstances. This lay in a post-colonial assertion of Sinhala chauvinism, which sought correction of Tamil-Sinhala disparities in education.

The historical case studies do certainly show that the struggle to abolish child labour and introduce primary education was substantially distinct from the purely political struggles in various countries. In England, the predominant compulsion was for the appropriate socialisation of working class children, in Austria, the clergy, wishing to protect children from the revolutionary bourgeois ideals of the French revolution, was the primary force for early schooling through most of the 19th century, in the United States, puritan conceptions of the innate depravity of children and the need to overcome it through schooling provided the impetus. In Prussia, militaristic nationalists were concerned that early factory work for children reduced the labour supply for army recruitment. Measures for compulsory primary education, which prevented child labour, were thus introduced. Finally in Japan, as in England, primary education was seen as a socialisation measure after the rapid expansion of schools under the Meiji leadership.

Whatever the reasons for the diffusion of compulsory primary education in specific historical contexts, there are few signs of any forces directly political or not—pressing for it in India. It is true (although Weiner has not examined this), that after the 1985 Education Policy effectively diluted the Constitutional conception of this goal, AITUCIO did have a vigorous round of mobilisation on this issue. Education policies never have been the subject of public debate in India. Even during the independence movement when a large number of the essential components of Indian development were first formulated, debates on education played a minor role. Further, as in so many other cases, Gandhi's ideas on 'basic education' (craft or productive work as the nucleus of education) were transformed after independence. Whatever may be the views on the long term value of basic education, the pre independence proposal was at least non discriminatory, as it was expected to encom-

present-day advocates of non-formal education, work-itself-as-education, and so on, see it only as an answer to the problem of poor families in the precarious occupations.

An important point made by Weiner, though perhaps not as explicitly as is necessary, is in connection with the often-heard argument made by civil servants that there is unfortunately no political support for policy initiative in areas like education. He refers to the unexpected interest shown by the Rajiv Gandhi administration, where the new government announced its intention to review policy as early as January 1985. Although it quickly became clear that the review had no intention of addressing the real issues affecting education, the entire exercise showed that there is overwhelming political support for policy initiatives which meet political exigencies, even in areas like education, conventionally conceived as a soft area.

It is a depressing indication of the blinkered concerns stemming from such exigencies that Myron Weiner was so easily able to trip up an official of the education ministry, who showed unawareness of the distinction between legislation enabling compulsory education rules to be enforced by local authorities, and compulsory primary education as we all know it. Weiner was evidently more determined an advocate of education than all the MPs present in parliament when the New Education Policy was introduced. The official claimed that the entire matter had been 'researched' in response to a parliamentary question, so presumably the distinction between enabling and more substantive legislation was missed by the MP in question. And who knows, had the matter been pressed, could it not have plausibly been argued that education was on the concurrent list anyway?

An important issue is the relationship between the 1985 Education Policy and the Child Labour Act, finally approved in January 1987. Weiner identifies the government of India's official paper titled 'Working Paper on Child Labour in India—Implications for Educational Planning' presented to an ILO Workshop in late 1986 as providing a connecting analysis of the two policies (p 99 fn). It would have been useful if this linkage had been further developed in the book.

Given that the bulk of India's traditional exports still originate in the handicrafts sector, and the critical importance to the economy of whatever exportable commodities anyone will buy, there is now a firm vested interest in the continued use of child labour and the continued neglect of primary education. Of course, it is true that in the bulk of child-labour employing industries, export earnings are not a factor; it is equally true that to the traditional votaries of what Weiner refers to as the 'Politics of Doing Nothing' are added the high profile 'increase exports' town criers. It is significant in this context that an official of the Handloom and Handicrafts Exports Corporation,

which runs 200 training centres for children, many well below 14, felt that banning child labour in the carpet industry would be suicidal for exports. In fact, it would not be suicidal even for the carpet manufacturers. The argument, even of some well-meaning people, that 'apprenticeship' from an early age is necessary to learn the skills in occupations such as carpet weaving is also bogus. The large bulk of the children work in occupations where they learn no skill. What they do learn is to accept monotonous, repetitive, work as the norm for the rest of their lives, if they are lucky enough to continue to be employed at all when they reach an age of effective potential defiance.

The official Indian view now makes a distinction between children's labour in productive household activities and wage labour by children in non-household enterprises (which is termed exploitative.) Underlying this distinction is the assumption that the elders of a household have more positive attitudes towards the well-being of the children than does an external employer. As the concern about the implications of declining sex ratios, female infanticide and other indications of the pressures of poverty and the lust for accumulation show, it is not at all clear that collectively the household elders would have a more sympathetic attitude, at least to girl children in their care, than would employers. To that extent Myron Weiner is absolutely correct in emphasising that agencies of the state have to intervene and protect children from pressures exerted on them by their elders. The only caveat would be that the state should have a complementary

set of policies that ensure that it does not defeat its own objective in so intervening. In Indian conditions the state should then ensure an adequate livelihood (the right to work) and adequate housing (in rural areas even a house site may be the critical factor in increasing the household's ability to resist forced labour).

Child labour and illiteracy are, singly or collectively, disgraceful features of Indian society but it is not a convincing argument to say that they continue to exist because of a series of false constructs in the policy-makers' minds. It is surely not a counter-intuitive proposition that households in collectivities respond both to pressures by the state, and to opportunities for themselves. In a footnote reference on page 110, Weiner refers to studies in the changes in attitudes to children in Europe and notes that as much as five centuries separated the first signs of the notion of 'childhood' in the 13th century and the concept of 'adolescence' in the 18th. Obviously very fundamental changes took place in the economy and society over this period, and in the requirements of the ruling circles.

In India, even the concept of childhood is denied to the large mass of children. The struggle for acceptance of childhood and adolescence for all is surely tied to the struggle for a decent life for all. We must be grateful to Myron Weiner for helping to push primary education into the arena as an area of mobilisation obviously critical for this goal.

[Meena Radhakrishna has commented extensively on an earlier draft.]

POVERTY, INEQUALITY AND PRICES IN RURAL INDIA

NIKHILESH BHATTACHARYA, DIPANKOR COONDOO, PRADIP MAITI, and ROBIN MUKHERJEE

One of the most widely discussed topics in the literature on development is mass poverty, particularly in the rural sector.

This path-breaking study provides a comprehensive analysis of the absolute and relative levels of living of India's rural population over a thirty-year period (1952-83). The authors examine disparities in consumption across households in rural India, the trends in such disparities, and the trends in the incidence of absolute poverty. This is combined with an examination of the differential price trends faced by different sections of the population.

Providing as it does both a comprehensive analysis covering thirty years by sifting through an enormous mass of data and a unique theoretical model, this book will be of considerable interest to economists and to those involved in development studies.

Price Factor in India's Trade

Malati Anagol

India's Balance of Payments by G C da Costa; Himalaya Publishing House Bombay, 1990; pp 126. Rs 125.

G C DA COSTA's book on India's balance of payments could not have been at a more timely juncture than this when India is facing one of the worst balance of payments scenarios. The Seventh Plan has ended with an average trade deficit more than twice as large as that reached in the Sixth Plan. The commencement of the Eighth Plan is unmistakably facing an ominous prospect of increasingly unviable balance of payments brought on by simultaneous worsening of domestic and international environment – rising international prices of oil, shortages of essential commodities such as sugar and edible oil at home necessitating large imports, mounting debt service charges, deteriorating credit rating of the country, drying up of NRI inward remittances and deposits, less than optimistic outlook for exports with slowdown in growth in industrial countries and rising inflation at home.

da Costa analyses and unravels the factors that determined the course of India's balance of payments during the period 1970-71 to 1986-87 and makes observations, draws conclusions and recommends policy prescriptions based on his statistical analysis to tackle India's deepening balance of payments problem. It is interesting to note that the period covered by the study encompasses the decades of 1970s and 1980s – two decades as far as India's balance of payments experience is concerned. India enjoyed during the 1970s a comfortable balance of payments position when deficits in balance of payments were moderate and were financed by external assistance and country accumulated huge foreign exchange reserves which in some years were as large as ten months of financing of imports. During the 1980s, on the other hand with the slowing down of export markets abroad and liberalisation import policy, trade balances deteriorated rapidly. The reliance on commercial borrowings and NRI deposits to meet mounting deficits in balance of payments and low levels of foreign exchange reserves created concern, if not alarm, about India's balance of payments viability.

Though India enjoyed a comfortable payments position in the 1970s and difficult one in the 1980s, over the period as a whole two aspects of balance of payments of India stand out, first, the parallelism of the trade, current and overall balance, and second, the dominance of especially in the late 1970s and 1980s of trade balance in the balance of payments of the country.

The exclusive focus of da Costa's analysis is on identifying the factors in India's external and internal economic environment which have created, abated and ultimately increased trade balances over the period under study. The immediate or approximate determinants of trade balances are obviously the volume of exports, volume of imports and the net barter terms of trade which ex-

press the relative prices of imports and exports. These proximate determinants are ultimately influenced by external and internal developments, namely, movements in real incomes in industrial countries, inflation rates in those countries, trends in India's real income, movements in the real effective exchange rate of India and liberalisation of import policy.

India's volume of exports during the period under study showed two distinct phases – one covering the decade of 1970s during which the volume of exports grew at an annual average rate of 6.8 per cent per annum, and the other during the 1980s when the average rate came down sharply to 2.7 per cent per annum. These disparate movements in the volume of exports were basically related to the disparate movements, first, in the rates of growth of real incomes in industrial countries, and second, the real effective rate of exchange, which measures international competitiveness of India's exports. The first had positive and second negative influence on export performance of India during these two phases. The industrial economies which are the major trading partners of India grew at an annual rate of 3.5 per cent in 1970s as compared to an annual growth of 2.0 per cent per annum during the 1980s. As a result the Indian exports experienced a buoyancy during the 1970s while they lagged poorly in the 1980s. The real effective exchange rate fell sharply throughout the 1970s and had a positive effect on exports. However, the real effective exchange rate remained at a higher level during the 1980s, thus discouraging exports. da Costa's study clearly brings out the role played by competitiveness of exports in export performance during the period. He comments, "It does appear that the high growth in the volume of exports in the first phase is also in part attributable to the increasing competitiveness of India's export as reflected in the sizeable downward movement in the real effective exchange rate. The converse seems to be true for the second phase."

Volume of imports too underwent two distinct phases. However, unlike exports, the imports were almost unchanged and increased at an annual average rate of 3 per cent per annum only during the first phase but rose rapidly at an annual average rate of 10.3 per cent per annum during the second phase. The growth in imports was found to be directly associated with growth in real income in India and with the trend in relative prices of imports (measured by the ratio of unit value of imports and wholesale prices in India). Here again da Costa's study emphasises the role of prices in India's trade, thus, "it seems that low imports in the early years, conversely, the high imports in the later years were not only due to the relatively higher growth in the Indian economy, but

inter alia, due also to the relative lower prices of imports". The third development which influenced imports was import policy. Whereas the restrictive import policy of the first phase repressed the volume of imports, the import liberalisation policy of the 1980s increased the volume of imports by increasing the import dependence of the Indian economy. The average import-GNP ratio was 4.9 per cent for the first phase, this average shot up to 6.6 per cent during the second phase.

The third determinant of India's trade balance, namely, the net barter terms of trade rose sharply in the initial years of the 1970s and then declined sharply in the immediate post-oil crisis years. But again moved briskly up after 1980-81. India's terms of trade were basically influenced by three forces, namely, real growth in the economy of the industrial country, which had a positive effect on them, second, inflation rates in these countries which affected it in negative way, and third, India's exchange rate, the depreciation of which lowered the terms of trade and vice versa.

Thus, India's trade balance which has been dominant factor in the country's balance of payments over the period of under study was influenced by several factors in particular, real growth and inflation rates in the industrial countries, trends in India's real income, and movements in the effective exchange rates of the country and import liberalisation.

The study arrives at interesting conclusions. First, the comfortable trade balance in the 1970s and unsatisfactory trade balance in the 1980s were basically a result of the movements in the volume of exports and the volume of imports rather than the movements in terms of trade. Secondly, the real effective exchange rate has emerged as an important determinant of the movements in exports and of trade balance over the period under study. Third, for major years, dominant forces at work on India's terms of trade have been external in origin, namely, real growth and inflation rates in industrial countries. Thus, the depressed state of India's terms of trade over the period imposed a massive welfare loss from trade on the country.

G C da Costa rightly points out that since terms of trade are determined by external factors and should be taken as given, the policy focus should be on influencing the volume of exports and imports through domestic factors, namely, India's real income, India's inflation rate related to industrial countries and our import policy. In short, da Costa visualises the solution to India's persistent trade deficit through reorientation of our development strategy towards less import intensive path and financing of development by non-inflationary resources of finance which contain inflation and enhances international competitiveness of Indian exports. da Costa's book is an important contribution to the study of India's balance of payments as it highlights in unmistakable terms the role of 'price factor' in India's exports and imports.

Declining Incidence of Poverty in the 1980s

Evidence versus Artefacts

B S Minhas
L R Jain
S D Tendulkar

By constructing appropriate cost of living indices, which allow for the observed variations in consumption patterns and prices across states, the state-specific rural and urban poverty norms as well as the corresponding estimates of the incidence of poverty in 20 states and all-India in 1987-88 are presented. A set of criteria for ranking of states according to poverty alleviation performance is suggested. However, the reported numerical exercise in ranking is taken to reflect only a descriptive monitoring of the observed performance of different states between 1970-71 and 1987-88, without any pretensions to the analysis of the underlying causes of inter state differences in performance on the poverty front.

The paper also shows that the massive reduction in the incidence of poverty in 1987-88, as reported by the Planning Commission in 1990, is once again largely a consequence of the peculiar statistical artefacts used by the Commission. Just as it did with the 1983 NSS data, the Planning Commission has continued to indulge in mindless tinkering with the observed NSS size distribution of consumer expenditure for 1987-88 also. Appropriately computed incidence of poverty in 1987-88 (affecting appropriate price adjustment at the state level for the relevant poor population) comes to about 48.7 and 37.8 per cent, respectively, in rural and urban India, rather than the artificially low estimates of 32.7 and 19.4 per cent reported to parliament by the Planning Commission in 1990.

I

Introduction

IN two earlier studies [Minhas and Jain (1990) and Minhas et al (1989)] we presented state specific and all India estimates of the incidence of poverty, separately for the rural and urban population at five distinct intervals of time corresponding to five National Sample Survey (NSS) periods between 1970-71 and 1983. Recently [Minhas et al (1991)], the state specific cost of living indices for the entire rural and urban populations of twenty states for four consecutive agricultural (July-June) years from 1984-85 to 1987-88, based on two alternative weighting diagrams relating to the base years of 1970-71 and 1983, were introduced. Using the retail price data base of this latter (1991) study, this paper constructs (a) the rural and urban cost of living indices at the state and all India level for the middle fractiles considered relevant for updating the exogenously specified all India rural and urban poverty norms, (b) then estimates the incidence of rural and urban poverty in 1987-88 in twenty different states and India as a whole, and (c) undertakes a critical examination of the veracity of the Planning Commission's claim of a big fall in the incidence of poverty in 1987-88.

The layout of the paper is as follows. In Section II, we take up the construction of state specific cost of living indices for the middle-range of rural and urban populations for 1987-88 with 1970-71 as the base year. Here we also undertake updating of the inter-state price differentials separately for

the middle range of rural and urban populations from 1970-71 to 1987-88 and work out the state specific rural and urban poverty lines in 1987-88. The estimates of the incidence of rural and urban poverty in each state and all India in 1987-88 along with those for 1970-71 and 1983 are presented in Section III. This section also examines and analyses the comparative movements in state specific poverty incidence and numbers of the poor over the two successive time periods (1970-71 to 1983 and from 1983 to 1987-88) and also across the rural and urban sector of each state during each one of these two time periods. In Section IV, we compare our estimate of rural and urban poverty at the all India level for the 1980s with those provided by the Planning Commission. The paper closes with concluding remarks which comprise Section V.

II

State-Specific Rural and Urban Cost of Living Indices for Middle Population and Poverty Norms, 1970-71, 1983, 1987-88

To adjust the exogenously specified poverty norm for price changes at the state level one requires state specific cost of living index relating to the relevant section of the population. This relevant section of the population referred to as the middle range of the population, is taken to comprised persons falling within a range of monthly per capita total expenditure (MPCTE) which encloses the state specific poverty norm in the base year. Such state specific cost of

living indices for the middle range of population were obtained earlier for rural areas by Minhas and Jain (1990) and for urban areas by Minhas et al (1988) for National Sample Survey (NSS) years 1972-73, 1973-74, 1977-78 and 1983 with 1970-71 as the base year and using 1970-71 NSS consumer expenditure part in of the rural or urban middle population as the relevant weighting diagram. The price data used were the adjusted price relatives of the consumer price index series for agricultural labourers (CPIAL) for rural areas and the combined price relatives data of the consumer price index series for industrial workers (CPIIW) and for non manual employees (CPINM) for urban areas.

In this study we make use of the same 1970-71 weighting diagrams for the middle range of the rural and urban populations and the price relatives data of the same three series for the agricultural year 1987-88 as used in Minhas et al (1991) to construct statewise and all India cost of living indices (CPIR and CPIU), relating to the rural and urban middle populations, for 1987-88 with 1970-71 as the base year. These are presented in Table I. We also present in Table I the state specific cost of living indices (CPIR and CPIU) for the total rural and urban populations for 1987-88 with 1970-71 = 100 [which are carried over from Minhas et al (1991)] and the state specific price indices relative to all India (SVIR and SVIU) separately for the rural and urban middle population for the years 1970-71 and 1983. These are taken from our earlier studies [Minhas and Jain (1990)] for rural

and [Minhas et al (1989)] for the urban population. For a given state, applying CPIMR (CPIMU) for 1987-88 (1970-71 = 100) to SVIR (SVIU) in 1970-71, we obtain SVIR (SVIU) in 1987-88 and present them in Table 1 with a view to facilitating a comparison of the inter-state price differential (relative to all-India) over time from 1970-71 to 1987-88.

In 1987-88, the cost of living index for the middle population (CPIM), compared to that for the total population (CPIT), is found to be on the lower side for all states except Bihar, Orissa and West Bengal in the rural sector and five states of Gujarat, Himachal Pradesh, Jammu and Kashmir, Maharashtra and UP in the urban sector. This shows that the use of CPIT, instead of the appropriate CPIM, at the state level will cause the poverty norm and the poverty incidence to be over-stated in most of the states, both in the rural and urban areas.

Inter-state differential in the price index (relative to all-India) for the middle population (SVI) in 1970-71, 1983 and 1987-88 are found to be different from year to year in the rural as well as urban areas [see Table 1, Columns (7) to (12)]. SVI—in percentage terms—had the minimum value for (a) Andhra Pradesh in all the three years, i.e., 91.3, 86.2 and 86.0 per cent in the respective years 1970-71, 1983 and 1987-88 in the rural areas, and (b) Jammu and Kashmir (78.5 and 81.6 per cent) in 1970-71 and 1983 and Himachal Pradesh (82.2 per cent) in 1987-88 in the urban areas.

Maximum value for SVI in the rural sector was experienced by West Bengal (124.8) in 1970-71 and Kerala (118.3 and 126.3) in 1983 and 1987-88; and by Delhi (118.8), Orissa (116.8) and Delhi (115.3) in the same three respective years in the urban sector.

There was no discernible pattern in the movement of SVI over time from 1970-71 to 1987-88 for the various states. Both in the rural as well as the urban sector, there were states experiencing rise (decline) during period I from 1970-71 to 1983, followed by rise (decline) over the next period II from 1983 to 1987-88. On the other hand, there were other states which experienced rise (decline) during period I, followed by decline (rise) in period II.

We have taken the all-India rural and urban poverty lines as exogenously specified by the Planning Commission, i.e., monthly per capita total expenditure (MPCTE) of Rs 49.09 (rural) and Rs 56.64 (urban) at all-India level, both at 1973-74 prices.² These poverty norms need to be converted to prices prevailing in the survey years 1970-71, 1983 and 1987-88 for estimating the incidence of poverty in these years. For this purpose, we have used the appropriate cost of living indices for the relevant middle-range of population as described above. For the years 1970-71 and 1983 (with 1973-74 = 100), these indices are taken from earlier studies [Minhas and Jain (1990) for rural middle-range population and Minhas et al (1989) for the corresponding urban population]. For the year 1987-88, we have made use of the

indices presented in Table 1. These all-India poverty norms for 1970-71, 1983 and 1987-88 are converted to the state-specific prices by using the SVI for the respective years given in Table 1. The state-specific poverty norms, thus obtained, are presented in Table 2. Given the foregoing procedure, there is an obvious one-to-one relationship between the state-specific poverty norms and the state-specific SVI.

It may be noted from the results reported in Table 2 that, compared to all-India, the state-specific poverty norm in all the three years turned out to be on the lower side for four states in the rural and ten states in the urban sector; and, on the higher side, for twelve states in the rural and eight states in the urban sector. The states whose poverty norms fluctuated around the all-India poverty norm over the three years were Gujarat, Jammu and Kashmir, Rajasthan and Tamil Nadu in the rural areas and Karnataka and Tamil Nadu in the urban areas. Among all the states, in all the three years, the lowest poverty norm³ was noticed for AP in the rural and Jammu and Kashmir (except that it was the second lowest in 1987-88) in the urban areas. Kerala had the highest poverty norm in the rural areas (except that it was second to West Bengal in 1970-71), whereas in the urban areas the poverty norm of Delhi was the highest except in 1983 when urban Orissa had the highest poverty norm.

Line 22 in Table 2 presents the range in poverty norms across states as per cent of all-India poverty norm which provides an idea of the relative variability in poverty norms across states. This relative range can be seen to have declined over time in the three selected years for the urban population. For the rural

population, it increased in the drought year 1987-88 compared to the earlier two years. The inter-state relative variability fluctuated between 33.4 and 40 per cent, both in the rural and urban sectors, over the three years falling in the time period from 1970-71 to 1987-88.

III

Estimates of Rural and Urban Poverty Incidence

At the state and all-India level, we use the poverty line estimates obtained in Section II, along with the size distributions³ of per capita total expenditure (PCTE) available from the NSS, to calculate the headcount ratio measure of poverty incidence, separately for the rural and urban areas in each of the years 1970-71, 1983 and 1987-88. For this purpose, we have followed the procedures of simple linear interpolation between log x and P where x denotes monthly PCTE and P the proportion of state-specific population (rural or urban) with monthly PCTE less than or equal to x. Other non-linear interpolation procedures between x and P, which are more sophisticated but computationally more cumbersome than ours, have been noted to yield virtually the same estimate of the headcount ratio. We have therefore preferred the computationally simpler procedure. A comparison of alternative all-India estimates of headcount ratio and numbers of the poor are presented in Tables 3 and 4. The estimated rural and urban headcount ratios for each of the 20 states (as also all-India) are presented in Table 5. We also provide in Table 5 the estimate of headcount ratio at the entire state level which is obtained as a weighted average of rural and urban estimates, with the state-

TABLE 1: STATEWISE CONSUMER PRICE INDICES FOR MIDDLE (CPIM) AND TOTAL (CPIT) POPULATION FOR 1987-88 (1970-71 = 100) AND STATE SPECIFIC PRICE INDICES (RELATIVE TO ALL INDIA) FOR MIDDLE POPULATION FOR 1970-71, 1983 AND 1987-88: RURAL AND URBAN AREAS

specific rural and urban populations as weights. For the statewide rural and urban populations, we have used the 1971 census estimates for the year 1970-71, the estimates given in *Sarvekshana*, Vol XI, No 4, Issue No 35, April 1988 (p S-222) for 1983 and the estimates given in *Sarvekshana*, September 1990, Special Number, Statement 1, (p 16) for 1987-88

OVERVIEW OF ALL-INDIA ESTIMATES

At the all-India level, two alternative estimates of headcount ratio can be derived (i) an estimate based on the all-India poverty line and the all India size distribution of PCTE, and (ii) the population weighted average of state-specific headcount ratios using state-specific poverty lines and state specific size distributions of PCTE. The estimate (i) can be shown to be equivalent to the population weighted average of state specific headcount ratios using a uniform all India poverty line for each of the states and state-specific size distributions of PCTE. Consequently, the difference between estimates (i) and (ii) boils down to the use of a uniform poverty line across states in (i) and state specific price adjustment factors in (ii). As a short hand description, we call estimate (i) as the direct all India estimate and estimate (ii) as the estimate aggregated over 20 states or the weighted average estimate. These two estimates are presented in columns (4) and (6) respectively in Table 3 for three time points of 1970-71, 1983 and 1987-88 and for the rural urban and combined (rural plus urban) populations, separately. Between these two estimates, the aggregated headcount ratio for 20 states (i.e. aggregated all India estimate or the weighted average estimate) is conceptually superior as a representative all India estimate. This is so because it allows for state specific variations in prices relevant to the poor population in each state.

Applying this weighted average headcount ratio to the all India population, we obtain the all India estimate (which we call the alternative estimate) of the number of the poor, which is presented in column (8) of Table 3. Two other estimates of the number of the poor are also given in Table 3. One of these, which appears in column (5) is derived by applying the direct all India estimate of the headcount ratio (in column 4) to the all India estimates of population. The other estimate, which is given in column (7), is an aggregate of the numbers of the poor in 20 states considered in this study. We prefer the estimate given in column (8) to those in columns (5) and (7) because of the more comprehensive coverage in terms of population as well as due to the fact that state-specific price variations are taken into account in its estimation.

Based on the aggregated results for 20 states given in Tables 3 and 4, the following findings may be noted. Both at the rural and the urban sector level, the headcount ratio estimate aggregated for 20 states (column 6) is higher than the direct estimate (column

4). The same holds for the alternative (column 8) and the direct (column 5) estimates of the numbers of the poor. Obviously, the differences in the two estimates are attributable to the different state-specific poverty lines used in deriving the aggregated headcount ratios in column (6). It is worth noting that substantial under-statement is involved—about 4 percentage points—in the direct estimate of headcount ratio in 1987-88 compared to the aggregated estimate for all India rural. This amounts to under-estimating the numbers of the rural poor by about 22 million in 1987-88 in comparison with the

use of the conceptually better, aggregated estimate of headcount ratio.

A continuous decline in the headcount ratio in the three selected years, both in the rural and the urban areas, is indeed apparent. Over twelve and a half years (period I) between 1970-71 and 1983, rural headcount ratio declined by 8 percentage points (from 58.8 per cent to 50.8 per cent) and the urban ratio declined by 6.5 percentage points (from 46.2 to 39.7 per cent). In the next four and a half years (period II) between 1983 and 1987-88 the headcount ratio declined further by 2 percentage points for both the

| 8 | Urban | 1987-88 | 36.52 | 74.962 | 37.76 | 76.569 | 77.496 |
| 9 | Rural and Urban | 1987-88 | 42.70 | 336.417 | 45.85 | 357.830 | 361.160 |

Note: These are based on the Planning Commission poverty lines of monthly PCTE of Rs 49.09 and Rs 56.64 for all India rural and urban population respectively at 1973-74 prices.

Source: Table 1.

rural and the urban populations. The combined (rural plus urban) headcount ratio registered a continuous decline from 56.3 (1970-71) to 48.1 per cent (1983) and further to 45.9 per cent in 1987-88. The compound annual rate of decline in the headcount ratio in period II (0.9 and 1.1 per cent for all-India rural and urban) was slightly lower than that in period I (1.2 per cent both for all-India rural and urban), with no significant differences across the rural-urban dimension.

An interesting aspect of the movements in headcount ratio is the decline between 1983 and 1987-88. This is particularly striking because 1987-88 was widely publicised as being severely affected by the so-called 'worst drought', and in previous experience, the headcount ratio had always tended to rise in years of bad agricultural harvests. It would therefore be useful to comment on the possible reasons for this decline in 1978-88, even though detailed analysis is not possible within the scope of the present paper. First, the year 1987-88 was not marked by a substantial production loss. The foodgrains production in physical terms was reported to have declined from 143.42 million tonnes in 1986-87 to 140.35 million tonnes in 1987-88 or a little over 2 per cent decline over the year previous to 1987-88. The index of foodgrains output (base triennium ending 1969-70 = 100) showed a slightly higher decline of 2.7 per cent over the previous year. The index of production for non-foodgrains actually registered a rise of a little over 3.5 per cent. Consequently, income losses due to drought might not have been very serious. Secondly, efforts were made to offset the possible income losses due to drought by stepping up special wage-employment programmes. On the top of this, the stability in food prices was maintained through large releases of foodgrains in the public distribution system.⁴ This explanation is also supported by the findings of the employment/unemployment survey of the NSS conducted in 1987-88, which showed a decline in the person-day rate of rural unemployment in 1987-88 compared to 1983.⁵

In contrast to the movement in the headcount ratio, the absolute numbers of the poor increased continuously in both the rural and the urban sectors. The increase, based on column (8) of Table 3, was of the order of nearly 19 million in period I for both the rural and the urban population. In period II, the increase of over 8 million in the numbers of the urban poor was about 1.5 million higher than the increase in the numbers of the rural poor. While the rate of population increase could not be offset by the rate of decline in the headcount ratio, the impact of population growth was considerably sharper for the urban population. The compound annual rate of growth of the rural poor varied between 0.5 and 0.6 per cent, whereas for the urban poor it was as high as 2.5 to 2.6 per cent during both the periods. For the combined (rural plus urban) poor population, the rate of growth

was of the order of 0.9 per cent per annum in the two periods under consideration. This may be compared with the compound annual rate of growth of total population of around 2.2 per cent over the same period.

STATE LEVEL RESULTS

State-specific headcount ratios for 20 states are presented in Table 5 for the rural, urban and combined (rural plus urban) population. A casual examination of this table suggests a fair amount of inter-state variability every year and for different segments of the population. In analysing the patterns emerging from this table, we do not consider the rural and the urban segments of Manipur, Tripura and Delhi and confine our discussion in this section to the remaining seventeen major states.⁶ The very small size of the population of Manipur, Tripura and Delhi (rural) compared to the remaining major states introduces an element of dis-

continuity in terms of size which may distort the inferences about inter-state variability. Delhi (urban) has a large population but its metropolitan city character makes it non-comparable to the urban populations of the other major states where metropolitan cities form only a part of the urban population and that too only in a few states. It would be more appropriate to compare Delhi (urban) with other metropolitan cities, such as Bombay, Calcutta and Madras. This comparison, however, is not possible in the absence of separate data for other individual metropolitan cities.

In analysing the statewide results, we consider the following three aspects. First, we present a summary picture in terms of the aggregated headcount ratios for 17 major states, and certain summary indicators of disparity in the headcount ratios across 17 states. Next we consider the categories of the 17 states with reference to their poverty

TABLE 4 CHANGE IN THE NUMBER OF POOR BETWEEN PERIODS 1970-71 TO 1983 AND 1983 TO 1987-88—ALTERNATIVE ALL INDIA ESTIMATES

alleviation performance as judged by the level of the state specific headcount ratio in relation to that at the all-India level in each of the three years. Thirdly, we attempt an exercise of ranking different states on the basis of their poverty alleviation performance in terms of their annualised rates of change in the headcount ratio and the number of the poor over the two periods 1970-71 to 1983 and 1983 to 1987-88. In this connection, we propose certain plausible criteria for ranking and indicate the rank order position of each state for the rural and the urban population separately.

Summary Picture of State-Specific Poverty Incidence (Headcount Ratio)

Based on data relating to 17 major states for three different years in the 1970s and 1980s for each segment of the population, Table 6 provides the following summary information:

- (i) weighted average headcount ratio for 17 states taken together,
- (ii) minimum and maximum values of the headcount ratio among the 17 states and
- (iii) weighted coefficient of variation across 17 states.

The following regularities can be perceived from Table 6. First, for the rural population, Punjab has the lowest headcount ratio and Bihar the highest in all the three years (with the exception of 1970-71 when West Bengal featured in that position). Given the large weight of the rural population, Punjab and Bihar occupy the same extreme but opposite positions for the combined (rural plus urban) population. While the lowest headcount ratio in the urban areas is experienced by Himachal Pradesh in all the three years, no single state consistently appears at the worst slot. Similar to the situation noted above for 20 states, the weighted average headcount ratio for 17 major states also shows a decline over the time periods considered in this study. Inter-state relative disparity in the headcount ratio, as measured by the weighted coefficient of variation, shows a slight tendency to rise for the urban population over the three time points. For the rural as well as the total (rural plus urban) populations, the inter-state relative disparity shoots up in 1983 as compared to 1970-71 before registering a decline in 1987-88. Notice that the weighted average rural or urban headcount ratio for 17 states (given in column 6 of Table 6) declined at the rate of 1.15 per cent per annum (pcpa) between 1970-71 and 1983 and 0.88 pcpa between 1983 and 1987-88 (Tables 8 R and 8 U, last line and columns 4 and 5). Given this movement in the weighted average headcount ratio, an increase in the weighted coefficient of variation simply reflects the fact that the decline in headcount ratio was not evenly shared by all the states, especially for the urban population. For the rural population, relative inter-state disparities

remained virtually unchanged when we compare the two end points of 1970-71 and 1987-88.

We may also note some other broad regularities emerging from Table 5 which have been subsumed in the summary picture presented in Table 6. First, Assam (rural) and Bihar (urban) had the unique but dubious distinction of registering a higher headcount ratio in 1987-88 in comparison with both 1970-71 and 1983. Similarly, the rural populations of five states (Assam, Gujarat, Himachal Pradesh, Jammu and Kashmir and Punjab) and the urban populations of six other states (Andhra Pradesh, Bihar, Karnataka, Madhya Pradesh, Rajasthan and West Bengal) did not experience a decline in the incidence of poverty (headcount ratio) between 1983 and 1987-88.

Categories of States on Basis of Level of Headcount Ratio

On the basis of the level of state specific headcount ratios in each of the three years, we distinguish three categories of states, namely:

Category A: those states having headcount ratio above all India level in all the three years.

Category B: those states having headcount ratio below all India level in all the three years.

Category F: the states excluding those in category A or B, i.e. states having fluctuations from year to year in the position of their headcount ratio in comparison with the all India level.

Table 7 provides the listing of states in categories A, B and F for the rural and urban populations. For each of these cate-

gories and for each year, we also provide additional information on:

- (i) the weighted average headcount ratio for the category,
- (ii) the numbers of the poor in the category, and
- (iii) the percentage share of the category in the numbers of the poor in 17 states together.

It may be noted that category A turns out to be numerically the largest, with its share ranging between 46 and 48 per cent for the rural poor and between 49 and 51 per cent for the urban poor population over the period from 1970-71 and 1987-88. The rural poor population in the three eastern states of Bihar, Orissa and West Bengal along with Madhya Pradesh and Tamil Nadu belong to this category. The weighted average headcount ratio in these five states is 10 to 12 percentage points above that for the 17 states together. In the urban areas, six states (Bihar and Orissa in the east, Kerala and Tamil Nadu in the south along with Uttar Pradesh and Madhya Pradesh) belong to category A, with its weighted average headcount ratio exceeding that for the 17 states together by six to 10 percentage points. The absolute numbers of the poor in category A increased over the three time points for the urban population, whereas in the rural sector it increased between 1970-71 and 1983 before registering a slight decline between 1983 and 1987-88.

Category B was numerically the smallest, as one should expect. In the rural segment, it included the north and north-western states of Jammu and Kashmir, Punjab, Haryana, Himachal Pradesh and Rajasthan along with Andhra Pradesh and Karnataka.

TABLE 6. WEIGHTED AVERAGE, MINIMUM AND MAXIMUM HEADCOUNT RATIO AND INTER-STATE COEFFICIENT OF VARIATION FOR 1970-71, 1983 AND 1987-88—RURAL, URBAN AND COMBINED POPULATION

| (Per cent) | | | | | | |
|-------------|---------------------------|----------|-------------|------------------------|------------------------|----------|
| Sl. No. (1) | Segment of Population (2) | Year (3) | Average (4) | Minimum (5) | Maximum (6) | C.V. (7) |
| 1 | Rural | 1970-71 | 58.78 | 27.7(J&K) 28.7(PNB) | 76.7(WB) | 18.66 |
| 2 | Rural | 1983 | 50.86 | 18.5(PNB) | 70.4(BHR) | 25.26 |
| 3 | Rural | 1987-88 | 46.88 | 21.0(PNB) | 66.3(BHR) | 19.20 |
| 4 | Urban | 1970-71 | 46.78 | 18.7(HP) 19.0(ASM) | 62.4(KER) | 21.01 |
| 5 | Urban | 1983 | 40.31 | 7.1(HP) | 52.5(ORS) 52.0(MP) | 22.14 |
| 6 | Urban | 1987-88 | 38.78 | 3.3(HP) | 56.7(BHR) | 24.15 |
| 7 | Combined | 1970-71 | 56.44 | 27.5(J&K) 27.7(PNB) | 68.0(KER) 67.3(BHR) | 17.29 |
| 8 | Combined | 1983 | 48.39 | 19.4(PNB) | 67.9(BHR) | 23.48 |
| 9 | Combined | 1987-88 | 46.32 | 18.0(PNB) | 64.9(BHR) | 21.89 |

Notes: (1) Column (4) provides a weighted average headcount ratio for 17 major states excluding Manipur, Tripura and Delhi. Weights are state specific populations.

(2) Along with the state experiencing minimum or maximum headcount ratio, we also provide the next state in rank whenever it is within one percentage point range of the minimum or maximum.

(3) C.V. refers to weighted coefficient of variation across 17 major states. Weights are the state specific populations.

(4) For explanation of the abbreviations used for state names, see Table 2.

in the south. Their group's headcount ratio was 10 to 16 percentage points below the average headcount ratio for 17 states. In the urban areas, this category included Jammu and Kashmir, Punjab, Haryana and Himachal Pradesh along with Assam and, interestingly, the eastern state of West Bengal which happens to be in category A for the rural sector. The urban headcount ratio for this category B was 16 percentage points below the average headcount ratio for 17 states.

The residual category F covered over one-third of the rural and two-fifths of the urban poor population. Among others, it included Uttar Pradesh and Maharashtra in the rural segment and Andhra Pradesh, Karnataka and Maharashtra in the urban segment.

The group headcount ratio showed a decline in all the categories over the three time-periods.

Exercise in Ranking of States according to Poverty Alleviation Performance

In this section, we attempt to rank different states with reference to performance in poverty alleviation in terms of the compound annual rates of change in the headcount ratio (*h*) and/or in the numbers of poor (*n*) between 1970-71 and 1983 (period I) and 1983 and 1987-88 (period II). We would like to caution the reader on two counts. First, *h* or *n* should *not* be mistaken for *trend* rates of change. This is because the incidence of poverty has been known to fluctuate from year to year depending on the state of agricultural harvest and these year-specific effects are confounded with 'trend' effects in the observed indicators of poverty incidence. Secondly, the 'performance' of each state, as measured by the observed rate of change, *h* or *n*, is also affected by factors beyond the control of each state as much as by those which it can control. This distinction is necessary if the ranking is to be used for policy purposes, such as allocation of central funds for poverty alleviation. However, it is not possible to implement this distinction in practice and to decompose *h* or *n* into those factors which are beyond and those which are within the control of each state. Our exercise may therefore be taken to reflect only a descriptive monitoring of the observed performance of different states without any pretension of analysing the underlying causes.

As regards the criteria for ranking, there is a wide set to choose from, and different combinations would not necessarily yield the same ranking. The ranking criteria that we have adopted are based on the principle of plausibility and simplicity in interpretation and consist of a sequence of steps with a criterion specified at each stage.

Step 1: Since we have two periods I and II, we first classify the states into three broad categories, namely, (A) those states which managed to reduce the headcount ratio in both the periods

(B) those states which experienced a rise in headcount ratio in period I followed by a decline in period II or vice versa.

(C) those states which experienced a rise in the headcount ratio in both the periods.

Clearly, category (A) is preferred to (B) and category (B) preferred to (C).

Step 2: Within category (A), we may distinguish two groups in order of preference, namely,

A(i): those states which managed to reduce the absolute numbers of the poor in both the periods.

A(ii): those states which did not manage to reduce the absolute numbers of the poor in both the periods.

Similarly category (B) may be sub-divided into two groups in order of preference, namely,

B(i): those states where increase in headcount ratio in period I is followed by a decline in period II,

B(ii): those states where the decline in the headcount ratio in period I is followed by an increase in period II.

Step 3: Within A(i) and A(ii) we adopt the following criteria for further sub-grouping, again in order of preference:

I₁: rate of decline in the headcount ratio in period II is *higher* than in period I,

I₂: rate of decline in the headcount ratio is *higher* in period I than in period II.

Step 4: Within each of the sub-groups formed by following the three steps outlined above, we rank the states in ascending order of the rate of growth of numbers of the poor in period II. This criterion gives the entire weight in ranking to the performance in poverty alleviation in the latest period. It takes into account not only the movement in the headcount ratio but also the impact of the state-specific population growth on the numbers of the poor over period II.

The foregoing sequence of four steps, using a plausible criterion at each step, provides us with the unique ranking of the states with reference to the observed performance in terms of the *rate* of poverty alleviation over the two periods. We admit that it may be possible to devise alternative criteria for ranking. However, we have made explicit our own basis of evaluation and ranked the states accordingly. Seventeen states, so ranked, are listed in Table 8.R, for the rural population, and in Table 8.U, for the urban population.

In the rural sector, two reasonably big states of Andhra Pradesh and Kerala managed to reduce both the headcount ratio and the number of poor in *both* the periods. Consequently, their share in the poor population for 17 states together declined from nearly 12 per cent in 1970-71 to about 8.5 per cent in 1987-88. Six states—West Bengal, Tamil Nadu, Madhya Pradesh, Uttar Pradesh, Haryana and Rajasthan, in that order—accounting for nearly half the rural poor population for 17 states together in the three years, experienced a decline in the headcount ratio in *both* the periods but the decline was not sufficient in relation to

population growth, therefore they did not manage to reduce the numbers of the poor in both the periods. Noteworthy within this group are West Bengal, Tamil Nadu and Madhya Pradesh, where the absolute numbers of the poor got reduced in the second period. At the worst end is the state of Jammu and Kashmir, where the headcount ratio increased in *both* the periods. Next to Jammu and Kashmir are Gujarat and the agriculturally prosperous Punjab, where the decline in the headcount ratio in period I was followed by an increase in the headcount ratio in period II, as a result of which the absolute numbers of the poor increased in period II at the compound annual rate of 4.5 per cent (Gujarat) and 4 per cent (Punjab).⁷ Fortunately, these three states accounted for less than five per cent of the total poor population for 17 states together in 1983 and 1987-88.

In the urban segment, only the small state of Himachal Pradesh experienced a decline in *both* the headcount ratio and the numbers of the poor. Numerically, the most dominant group consisted of seven states (including Uttar Pradesh, Madhya Pradesh and Kerala) where there was a decline in the headcount ratio in *both* the periods. Their combined share in the total number of urban poor for 17 states together declined from nearly 44 per cent in 1970-71 to 39 per cent in 1987-88. The second largest category of six states experienced a decline in the headcount ratio in period I, followed by a steep rise in period II. Combined with population growth, this led to very high compound annual rates of growth of the urban poor in period II, varying between 8.1 per cent in Karnataka (at the worst end) to 3.8 per cent in Gujarat. Apart from these two extreme cases, other states in this category included West Bengal, Andhra Pradesh, Bihar and Rajasthan. The share of this category in the urban poor for 17 states together increased from about 41 per cent (1970-71) and 39 per cent (1983) to nearly 45 per cent in 1987-88. The highly urbanised state of Maharashtra was in the middle (rank 10) of the ranking of the states.

Looking at both the rural and the urban segments simultaneously, we observe that Madhya Pradesh has the same rank (number 5 from the top) in both the rankings. Tamil Nadu and Uttar Pradesh have also done well in both the segments with reference to the rate of poverty alleviation. Maharashtra and Orissa are in the middle. No state is consistently at the worst-end in terms of the rate of poverty alleviation. Karnataka and Gujarat are in the bottom half, the former occupying the lowest rank in the urban sector and the latter state being second from the bottom in the rural segment.

IV

Official Estimates of Poverty Incidence in 1980s: A Comparison

Official estimates of the headcount ratio are periodically released by the Planning

Commission. For the year 1987-88, official estimates were released recently in reply to a question in parliament. Table 9 presents a comparison of the appropriately computed estimates of the headcount ratio at the all India level with those reported by the Planning Commission, as well as those computed by us using the Planning Commission procedures for 1983 and 1987-88. [Notice that our estimates are based on the uniform poverty line (as those of the Planning Commission) but using the conceptually more appropriate price-adjustment as discussed in Section II.] The Planning Commission's estimates use (a) the implicit deflator of private final consumer expenditure (PFCE) for adjusting the poverty line for price changes between the price-base of the poverty line and the current year, and (b) the *pro rata* adjustment factor to adjust for the differences between the National Account Statistics (NAS)-based PFCE and the NSS-based aggregate household consumer expenditure (AHCE). Relative size distribution of per capita total expenditure (PCTE) from NSS is used along with adjustments (a) and (b) to derive the official estimates of the headcount ratio.

A comparison of lines 1(a) and 2(a) in Table 9 indicates that our estimates of headcount ratio are nine to 10 percentage points higher than those of the Planning Commission for the year 1983. The differences are much wider for 1987-88, namely, 12 percentage points for the rural population and as high as 17 percentage points for the urban population. These differences can be traced to the two adjustments (a) and (b) mentioned in the last paragraph. The implicit

deflator of PFCE used in (a) ignores rural-urban price differentials as well as rates of price changes faced by the rural and the urban population. It has also been shown that the implicit deflator of PFCE tends to understate⁴ the actual price rise, which, on the other hand, is better captured in our conceptually appropriate consumer price index for the middle-range of the population. The Planning Commission procedure leads to an understatement of the poverty line and hence of the headcount ratio. However, a quantitatively much more significant source of difference lies in the use of *pro rata* adjustment by the Planning Commission and this adjustment factor for 1987-88 comes to about 1.275 (see Appendix). In other words, for 1987-88, the PCTE of each fractile group is increased by 27.5 per cent before applying the underestimated poverty line to the observed size distribution of NSS. It should be obvious that this would bring about a massive (but artificial) reduction in the headcount ratio.

We tried to verify, for the year 1987-88 the estimates reported by the Planning Commission, using the Planning Commission's procedure and the latest available data sources. We present the details of these estimates in the Appendix. Our replication of the Planning Commission's procedure yielded the estimates of headcount ratios which turned out to be lower than those officially reported [compare lines 2(b) and 3(b)]. We are unable to trace the sources of these differences on the basis of available information. However, our calculations bring out clearly the massive difference made by the *pro rata* adjustment factor. A

comparison of lines 3(b) and 4(b) show that, in the absence of *pro rata* adjustment factor, the headcount ratio would have been as high as 51 per cent instead of 29 per cent for the rural population and 33.5 per cent instead of 17.5 per cent for the urban population in 1987-88.

This procedure, and especially the *pro rata* adjustment factor, has been critically discussed in a number of recent papers. As early as 1987, a scrutiny of this procedure pointed to the questionable nature of the *pro rata* adjustment in the light of wide differential distributional aspects of consumer behaviour on the composition of the consumer basket [Minhas et al (1987), p. 46]. A later paper [Minhas (1988)] undertook detailed cross validation exercise for critically assessing the different sources of discrepancies between NSS and NAS estimates of consumer expenditure at a detailed disaggregated level for 1972-73 and 1977-78. This exercise was extended to 1983 in yet another paper [Minhas and Kansal (1989)]. These papers have been in the public domain for some years and clearly indicate not only the questionable nature of *pro rata* adjustment of the observed size distribution of consumer expenditure by the Planning Commission but also favour the headcount ratio estimates based on the NSS data without any adjustment. Even when adjustment might be warranted for achieving consistency between NSS and NAS estimates of consumer expenditure, a case could be made for item group specific adjustments (rather than the *pro rata*) which could take into account the results of the aforementioned exercises. However, the Planning Commission has not bothered to learn from them and has been merely using the same old, analytically and empirically questionable methods leading to generation of misinformation about country's progress on the poverty alleviation front. The massive reduction in the incidence of poverty between 1983 and 1987-88, as reported by the Planning Commission is a consequence of the peculiar statistical artefacts used by it. As against the Planning Commission's estimate which would have us believe that the incidence of rural (urban) poverty in 1987-88 has fallen to 32.7 per cent (19.4 per cent), the estimate with appropriate price adjustment at all India level would be around 44.9 per cent for rural and 36.5 per cent for urban India.

Concluding Remarks

After constructing appropriate cost of living indices (for the middle range of population) which allow for the observed variation in consumption patterns and prices of various goods and services across different states, the state specific rural and urban poverty norms as well as estimates of the incidence of poverty in the rural and urban segments of 20 states/union territories in 1987-88 have been presented in this paper. The following results which emerge from the

TABLE 7. POVERTY ALLEVIATION PERFORMANCE: CATEGORIES OF STATES BASED ON THE LEVEL OF STATE SPECIFIC HEADCOUNT RATIO (Rural and Urban Population)

| Sl. No. | Category | State | Headcount Ratio (Per Cent) | | | Number of Poor (Million) | | |
|-------------------------|----------|---------------------------------|----------------------------|-------|---------|--------------------------|--------------------|--------------------|
| | | | 1970-71 | 1983 | 1987-88 | 1970-71 | 1983 | 1987-88 |
| (1) | (2) | (3) | (4) | (5) | (6) | (7) | (8) | (9) |
| Rural Population | | | | | | | | |
| 1 | A | BHR, MP, ORS, TN, WB | 69.36 | 63.24 | 58.53 | 116.304 (45.7) | 130.765 (47.8) | 129.114 (46.0) |
| 2 | B | AP, HRY, HP, J&K, KRN, PNB, RJN | 47.72 | 34.52 | 34.26 | 49.666 (19.5) | 44.963 (16.4) | 47.672 (17.0) |
| 3 | F | ASM, GJT, KER, MHR, UP | 54.94 | 48.72 | 41.34 | 86.505 (34.8) | 97.856 (35.8) | 103.688 (37.0) |
| 4 | | 17 States together | 58.78 | 50.86 | 48.88 | 254.475 (100.0) | 273.584 (100.0) | 280.474 (100.0) |
| Urban Population | | | | | | | | |
| 5 | A | BHR, KER, MP, ORS, TN, UP | 55.91 | 48.68 | 44.47 | 23.810 (48.8) | 33.639 (50.6) | 36.686 (48.7) |
| 6 | B | ASM, HRY, HP, J&K, PNB, WB | 31.34 | 24.89 | 22.51 | 5.551 (11.4) | 6.846 (10.3) | 7.164 (9.5) |

| 8 | | 17 States together | 46.78 | 40.31 | 38.78 | 48.74 (100.0) | 66.537 (100.0) | 75.325 (100.0) |

Notes: (1) Figures within brackets refer to category specific percentage share in total poor population of 17 states together in a given year.

(2) For explanation of the abbreviations used for state names, see Table 2.

(3) For explanation of categories A, B and F, see text in Section III.

(4) Headcount ratios in columns (4), (5) and (6) are obtained as weighted average of those of the states belonging to the category with state specific populations as the weights.

comparative analysis of all-India and state-specific poverty incidence and the numbers of the poor in 1970-71, 1983 and 1987-88, are worth noting:

(1) In comparison with the conceptually better estimate obtained through aggregation over the states, the so-called direct estimate of the headcount ratio for rural India in 1987-88 turned out to be an underestimate by about four percentage points, implying an underestimation of the numbers of the rural poor by about 22 million. Changes in the numbers of the poor (CNP) over period (1970-71 to 1983), based on the direct all-India estimates, were underestimated by about three million in each of the two sectors (rural and urban) in comparison with the corresponding aggregated estimates. Over the next period (1983 to 1987-88), the direct estimates of CNP were lower by about 12.5 million in the

rural sector, but higher by about one million in the urban sector than those obtained from the aggregated estimates.

(2) Based on the aggregated estimates, which are preferable, the incidence of poverty in rural India declined from 58.8 per cent in 1970-71 to 50.8 per cent in 1983 and 48.7 per cent in 1987-88. In the urban sector, the corresponding decline in poverty incidence was from 46.2 per cent (1970-71) to 39.7 per cent (1983) and to 37.8 per cent (1987-88). For rural and urban India taken together, the incidence of poverty declined from 56.3 per cent in 1970-71 to 48.1 per cent in 1983 and further to 45.9 per cent in 1987-88. To put it differently, the annualised rate of decline in rural poverty incidence in India as a whole was steeper between 1970-71 and 1983 (1.2 per cent) than in the later period from 1983 to 1987-88 (0.9 per cent). In

the urban sector, the corresponding rate of decline was about 1.1 to 1.2 per cent per annum during both the periods.

(3) The absolute numbers of the rural poor (in million), on the other hand, rose from 257.9 (1970-71) to 276.8 (1983) and further to 283.7 million (1987-88). In urban India, the numbers of the poor rose from 50.4 (1970-71) to 69.2 (1983) and 77.5 million (1987-88).

(4) For the Indian union as a whole, the population in poverty grew from 308.1 million in 1970-71 to 346.0 million in 1983 and to 361.2 million in 1987-88. Incidentally, the total population of India was about 361 million in 1951, whereas the population of the poor alone was exactly of the same magnitude in 1987-88. The annualised rate of growth of the rural population afflicted with poverty was around 0.5 to 0.6 per cent between 1970-71 and 1983 as well as between 1983 and 1987-88. In sharp contrast, the corresponding rate of growth of urban population in poverty was about 2.5 to 2.6 per cent between 1970-71 and 1987-88. For India as a whole, the population of the poor grew at an annual rate of about 0.9 per cent between 1970-71 and 1987-88, which may be compared with the overall growth rate of the general population of around 2.2 per cent since 1971.

(5) In view of the very small size of the population of Manipur, Tripura and Delhi (rural), our discussion of state-specific results is better confined to the remaining 17 major states. Among these 17 states, the incidence of rural poverty in Punjab was consistently the lowest in the three years, being 28.7 per cent (1970-71), 18.5 per cent (1983) and 21.0 per cent (1987-88), whereas rural Bihar occupied the opposite pole in 1983 (70.4 per cent) and 1987-88 (66.3 per cent) and West Bengal in 1970-71 (76.7 per cent). One nevertheless must note that rural Punjab ranked very low in terms of its performance in poverty alleviation, as both the headcount ratio as well as the numbers of the rural poor rose between 1983 and 1987-88. In the urban sector, the lowest headcount ratio was observed for Himachal Pradesh in all the three years and no single state, on the other hand, occupied the worst position (highest incidence of poverty) consistently in all the three years. Since the weight of the rural sector in each of the major states is very large, Punjab and Bihar occupied the same extreme but opposite positions in regard to poverty incidence at the entire state level in all the three years, 1970-71, 1983 and 1987-88.

(6) Rural sector of Assam and the urban sector of Bihar had the unique but dubious distinction of registering increase in poverty incidence in 1987-88 in relation to their level of poverty incidence experienced in 1970-71 as well as 1983.

TABLE 8.R: RANKING OF STATES IN TERMS OF POVERTY ALLEVIATION PERFORMANCE, ANNUAL RATES OF GROWTH OF HEADCOUNT RATIO (h) AND NUMBERS OF THE POOR (n) DURING PERIODS I AND II—RURAL POPULATION

| Category (1) | Rank (2) | State (3) | h(Per Cent) | | n(Per Cent) | | Numbers of Poor (million) | | |

| B(ii) | 12 | KRN | -2.2 | 1.1 | -0.5 | 2.3 | 11.715 (4.60) | 10.981 (4.01) | 12.179 (4.34) |
| B(ii) | 13 | HP | -1.8 | 1.7 | 0.2 | 3.4 | 0.925 (0.36) | 0.947 (0.35) | 1.103 (0.40) |
| B(ii) | 14 | ASM | -0.2 | 1.7 | 2.6 | 3.9 | 6.716 (2.64) | 9.237 (3.38) | 10.953 (3.91) |
| B(ii) | 15 | PNB | -3.5 | 2.9 | -2.0 | 4.0 | 2.961 (1.16) | 2.311 (0.84) | 2.752 (0.98) |
| B(ii) | 16 | GJT | -3.6 | 3.0 | -1.8 | 4.5 | 11.089 (4.36) | 8.842 (3.23) | 10.771 (3.82) |
| C | 17 | J&K | 0.4 | 2.8 | 2.7 | 4.7 | 1.040 (0.42) | 1.442 (0.53) | 1.776 (0.64) |
| 17 States together | | | -1.2 | -0.9 | 0.6 | 0.6 | 254.475 (100.0) | 273.584 (100.0) | 280.474 (100.0) |

Notes: (1) I and II refer to periods 1970-71 to 1983 and 1983 to 1987-88.

(2) Figures within brackets refer to percentage share of a state in the total poor population of 17 states together in a given year.

(3) For explanation of the abbreviations used for state names, see Table 2.

(4) Column (1) refer to the state-specific category assigned while ranking the 17 states

Source: Table 5.

(7) Among the 17 states, Tamil Nadu, Madhya Pradesh and Uttar Pradesh experienced higher annualised rates of

decline in poverty incidence in period II (1983 to 1987-88) than in period I (1970-71 to 1983) both in the rural as well as

urban sector

(8) In the rural sector, the highest annualised rate of decline in poverty incidence was registered by Haryana (4.0 per cent) over period I and by West Bengal (3.1 per cent) over period II. In the urban sector, the highest rate of decline was experienced by Himachal Pradesh both in period I (7.5 per cent) and period II (15.6 per cent). In the second period, Punjab also registered an equally steep decline (13.6 per cent) in urban poverty. At the entire state level (rural plus urban), Haryana (4.0 per cent) recorded the highest annual rate of decline in poverty incidence during period I, whereas in period II, Tamil Nadu (2.6 per cent) and West Bengal (2.5 per cent) registered the highest rates of decline among the 17 states.

(9) Returning to the ranking of 17 states in terms of poverty alleviation performance, Andhra Pradesh and Kerala were the only two states which managed to reduce both the headcount ratio as well as the numbers of the poor consistently in both the periods in the rural sector, and thus secured the first and second ranks respectively. In the urban sector, it was only the state of Himachal Pradesh where both the headcount ratio and the numbers of the poor declined in both periods.

Finally, we must note that there is no basis, either in theory or known facts, to carry out a *pro rata* adjustment in the observed size distribution of consumer expenditure in a particular NSS round by multiplying it with a scalar derived from the ratio between the National Accounts estimate of aggregate consumption for the nearest financial year and the total NSS consumer expenditure available from the particular round of household budget survey. In spite of the weight of a substantial amount of scientific research to the contrary, the Planning Commission has continued to indulge in mindless tinkering with the NSS size distribution of consumer expenditure for 1987-88 also just as it did for 1983. The massive reduction in the incidence of poverty between 1983 and 1987-88, as reported by the Planning Commission in 1990, is largely a consequence of the peculiar statistical artefacts used by it and the extent of real reduction in poverty incidence is indeed rather small. Appropriately computed incidence of poverty in 1987-88 (affecting appropriate price adjustment only at the all-India level) comes to about 44.8 and 36.5 per cent, respectively in rural and urban India, rather than 32.7 and 19.4 per cent reported by the Planning Commission. However, according to our preferred aggregated all-India estimates (which allow for state-specific variation in prices relevant to the poor population in each state), the incidence of poverty in 1987-88 comes to about 48.7 and 37.8 per cent for all-India rural and urban, respectively.

TABLE 8U RANKING OF STATES IN TERMS OF POVERTY ALLEVIATION PERFORMANCE, ANNUAL RATES OF GROWTH OF HEADCOUNT RATIO (h) AND NUMBERS OF THE POOR (n) DURING PERIODS I AND II—URBAN POPULATION

Appendix

ESTIMATES OF HEADCOUNT RATIOS AT THE ALL-INDIA LEVEL USING THE PLANNING COMMISSION PROCEDURE

Planning Commission procedure for the estimation of the headcount ratio involves

(a) price-adjustment to the poverty line (originally estimated at 1973-74 prices) based on the implicit deflator for Aggregate Private Final Consumer Expenditure (PFCE) in the domestic market, and

(b) *pro rata* adjustment in the size distribution of PCFE for the difference between the National Accounts-based estimate of PCFE and the NSS-based estimate of Aggregate Household Consumer Expenditure (AHCE)

As regards (a), we have the following estimates of PFCE (Rs crore) at current and constant (1980-81) prices from the National Accounts Statistics (NAS)

| Year | PFCE at Current Prices | PFCE at Constant Prices |
|---------|------------------------|-------------------------|
| 1973-74 | 46618 | 75654 |
| 1987-88 | 223629 | 135320 |

The estimates for 1987-88 are the latest revised ones made available by CSO. Using the above information, the price-adjustment factor for 1987-88 (with 1973-74 = 100) works out to be 268.06

As regards (b), we have the following information for 1987-88. Average PCFE for all-India rural and urban population is Rs 158.10 and 249.93 per month respectively (Source: *NSS Draft Report No 372*, p. 17). Population weights derived from *Sarvekshana* (September 1990) p. 16 are 0.7395 (rural) and 0.2605 (urban) for 1987-88 with approximately 788 million of aggregate population. Since the NSS estimate is for 30 days, we use the factor of 12.167 (= 365/30) for deriving the annual estimate of AHCE. Using the foregoing information, NSS-based estimate of AHCE works out to

be Rs 174509 crore. The required *pro rata* adjustment factor for 1987-88, therefore, will be (PFCE based on NAS)/(AHCE based on NSS) = $223629/174509 = 1.275$

The alternative headcount ratios (in per cent) for 1987-88, based on the foregoing information of (a) and (b) and NSS based size-distribution (given in *NSS Draft Report No 372*), are as follows

| Sl. No. | HCR Estimation Procedure | Rural | Urban |
|---------|--|-------|-------|
| 1 | Using the price adjustment factor (a) and <i>pro rata</i> adjustment factor (b) | 29.33 | 17.57 |
| 2 | Using only the price adjustment factor (a) but not <i>pro rata</i> adjustment factor (b) | 51.00 | 33.47 |

Notes

1. The rationale for the choice of middle fractions of population as the relevant group, whose cost of living should be used in updating the poverty norms, is discussed in Minhas et al (1987)
2. For details, see Planning Commission (1979)
3. At the state and all India levels, the size distributions of PCFE in the years 1970-71, 1983 and 1987-88 are taken from the respective sources: *NSS Report No 231*, *Sarvekshana*, Vol IX, No 4, April 1986, and *NSS Draft Report No 372*, June (1990). Notice that the results relating to the year 1987-88 and reported in the *NSS Draft Report No 372* are based on the half sample. Nevertheless, the survey made large enough coverage in this half sample, with about 41.6 and 22.7 thousand households spread over about 4,184 sample villages and 2,298 sample blocks in the rural and urban areas respectively.

JUST PUBLISHED FOOD INSECURITY AND THE SOCIAL ENVIRONMENT Vol. I: FOOD SYSTEMS AND THE HUMAN ENVIRONMENT

by
BOUDHAYAN CHATTOPADHYAY

This work is the outcome of a thorough research in the Centre for Regional, Ecological and Science Studies in Development Alternatives. The first volume of the book (to be completed in two volumes) explores the profiles of food insecurity in Eastern India from the vantage point of the Bengal Famine of 1943, tracing out the vicissitudes of the food system through the post-Independence decades. Attention is particularly focussed on micro-community profiles of food insecurity including health hazards embedded in the tribe-caste land labour nexus. Attempt is made to combine a degree of sophistication of quantitative analysis with historical insights in which traditions and life style are also explicitly admitted. The second volume is in press.

Communists and Democracy in the Philippines

Olle Törnquist

In 1986, the 'national democratic movement' which constituted the main force of the revolutionary Left in Philippines calling for a boycott of the historic elections ordered by Marcos ran into a blind alley. Other cause oriented groups rallied behind Cory Aquino and in February, Marcos had to flee the country unable to face the upsurge of people's protests. The 'national democratic movement' seemed almost irrelevant and it had soon to admit that its boycott decision had been at least a 'major tactical blunder'.

While it is important to inquire why the boycott decision was taken and why the Left lost its initiative, this article explores why the radical Left failed to carry out materialist analyses towards a more fruitful and convincing understanding of political transformation in general, and in this case the growing importance of struggle for political democracy in particular within the framework of their basic theses.

[This article appears in two parts. This is the first part.]

I

Introduction

"GOD, WE MISSED OUT AGAIN!"¹

FOR many decades one of the most important political theses in the third world prescribed communist-guided political struggles in order to implement bourgeois revolutionary changes similar to the historical ones in Europe. Independent nation states should be created and foster agrarian reforms as well as industrial development. However, at least from the mid-sixties and onwards, this thesis was losing ground in Asia. The Indonesian communists were massacred. The Vietnamese won, but most of the other similar movements were forced to retreat. During the late-seventies and early-eighties the Philippines was actually one of the few countries in Asia where the revolutionary Left still expanded.

The so-called 'national democratic movement' ('democratic' in the sense of being anti-feudal) constituted the main force. It was led by a similarly labelled clandestine front, a new Maoist oriented Communist Party, and the rural based New People's Army.² The immediate target was the authoritarian and increasingly despotic regime of president Marcos, whose base was identified as imperialism and semi-feudalism. In 1983 the economic and political crisis of Marcos' state-led development was accentuated with the assassination of liberal ex-senator Benigno Aquino, the chief political opponent among the 'middle forces'. Many analysts spoke of an emerging revolutionary situation.

Were these expanding 'national democrats' about to show that the defeats for similar aspirations elsewhere in Asia were not caused by basic inadequacies in politically mainstream Marxism but were related to 'revisionism' and clumsy implementation, since it seemed to be possible to solve the problems by learning instead from Mao and insurrections in Latin America? Or was the Philippines an exception proving the rule?

Drawing on studies of the problems of the Left in Indonesia, and initial comparisons with India, I was at this time personally inclined to think that the Philippines I was told

about had only fallen behind—and that the radical opposition was already about to miss the train by boycotting the 1984 election, which was then on the agenda.³

The train did not depart in 1984. But as we know, a little more than one-and-a-half year: later, when president Marcos had to call for snap elections to verify his position, the strong and still expanding 'national democratic movement' ran into a blind alley by calling for another boycott of what was bound to be another sham-election, after which people were expected to realise that outright revolutionary struggle was the only real alternative.⁴

Most people and cause-oriented groups rallied instead behind Aquino in a massive attempt to win the elections. And when Marcos' manipulations and weakness became all too obvious in February 1986, the combined effect of vacillating US-support for the regime, defections within the military leadership, interventions of Cardinal Sin to create a miracle, and huge popular manifestations made at least Manila almost ungovernable. Marcos had to flee the country—while the 'national democratic movement' seemed almost irrelevant, and other sections of the radical Left were unable to step into his shoes.

A few months later even the 'national democratic' hard-liners had to admit that their boycott decision had been at least a 'major tactical blunder',⁵ while many others within the radical Left claimed that it was only the tip of an iceberg indicating more fundamental problems in predominant communist interpretations of Marxism.

A full explanation of why the Left lost the initiative in 1986 is of course beyond the scope of this essay. What I might be able to contribute is instead a study—based on my previous comparative studies of problems in applying Marxism in Indonesia and India, and on communication with some of those employing Marxism in the Philippines—of why it was difficult both to foresee, with the use of radical Left analyses, the rise of new essential contradictions, and to give priority to the issues related to political democracy which became so essential in early 1986.⁶

The answer to this question may be self-evident for those who maintain that com-

munist stand rooted to their analyses of socio-economic structures, programmatically neglect the issue of democracy, and cannot be expected to pay any interest in, or say anything enlightening about, state, government, and concrete politics. However, the Philippine 'national democrats' did not abstain from political studies. They were often sleight of hand with regard to concrete analyses of the political arena, tactics, manipulation, the possibilities of forming alliances etc and of adapting to the specificities of different localities.

The question may also seem unfair, since few if any of the well known actors involved fared much better in terms of actually predicting the growing importance of struggle for democracy in general and the 'EDSA revolution'⁷ in particular. But at the same time one should not forget, for instance, that the decisive boycott decision in the Communist Executive Committee was taken with only one vote's margin.⁸ And there were rather influential sections within the radical Left, including among the 'national democrats', who for many years had produced alternative perspectives.

It should, therefore, be fruitful to explore why it was difficult for various sections of the radical Left, including those who were critical of the very boycott decision, to carry out materialist analyses towards a more fruitful and convincing understanding of political transformation in general and, in this case, the growing importance of struggle for political democracy in particular, within the framework of their basic theses. It is of course also interesting to see if they have been able to do better since then.

FEATURES OF DEMOCRACY

We start by briefly defining democracy. It should thereafter be possible to discuss if and how its vital characteristics were paid attention to within the framework of radical Left analyses and strategies.

Maximum democracy may be conceptualised in terms of the actual capacity of the adult citizens to exercise in various forms equal and effective rule over resources which they hold in common without thereby undermining the absolutely necessary prerequisites for this rule.

The features which are especially important in a discussion about Communists and democracy in the Philippines include, firstly, their positions on what is meant by 'the actual capacity' of the citizens, or the minimum prerequisites for democratic rule. These include the usual basic rights to organise and express opinion, etc, but also such a degree of autonomy that the citizens are genuinely capable of, for instance, casting their vote in accordance with their opinion without having to adjust to the wishes of, for instance, their employer or landlord, totally dominant propaganda from certain candidates, or even an intervening national or foreign government and army.

The notion of 'citizen' indicates that we address the ruling of a country, and the idea of a Philippine nation state is so far no problem for the radical Left. But it is, secondly, worthwhile paying some interest to different views on the importance of government at various levels, including the very local tiers.

Thirdly, the ways in which the radical Left approached questions related to the 'exercise' of democratic rule 'in various forms' should also be observed. How were, for instance, peoples' participation, including co-operative efforts, in addition to representation, and the electoral and party system perceived?

Fourthly, 'equal effective rule' naturally has to do with the principle of one man one vote, which as such does not seem to have been a problem for the radical Left, even though the role of enlightened leaders was. Various views on efficiency problems, the capacity to implement what is decided, may also be identified.

A fifth and most important aspect is to what extent the "resources which they (the citizens) hold in common" are focused by the radical Left. This has to do with the extension of democracy. My definition of maximum democracy implies that democratic rule may be extended to the resources which are held in common within, for instance, trade and production.⁹ Radicals are usually eager to stress that under so-called bourgeois democracy many of the resources are excluded and governed by private owners, and that one can only, at best, talk about equal rule of some few and not too weighty political institutions. What were and are the positions of the radical Left. And to what extent did and do they pay attention to the many resources which are already formally publicly controlled and regulated but often non-democratically governed because of various forms of monopolistic practices?

Radical Left views on the what democracy is used for should, sixthly, also be considered. The phrase "without thereby undermining the absolutely necessary prerequisites for this rule" indicates, for instance, that the contents of a decision to limit certain citizens' right to vote would be undemocratic, but not necessarily a decision to hold down people's wages.

In addition to this, the more or less democratic character of various movements'

policies must be examined. My basic materialist assumption is that the best way to demonstrate if, for instance, demands for certain democratic rights are genuine or 'purely tactical' is to study the extent to which the movements apply them to achieve far reaching tangible aims as agrarian reforms or radical measures to create more jobs and better living conditions for the labourers. In other words, many actors may maintain that democracy is important as such, but their reliability may be doubted as long as it cannot be substantiated that basic democratic aims and means are instrumental for their basic goals.

How, then, were these six aspects of democracy approached within the important over-all analyses and strategies of the radical Left, and how credible were various claims for democratisation?

II

Mainstream 'National Democrats'

BACKGROUND AND BASIC THESES

Most of the movements in Asia with a 'national democratic' orientation grew out of the anti-colonial struggle, as for instance in China, Vietnam, and Indonesia. The movement in the Philippines, however, is mainly a product of student activists who turned against a 'revisionist' old party during a period of revolutionary optimism in the late-sixties and early-seventies, and managed to enclose some remnants of the old peasant based national-liberation army.

Thus, even though the third largest Communist Party in the world, the PKI in Indonesia, had just failed miserably and was almost eliminated, and the old Philippine Communist Party was on the retreat, students in Manila had instead become increasingly radical. It is illustrative that Jose Maria 'Joma' Sison, the Philippine Communist with responsibility for the contacts with Jakarta and one of the most important student leaders back home, had communicated mainly with those of the Indonesian leaders who had tried to introduce Maoist ideas.¹⁰

Moreover, as the Vietnamese revolution advanced and the Great Chinese Cultural Revolution was at its peak, Sison did very much the same as Jusuf Adjitorop, a member of the former Indonesian politburo and later on head of a delegation to China. They both employed old radical Maoist writings as blueprints when interpreting the historical development of their countries, reviewing previous communist policies, and outlining new political strategies.¹¹

From this point of view, the old PKP had betrayed the national and democratic revolution, especially through its downgrading of the struggle against so-called semi-feudalism in the rural areas. This had paved the way both for compromises with the regime, and attempts to grab power which were not based on the mobilisation of the majority of the population, the peasants.¹²

While most communists maintained that the Philippines was not yet fully independent and liberated from imperialism, a main difference was that Sison et al. were most eager to uphold the thesis that the power of the imperialists, the so-called compradors, and the bureaucrat-capitalists rested with the landlords.¹³

Neither the so-called national bourgeois forces, nor the small working class was strong enough to tackle those enemies.¹⁴ Any consistent attempt to promote real social change must instead be built on the contradiction between the landlords and the most numerous subordinated class in the country, the peasantry.

Those with good reasons to oppose imperialism, semi-feudalism, etc, could and would then rally behind a broad national democratic front. They could stage almost all forms of struggle, be it legal or illegal—as long as they served the interest of the 'national democratic' cause.¹⁵ But since a prerequisite for the most basic exploitation—the semi-feudal relationship—was private monopoly of land and the use of extra-economic force against poor peasants, the peasants had to resist this repression and enforce land reforms by way of armed struggle. A properly led peasant-based guerrilla movement would be able to initiate a prolonged people's war, liberate various areas, and, finally, encircle the comprador and bureaucrat-capitalist puppets in the cities.^{16 17}

Moreover, those who rallied behind the broad front were assumed to be interested in anti-imperialism and anti-feudalism, but their positions, as well as that of the peasants, were often vulnerable, making them potentially sensitive to compromises. It was therefore necessary that the project as a whole be led by a party with a programme that was based on the working class, since the working class interests could only be firmly approached after a consistent national democratic revolution.¹⁸

Accordingly, Joma Sison led a handful of activists set out to form the new Communist Party of the Philippines in early 1969.

Thereafter the young urban activists had to found or find a guerrilla army to lead. However, they themselves were approached by an equally young commander with the name of Bernabe 'Dante' Buscayno, an unusually well-educated son of a poor revolutionary tenant in Tarlac, Central Luzon. Dante was virtually born into the old Huk guerrilla movement, which fought feudal oppressors, the Japanese occupying force, and US-created puppet governments. He had become commander, responsible for education, and finally divorced the increasingly corrupt Huk-leadership. Dante and his group were thus not only experienced armed peasants, but also politically conscious revolutionaries with firm roots in the struggle for national liberation. They did not look for enlightened leaders but for alliances with workers, students and progressive liberals such as Benigno Aquino.¹⁹

Dante's group was transformed into the New Peoples Army in late March 1969. Dante also became a member of the highest organs of the new party. But during the following six year period he worked mainly in the mountain ranges, educating and organising guerrilla fronts all over the country—while Joma Sison was charged with the central ideological leadership on the basis of the theses outlined above. In 1976 Dante was arrested, followed, in 1977, by Sison. But the movements that they had created were solid enough to not only survive, but also expand swiftly and considerably during the increasingly despotic Marcos regime.

It is not difficult to understand that differences in the background, experiences, and perspectives of these two leaders created some personal and political friction, or that the 'intellectual leader' was in favour of a 'limited boycott' in 1986 and still holds on to Mao's ideas of an anti-feudal peasant uprising, while the 'armed peasant leader' propagated 'critical participation' and for sometime has made use of the new 'democratic space' to organise peasants and a most successful co-operative against the onslaught of capitalism.^{20 21 22}

DEMOCRACY OF MINOR IMPORTANCE

I shall now argue that while this background and these basic theses, which were still being applied in the mid eighties, did not prevent the 'national democrats' from applauding the increasingly widespread opposition to Marcos, it was quite natural for them to reject its preoccupation with peaceful democratic means, rights and rule, and to instead suggest boycott.²³

To begin with, democratic methods of changing the society were untenable according to the 'national democratic theses', since not even the minimum prerequisites for a democratic process were present. Most basic rights to organise and express opinion were lacking. Elections would not be clean and the propaganda resources were extremely unevenly distributed. Feudal remnants in particular prevented the majority of the citizens from casting their vote according to their real opinion. Washington would in any case never accept that progressive forces made substantial gains in the Philippines. All these preconditions for democracy must be fought for by confronting the ruling classes before democratic means could be relied upon. There was thus no need even to talk about such issues as the overwhelming problems that any progressive government would have in implementing its policies.

In a way Sison has summarised all this by saying that "we could invite the others for elections in our liberated areas and then see who would win."²⁴

At the same time, however, he did of course open up for questions as to whether there would be minimum democratic prerequisites also for "the others" in these areas. And even if the 'national democrats' were

eager to demand, for instance, basic civil and political rights, and presumably appreciated them as such, the actual implementation of these rights in order to reach long-term goals were, as we know, not instrumental within the framework of their strategy of armed struggle.

Moreover, the explicit theses about the need for enlightened leadership based on the 'national democratic' programme implied that democratic rights and rule often did not make sense for the movement itself. The limits of internal democracy is a history in itself. There has not even been a second congress of the party.²⁵ But also most attempts at building various frontal organisations and coalitions have failed because it was basic for the 'national democrats' to 'lead them'.²⁶

Finally, in addition to what we have already said about the 'national democrats' being reluctant to employ democratic means against the Marcos regime, it also followed from their theses that it was either unfruitful or simply not especially important to emphasise struggle for democratic rule. There were two main reasons for this.

First, if one wants to get rid of an authoritarian regime one must hit at its ultimate basis. The 'national democrats' conceptualised the existence of, for instance, undemocratic control of extensive public resources and means to regulate the economy, in terms of 'bureaucratic capitalists'. However these, and many others within the organs, of the state, did not, according to the 'national democrats', have a basis of their own which could be hit at by democratisation. The 'bureaucrat capitalists' relied instead on the more powerful imperialists, compradors, and landlords who controlled most of the resources in the society privately. And it was thus the latter's private control of especially land, and their backing in Washington, which had to be hit at by means of, of course, anti imperialism and anti-feudalism since they, the big private owners, would not be especially threatened by political democracy.

This first argument in particular was no exclusive property of the Philippine 'national democrats'. It played a similarly decisive role for instance within the Left in Indonesia and India.

Secondly, if one wants to introduce a democratic system which is not exclusively useful for the traditional elite, the basic preconditions which we have already discussed must exist from the beginning. According to the 'national democrats', most of the essential prerequisites cannot simply be proclaimed and democratisation of public regulation and resources would not help much since most of the resources in the society are privately controlled. What is instead required is the uprooting of landlordism, etc. Otherwise democracy would not mean much for the people.

What happened in the early 1986 was thus almost impossible, according to the mainstream 'national democratic' theses.

Despite the lack of solid prerequisites for a democratic process, huge masses of people had been able to use and create some democratic rights and peaceful means which proved powerful. Demands for democratic control of public regulation and resources actually became the main issue which engaged huge masses of the people and undermined the regime. Large sections of the bourgeois forces were obviously not so retarded by, or linked up with, imperialism and 'semi-feudalism' that they could not actively contribute to democratic changes. Even Washington finally supported the changes.

III Challenges

The 'national democratic' theses were, of course, questioned from within the movement itself as well as by left-dissidents, even if it was an uphill task politically to challenge perspectives which, at least until early 1986, had seemed to be quite rewarding. My argument is, however, that while many critics emphasised the lack of democracy within the 'national democratic' movement, and some of them suggested alternative tactics which would include, for instance, participation in elections, no primary, long-term interest in the issues of democracy followed from any of the contending approaches.

RADICAL NATIONALISM

To begin with, many scholars and leaders related to the old Communist Party had self critically examined previous negative attitudes towards participation in the electoral processes. Extensive rigging of elections during the forties, and measures to prevent those radical leaders who nevertheless were elected from taking their seats, had contributed to a Communist boycott decision in the early fifties. The state of partial civil war at the time of the 1951 elections made it impossible for the party to participate openly.²⁷ But according to former general secretary Jesus Lava, it would have been possible to support the best of the other candidates. He also claims that it was wrong to assume people to be uninterested in elections only because they were against fraud. There were successful attempts, supported by Washington, to hold fair elections, but the radical Left distanced itself and lost out, almost like in 1984 and 1986. Lava concludes, however, by asserting that one shall, of course, be ready to boycott elections when people are prepared to take up revolutionary work.²⁸

Further, as I have already indicated in the former section it is also true that many scholars and leaders with some relation to the old party had long since questioned the 'national democratic' thesis of 'semi-feudal' oppression and exploitation as the main basis of imperialism in the Philippines. Had not, for instance, even the Americans been eager to introduce land reforms?²⁹ On the one

band this implied that armed anti-feudal struggles against extra-economic oppression was not as primary and mandatory as for the 'national democrats'. But on the other hand, the main enemy was then imperialism itself. The Philippines was simply not yet fully independent. Nothing serious took place in the country without the direct or indirect involvement of Washington, the Monetary Fund and so on. All patriots, democrats or not, must therefore fight against imperialism with all possible means. Struggle in democratic forms for democratic rights and rule would have to wait since one of the most basic preconditions—true national independence—was (and is) not yet attained.³⁰

Politics of Mode of Production

The questioning of the 'national democratic' thesis on the primary need to fight 'semi-feudalism' continued during the late-seventies and early-eighties within the framework of a Philippine version of an international discourse in vogue on modes of production.³¹ While this was often most abstract and formalistic, the political implications were less convoluted.

Lava et al, had arrived at a radical nationalist position. Those inspired by the neo-Marxist Latin American and African dependency school emphasised later on the spread of an underdeveloping capitalism.³² The peasants were present, but sharecropping and similar forms of tenancy relations were on the retreat. Rural and urban labour as well as other subordinated groups became increasingly important. 'Semi-feudalism' was no longer there. The bourgeois forces acted instead within the framework of 'dependent capitalism'. This called for broad popular struggles with socialist perspectives. The only alternative development path was authoritarian state-led economic growth. But Marcos was about to fail in his attempt.³³

Many of the scholars and activists attracted by these perspectives had hard personal experiences from authoritarian practices related to the old as well as new Communist Party. Other sympathisers had a background among social democratic and often Christian groups. It was thus natural to demand democratic rights and rule within and among the radical movements themselves. Still others were engaged in voluntary action and development groups which they claimed were indispensable to a democratic system that was not only for the elite, and which should also include people's participation in addition to their representation.³⁴ Moreover, such groups would not be able to exist without rather extensive civil liberties. Given the background of many of those attracted by neo-Marxist perspectives and the special character of the cause-oriented groups, it was, finally, natural to consider the possibilities of employing efficient non-violent forms of struggle.³⁵

The neo-Marxists were initially preoccupied with validating the expansion of

capitalism and underdevelopment. Much of the general democratic orientation and preferences among many neo-Marxists thus lacked a powerful theoretical and analytical foundation.

Later on, as the increasing importance of the state in third world development became more and more obvious, neo-Marxists in most countries tried to go beyond previous mechanical and economic perspectives. In Philippine seminar rooms scholars began to talk about "the relative autonomy of the state".³⁶ All political structures and transformations were not directly determined by the basic class forces. There was some room for political manoeuvring without first having to take over state power.

To the extent that such insights had some political importance³⁷ they did, of course, allow for more careful analyses. But it is important to remember that the thesis about a special degree of 'relative autonomy' in the third world was mainly substantiated by a common inability of any of the dominating classes to develop as the ruling force, and by extensive formerly colonial state institutions.³⁸ From this point of view it was the balance of class forces that was vital, rather than questions related to the monopolisation of public regulation and resources. American colonial rule had moreover been quite different from, for instance, Dutch or British. Inherited state apparatuses were thus less important than in Indonesia or India.³⁹

Issues related to demands for democratic rule of the state and its resources were therefore not on top of the agenda, which was instead dominated by discussions on how to supplement basic struggles against the dominating classes by also fighting for positions in the arena and within institutions that were 'relatively autonomous'. Decisions among the neo-Marxists to first boycott the elections in 1984 but then to go for critical participation in 1986 seem to have been based mainly on analyses of the political conjuncture, including the possibility of uniting as many people as possible against the regime—in addition to studies of to what extent reasonable preconditions for a democratic process were available or at least could be fought for. Struggle with democratic means for democratic ends was not considered a reliable alternative. Military interventions was expected to be unavoidable.⁴⁰

Within the mainstream 'national democrats' the predominant reaction to the challenges may very well have been that the grassroots downgraded the importance of their over-all theses and adapted their concrete tactics to complicated and highly different contradictions in various regions and sectors. But in addition to this, some leading "national-democratic" scholars took upon themselves to defend and further develop the old perspective in face of those rejecting the notion of 'semi-feudalism', etc.

These 'national democratic' scholars apply an extremely narrow definition of capitalism, and thereafter invite all the new

transformations which thus, are not pure capitalist, to take shelter under the old umbrella of "semi-feudalism", thereby helping to confirm the orthodoxy.

According to Ricardo Ferrer the essence of capitalism is that "the mechanism of reproducing property rights over means of production is the intervention at the level of economy via accumulation and/or innovation."⁴¹ Markets are present in the Philippines, generalised commodity production is, and capital-wage labour relations are there. But the capitalists are not productive. Moreover, a lot of extra-economic force is made use of, and various rents are extracted. Ferrer even maintains that feudal laws of motion are decisive within the framework of western monopoly-capitalism.⁴²

The main political implication is, of course, that the basic thesis of the 'national democrats' is still valid. But does not Ferrer's emphasis on extra-economic forces, monopolised control of regulation and essential conditions of production, the extraction of rents, etc, make struggle for political democracy especially important?

Basically his answer is negative. The main reason for these factors is the predominance of feudal laws of motion, which must still be fought against by the oppressed, through broad alliances with so-called progressive capitalists and farmers (who are, unfortunately, difficult to separate from the bad guys).⁴³

When challenged by my alternative conclusion that "feudal remnants" have proved decisive for the rapid expansion of capitalism in, for instance, Indonesia—implying a strategy of anti-monopolism through democratisation, rather than anti-feudalism in favour of capitalism⁴⁴—Ferrer doubts that it is capitalist laws of motion which are at work. He also adds that in any case those who monopolise public regulation and resources have no base of their own which can be fruitfully undermined by democratisation. As usual one must instead hit at their "real" foundation among the powerful landlords and private capitalists.⁴⁵

'NATIONAL DEMOCRATIC' DISSIDENTS

Serious disagreements were also present within the mainstream 'national democratic' movement. As the popular opposition against Marcos increased in the mid-seventies, many young and often intellectual leading members of the Manila-Rizal party committee suggested that they should not have to wait for the rural revolution to unfold before they themselves staged urban offensives.⁴⁶

The extent to which this perspective was inspired by neo-Marxist arguments about capitalist expansion is an open question. The committee members were of course more eager to situate themselves within the framework of the mainstream movement even referring to recommendations from Sison for decentralised operations in accordance with the local situation. Viewed thus,

the best thing to do in the central urban area was to stimulate and influence the broad opposition movement against Marcos' dictatorship

It was instead the way in which the Manila-Rizal cadres went about doing this that brought them into sharp conflicts with the highest party organs. The Manila-Rizal leaders gave priority to broad 'anti-fascist' struggle for democratisation against Marcos' dictatorship. They claimed that the democratic rights and means which were present or could be developed, including the electoral process, should be used as long as possible, despite the fact that many decisive preconditions for a democratic polity were lacking. As elections were due in 1978, the Manila-Rizal activists thus entered into agreements with other leftists and liberals, including the Aquinos, proposed critical participation in the electoral processes, and even spoke about the possibility of thereby getting rid of Marcos.

The orthodox central leaders, including Sison, maintained, of course, that the Manila Rizal committee settled for 'right opportunist' policies, helped legitimise Marcos rule, and created illusions about how one could change the society.⁴⁷ The accent on broad urban 'anti fascist' struggles departed from the necessary emphasis on rural based armed struggles against feudalism and imperialism.

A last minute straightforward order from the party leaders to instead boycott the elections was finally neglected by the Manila dissidents. The extent to which this dispute contributed to the miserable results is impossible to say. The elections were in any case efficiently rigged. The progressive front did not make any gains. Some thousands of Manilans protested but no huge masses of angry people took to the streets in order to form their own parliaments, and mainstream 'national democrats' who claimed that they had been vindicated set out to purge their opponents.

While it was thus obvious that struggle for democratisation by peaceful and democratic means made sense for the Manila-Rizal leaders in a short term perspective, these considerations were hardly based on alternative conceptualisations making the issue of democracy instrumental to reaching long term aims. The Manila Rizal committee emphasised 'anti fascism' but did not really negate the basic importance of struggle against 'feudalism' and imperialism. Their argument was rather that the best way for the 'national democrats' to reach out to wide sections of the population with such revolutionary propaganda was to participate in joint mass campaigns. As people gained their own bitter experiences they would be prepared to listen to the 'national democrats'. There was also an opportunity to divide the ruling elite by keeping the channels open to those against Marcos. And it should be possible to mobilise moral and material support for the rural armed forces through contacts with dissatisfied ad-

ministrators, politicians, and businessmen. In addition to this it is interesting to note that in an internal trial against the Manila-Rizal activists after 1978 the party-leadership employed the writings of Mao, while the dissidents made frequent use of what Lenin and Stalin had said about the need to apply efficient tactics and make use of all means in order to mobilise and organise people before the time was right for a revolution.

From discussions with scholars with good knowledge about these debates, as well as with Sison, my own conclusion is that much of the alliances and policies suggested by the Manila-Rizal committee would have been quite all-right if 'only' the party had been in a guiding position and the 'national democratic' perspective had been imposed as a framework.⁴⁸ In the face of the 1984 elections the party leadership entered for instance, into alliances with similarly moderate forces—with conditions enabling 'national democratic' cadres and sympathisers to enforce a boycott decision.⁴⁹ And only when the leaders later on failed in doing the same within the framework of the previously managed coalition called 'Bayan', was it natural to take a principled stand in 1986.

The party leadership was able to limit the direct effects of the controversies in the late-seventies to Greater Manila and to purge those directly involved. But the critical perspectives survived and developed in two directions: one emphasising insurrectionist perspectives, another stressing so-called popular democracy.

In the late-seventies and early eighties the 'national democrats' and their New People's Army expanded drastically in the south, in Mindanao.⁵⁰ Reckless penetration of capitalism within fishing, timber, shipping, and agri-business had generated drastic socio-economic changes. Many people in rural areas had been uprooted and now spent parts of their lives as migrant labourers or trying to find jobs in the urban areas. The guerrilla units followed suit and their armed actions spread to the cities. Leaders of the National Democratic Front were also able to stimulate and influence many of the various cause oriented groups, not least during the boycott of the 1981 elections and in the rapidly growing city of Davao with its huge slum areas.⁵¹

This movement gained further momentum by hanging on to the broad popular protests after the assassination of Ninoy Aquino in August 1983. The leaders saw a revolutionary situation emerging, in which it should be possible to combine rural and urban struggles with the eruption taking place in the cities. This thus ran counter to much of the orthodox 'national democratic' theses inspired by Maoism. Some inspiration came instead from the successful Left in Nicaragua and the experiences in El Salvador. In late 1983 and early 1984 the Mindanao leaders suggested in vain that the "national democratic" movement as a whole should consider a fast track to power by applying an insurrectionist perspective.⁵² Back

in Mindanao they were however able to develop successful so-called people strikes, *weigang bayan*.

The concept of 'peoples' strikes' was an attempt to go beyond the traditional workers' strikes with roots in industrialised societies. The many people in third world countries who work within administration and education as well as within more of less 'informal' transportation, service, trading etc, could add their form of work stoppages such as blocking roads and participating in demonstrations and rallies etc, and to paralyse the government.

To some extent 'peoples' strikes' were successfully adopted also by other party organisations in the country. The 'insurrectionist' perspective had become one of the major oppositional tendencies within the 'national democratic' movement. However, in Mindanao in general and Davao in particular the tense situation, especially in urban slum-areas, eventually got out of hand as attempts to supplement the co-ordinated protests and work stoppages with armed actions developed into uncontrolled killings. This slowly came to an end in 1985 when a new and highly professional Marine Colonel was able to stabilise the situation by mixing the selective enforcement of law and order with the addressing of certain problems that people had revolted against.⁵³

Meanwhile the 'national democrats' had to concentrate on what was happening in Manila, including Marcos' snap elections. To what extent then did democracy make sense for the 'insurrectionist' tendency?

Obviously the 'insurrectionists' suggested 'critical participation' in the elections. A precondition for the expansion of the revolutionary forces in Mindanao had been their ability to associate with the broad popular opposition against Marcos. But the main criterion in deciding what methods to use was clearly the extent to which they would contribute to a successful insurgency. This could generate a dual sharing of power between the moderate progressives and the revolutionary forces. The latter would finally win since they should be able to paralyse the ruling of the country, reminiscent of events in Russia. Struggle for democratic rights—by making use of whatever freedoms that were already there, or could be created—did thus make sense in a short-term perspective in order to pave the way for more drastic methods to grab state power. From the insurrectional point of view, the central party leadership took its devastating boycott decision because its preoccupation with a Maoist protracted people's war prevented it from foreseeing the ripening of an urban revolutionary situation. Accordingly, the 'EDSA revolution' was a lost insurrectionists opportunity.⁵⁴

However, one should also discuss the extent to which the concept of 'peoples' strike' was based on ideas of local popular rule and co-operative efforts in, for instance, neighbourhoods. Within the Latin American discourse about radical transformation such

efforts have at least gained some importance.⁵¹ In the Philippines on the other hand, this was hardly touched upon by a leading ideologue like Villalobos, despite frequent references to Latin American experiences. Neither does it seem to have been solidly practised in, for instance, the Davao slum areas where the killings took serious proportions and people rapidly changed loyalties. The foremost 'national democratic' stronghold of Agalao even became a hotbed of anti-communist vigilantes in 1986.⁵² And the abortive attempts at introducing 'peoples' strikes' in Manila by drawing on small groups of activists hardly indicate a special interest in introducing popular rule and co-operative efforts in various districts and sectors.

On the contrary, the 'insurrectionists' simply developed the art of political manoeuvring and the grabbing of state power in a given revolutionary situation, without relying too much on social theories and analyses of fundamental driving forces—perspectives which in turn would have made it possible and relevant to discuss if aims like democratic rights and rule made sense, or at least to consider when and how revolutionary situations could emerge (and disappear).

As I have already hinted at the Maoist inspired communist theses adopted in the Philippines prescribed an anti imperialist anti-feudal revolution which would be led by The Party but be based on common interests among the workers, the peasants and the so-called national, as well as petty bourgeoisie. When the new Communist Party and the New People's Army had been consolidated in the mid seventies it was thus time to initiate a multi class National Democratic Front (NDF) under Communist hegemony.⁵³

For obvious reasons these classes did not automatically appear and the various organisations which more or less represented their aspirations were not particularly eager to enrol themselves under Communist rule, unless they were not already domesticated or initiated by the Communists.

In the late seventies the united front programme was therefore more attractively designed. It was, for instance, stated that nationalistic private businessmen would have nothing to fear and that all patriots would be granted democratic rights under a national democratic coalition government. As we know, the dissident Manila Rizal party committee even managed to initiate close co-operation with progressive centrist forces in face of the 1978 elections. But as we also know, this project was effectively blocked by the orthodox party leadership.

Actually, it was only in 1980 that a party authorised dynamic attempt was made to develop efficient united front work. The propelling force with excellent contacts was Horacio 'Boy' Morales, a celebrated former executive secretary under Marcos and head of his prestigious Development Academy, who had defected when he was to be award

ed as one of the 'ten outstanding young men' in late 1977. Another, though in exile after five years of detention, was Father Ed de la Torre, who was inspired by Latin American 'liberation theology', had initiated the militant "Christians for National Liberation" and had participated in the first attempts to build the NDF.

On the one hand, NDF was solidly anchored by Morales et al within the 'national democratic' movement. Its decisive leaders were included in a co-ordinating committee. The New People's Army was relieved from much of its political work and the NDF took responsibility for local organisation and action by synchronising the activities of various so called sectoral organisations of the workers, peasants, women, etc. Morales suggested moreover that the 1981 presidential elections should be boycotted.

On the other hand the new NDF leadership also tried to open up the Front for others, despite the fact that party leaders still demanded that those joining must accept all the basic national democratic theses. This proved difficult and priority was given to extensive contacts and joint actions with independent organisations and most influential opponents of Marcos' authoritarian regime—leftists as well as liberals or simply nationalists. This paved the way for broad political alliances and successful campaigns influenced by the NDF against the Marcos regime and its attempts to gain some legitimacy.

But Morales was arrested in 1982 (as was de la Torre upon his return from exile) and the promising start slowly came to an end. The NDF was subordinated to orthodox party leaders. When huge masses of people staged frequent angry demonstrations and formed more and more oppositional cause oriented groups after the assassination of Ninoy Aquino the national democrats definitely tried to hang along. And flexible writings came from the detained Sison. But generally speaking the national democrats were once again eager to force their perspective upon others.

Inside prison Morales and de la Torre were able to exchange views with certain other prominent radicals including the dissident revolutionary Nemesio Prudente and the leading socialist Marianito Canonigo. Morales' and Torres' previous attempts at trying to develop a framework for broad coalitions thus continued while a new and extended perspective was labelled 'popular democracy'. Their prison study circle produced a series of *Plaridel Papers* and the ideas gained some influence among the various contenting oppositional forces including the Aquinos.⁵⁴

An important first step was to set aside some of the differences between for instance armed national democrats' socialists and liberals which were simply imagined or only important in a long term strategical perspective—and to identify instead what conflicts between the political groups that prevented efficient united action

under the present concrete circumstances, against Marcos' authoritarian regime, and for a trustworthy government.

A major argument was that the basic actual conflict had to do with the sort of democracy that should replace the dictatorship. Restoration of the previous 'elite democracy' with more or less 'peaceful alternation of various factions of the elite in holding government power' stood against varying attempts to give people a real choice between many parties and projects, or popular democracy.⁵⁵

Despite the fact that the 'popular democrats' emphasised 'anti fascism', their concept of 'popular democracy' was intended to be different from the Communist led so called popular fronts 'from below' in Europe during the thirties and forties.⁵⁶ Nor was it identical with the notion of 'people's democracy', which indicated the dominant rule of many classes (rather than, for instance proletarian or bourgeois hegemony).⁵⁷ Popular democracy implied something more the importance of autonomous organisations in addition to parties state and government and participation in addition to representation making pluralism essential.⁵⁸

According to the popular democrats three different political lines were contending for influence over the protest movement in the mid eighties: those emphasising pressure politics through enhanced protests; those suggesting that there was also a need for elections; and those saying that in addition to pressure and elections there was a decisive need for armed uprisings. The vital question was thus: how could these efforts converge and effectively get rid of Marcos' authoritarianism while at the same time the attempts to build popular democracy were enhanced?⁵⁹

Firstly already the united front work must be characterised by popular democratic principles. There should for instance be parties and leaders representing different class interests as well as groups or councils with people who themselves participated in the transformation of the society. These actors should be autonomous, treat each other with mutual respect and gain influence according to the balance of forces both in terms of organisational capacity and in terms of being able to mobilise broad popular support. The attempt to form a broad coalition of centrist and left oriented forces against Marcos with the name of 'Bayan' was a month before the devastating formal founding congress seen as a step in the right direction.⁶⁰

Secondly—and this was stated in early 1985—elections must be turned into the tactical focus. This was compatible with all the three political lines with no one having to give up. Those, for instance in favour of pressure politics could simply add elections, while the armed national democrats could, for a certain period of time, stress one of the minor components of their comprehensive strategy: elections.⁶¹ Moreover, those

who wanted to go beyond the restoration of elite democracy could thereby (a) prevent attempts to isolate the radical Left (by first provoking a boycott-decision and then invest in reasonably clean elections)⁶⁸, (b) strengthen the alliance between the 'middle and the left', (c) enhance the bargaining power of the radicals vis-à-vis the traditional elite, and (c) allow people themselves, including those who supported the traditional opposition, to learn from their own political experiences and later on favour more radical policies.⁶⁹

It is thus obvious that many decisive features of democracy made sense for at least one 'national democratic' tendency before the 'EDSA revolution'.⁷⁰ Many minimum prerequisites for democracy did not exist and in some cases elections had to be boycotted, but there were also ample opportunities to use existing liberties to fight for more democratic rights.

Similar statements had been made by the 1978 Manila-Rizal dissidents. But the 'popular democrats' had more to say in a slightly different political situation: autonomous organisations and people's participation in addition to representation were most important, there should be a multi-party system, and pluralism should characterise relations within the Left as well. On the other hand, the 'popular democrats' paid little interest to the potential importance of struggle for democratising the ruling of public resources. This may be related to the lack of analyses of how resources in general were controlled. They had consciously abstained from tackling long term perspectives and basic analyses of driving social forces, since this might have blurred the more urgent 'anti fascist' unity.

Moreover, various democratic rights and certain forms of rule were definitely instrumental in developing appropriate frameworks for popular coalitions: co-operation, participation, checks and balances, etc. But aside from identifying movements that might give tactical emphasis to elections, the 'popular democratic' analyses were not comprehensive and deep enough to say much, if anything, about what social forces that could be genuinely interested in enforcing the attractive democratic framework in a longer perspective.

(To be Concluded)

Notes

- 1 The leader of the Christians for National Liberation, Father Edicio de la Torre, upon his release from detention after the coming to presidential power of Aquino in February 1986, quoted from Alex Magno 'CPP: Rethinking the Revolutionary Process' in *Diliman Review*, Vol 34, No 4, p 18.
- 2 The Communist Party of the Philippines (CPP) was formed by members of the old Philippine Communist Party (PKP) which had compromised with Marcos, and student activists, and was founded in early 1969 (officially, however, on Mao's birthday, December 28, 1968), as was the New

Peoples Army (NPA) which initially was based on members of the Huk guerrilla movement who divorced an increasingly corrupt commander. The National Democratic Front (NDF) was initiated in 1973 and formally established in 1980.

- 3 Having disputed this with the Nemenzus in Canberra late in the evening of May 1 1984, they not only held on to their hospitality but also suggested that I should try to study the issue more carefully by including the Philippines in my comparative project. Therefore, whatever merits this essay may have initially rest with them—as well as with all the others, both within and outside of the Philippines, who have been kind enough to share their analyses with me. However, I remain of course solely responsible for all the shortcomings. The research has been funded by Uppsala University, the Bank of Sweden Tercentenary Foundation, and Swedish Council for Research in the Humanities and Social Sciences.
- 4 See the editorial statement of *Ang Bayan* (official publication of the Communist Party of the Philippines) January 15, 1986 and *Liberation* (Published by the National Democratic Front), Vol XIV, No 1, 1986.
- 5 *Ang Bayan* Vol XVIII, No 3 May 1986, pp 13.
- 6 I am thus, relying primarily on interviews with scholars in the field and some of the concerned analysts and ideologues who from their respective points of view have also been asked to suggest sources and literature on key issues which I have then tried to supplement. Comparative points of departure are found in my *Dilemmas of Third World Communism: The Destruction of the PKI in Indonesia* (London: Zed Books, 1984), *What's Wrong with Marxism: On Capitalists and State in India and Indonesia* (New Delhi: Manohar Publications 1989), *What's Wrong with Marxism: Volume 2: On Peasants and Workers in India and Indonesia* (New Delhi: Manohar Publications 1990), and *Communists and Democracy: Two Indian Cases and One Debate* in *Bulletin of Concerned Asian Scholars* Vol 23 1, 1991 (forthcoming).
- 7 The Metro Manila circular road which is usually called EDSA has given name to the gigantic popular manifestation which in February 22 1986 brought Cora on Aquino to the presidency. On February 22 several thousands, and between February 23 and 25 more than one and some say close to two million people, blocked the avenue first at Camp Aguinaldo (the defence ministry headquarters) and then Camp Crame (the national police headquarters) preventing Marcos from using his troops against dissident military leaders.
- 8 Alex Magno 'CPP: Rethinking' op cit p 11 and Gregg R Jones *Red Revolution: Inside the Philippine Guerrilla Movement* (Westview Press 1989) p 157.
- 9 Allow me to state in order to avoid possible misunderstandings that the fact that maximum democracy in the sense that it is extended to all resources which the citizen hold in common may be economically devastating is quite something else: democracy does not solve all problems.
- 10 Interview with the former general secretary of the PKP Jesus Lava March 14 1990 and with Jomari Sison May 5 1990.
- 11 See for instance: Amando Guerrero (Jose Mari Sison) *Philippine Society and Revolution* (Hongkong: La Kung Pan 1971) and *Build the PKI along the Marxist-Leninist Line to Lead the People's*

Democratic Revolution in Indonesia (The delegation of the CCPKI, 1971) (The Indonesian attempts in this direction ran aground in 1968.) I am also thankful for discussions with among others, Ricardo Dick Malay (the former vice chairman of the CPP delegation to China, March 16, 1990). When nothing else is stated below, I am drawing on *The Philippine Society and Revolution*.

- 12 See for instance *Report to the Central Committee on Lavoite Propaganda for Revisionism and Fascism* (Pulang Tala, 1971). I am also drawing on Jesus Lava's own version, supplemented by that of the former PKP and Huk leader Casto Alejandro interviews, January 19 and March 14, 1990.
- 13 I hesitate to refer to the definitions, which, in any case follow the Maoist formula. See especially Guerrero *The Philippine Society* op cit pp 204-24 on bureaucrat capitalism, and ch 3 section 2 on 'Classes in the Philippine Society'. Allow me however, to stress, as in my previously mentioned analyses of the problems in Indonesia and India, that the 'bureaucrat capitalists' were not assumed to constitute a class or even a faction with a basis of its own, but mainly indicate those capitalists or landlords—but also bureaucrats, officers, and politicians drawing on the class basis of, for instance, capitalists—who utilised the state in order to promote themselves as capitalists. As we shall see later I believe this was one of the major factors which paved the way for the lack of interest in democracy among the national democrats.
- 14 The Philippine analysts were no more successful in specifying this problematic concept than those within the Indonesian or Indian Left. Guerrero (Sison) made his best out of what Mao had stated, see Guerrero *Philippine Society* op cit p 241ff. As usual the attempts at applying economic distinctions related to 'nationalist industrialisation' or capitalist relations of production in the country' (p 241) are insufficient and still lead—in the final analysis and when one presses political economists such as Ricardo 'Dick' Guerrero related to the national democrats—to classifications based on various capitalist views on the political lines of different organisations. Interview March 21 1990.
- 15 The limits were, of course, difficult to identify. This opened up for skilful political manoeuvring. Sison himself was (and is) dogmatic with regard to the basic theses.

but very open to most actions by different actors and movements as long as they do not challenge the leading role and ideology of the 'national democrats', and during the early and mid eighties he criticised so-called sectarian positions among the 'national democrats'. Discussions and interviews with Sison (February and October 1987 and May 1990) as well as with dissidents who opposed the boycott decision (May 1990), cf. also what Sison had to say as late as in January 1986, *Midweek*, January 15-22, 1986

- 16 These ideas of initiating a popular uprising presume that a lot of people would follow suit when the oppressive forces in a village or an area had been undermined or 'eliminated'. Interestingly enough however, the discussions about the possibilities of igniting the spark seems to have been rare and the existence of at least potential revolutionary situations taken almost for granted. One of the scholars in the field, Armando 'Buddy' Malay Jr, even suggests certain similarities with the Latin American 'foco strategy' of generating mass support by armed actions (Interview March 19, 1990) (Cf also his 'Some random reflections on Marxism and Maoism in the Philippines' in *Marxism in the Philippines—Marx Centennial Lectures*, (Quezon City Third World Studies Centre, University of the Philippines, 1984). When pressed on this point ("How do you know that there is a revolutionary situation?") Sison could only offer rough indicators such as an inability of the government to rule the country, grave oppression of the people etc. (Interview May 3, 1990). This is reminiscent of the problems experienced by the so called Naxalites in India, see the second volume of my *What's Wrong with Marxism?*, ch 3 (At least at present, the guerrilla leader Dante takes quite another stand to which I shall return below)
- 17 When later on the liberation of Saigon took place it seems to have been a good illustration of what the 'national democrats' would like to think could happen also in the Philippines
- 18 See e.g. Guerrero, *The Philippine Society*, op cit, pp 276-86
- 19 I draw on William Chapman, *Inside the Philippine Revolution* (London: I B Tauris

- and Co, 1988, pp 64-67 and 78f, Jones, *Red Revolution*, op cit, p 26ff, and Francisco Nemenzo 'An Irrepressible Revolution: The Decline and Resurgence of the Philippine Communist Movement' (Manuscript, no date—mid-eighties), p 54ff, as well as on interviews with Dante, January 1 and May 25-26, 1990 (With regard to Dante and the Aquinos: While Dante led impoverished peasants who in protest against appalling conditions put fire to the adjacent sugarcane fields at the hacienda Luisita, young lady Corazon grew up in the saloons of the mansion among landlords and businessmen, including one who was to become a real favourite of Marcos. But Cory married a son at the hacienda in Concepcion, not far away. He was Benigno 'Ninoy' Aquino and grew up to be a radical liberal politician who saw Marcos as the main enemy, and who developed close relations with popular leaders in Tarlac such as Dante. I shall return to later parts of this story)
- 20 Two illustrations only, to avoid further gossiping. "Dante is good at minor tactics, not strategical" (Interview May 5, 1990) and "Sison was a good interpreter and compiler of books from whom I never got anything practical and who was a bit of an adventurer" (Interviews May 25 26 1990)
 - 21 Interviews, May 5 and 6, 1990
 - 22 I shall return below to Dante's present project
 - 23 I am thankful for comments on preliminary versions of the following interpretations from Armando 'Buddy' Malay Jr, March 19, 1990 and Sison, May 5 1990
 - 24 Interview with Sison, May 5, 1990
 - 25 When I think about the fact that the devastating boycott decision was not even taken by the politburo but in a 3:2 vote by the executive committee, or contemplate a plausible and serious decision in 1971 which may not have been taken by any organ at all I cannot but remember the way in which some of the leading members of the PKI in Indonesia seemed, in a similar fashion, to have handled the more or less provocative information that coup attempts were on their way in October 1965. See Olle Tornquist, *Dilemmas* op cit, Ch 18
 - 26 Cf. P N Abinales, 'The Left and Other

Forces: The Nature and Dynamics of pre-1986 Coalition Politics', in *Marxism in the Philippines. Second Series*, (Quezon City Third World Studies Centre, University of the Philippines, 1988). This caused, for instance, the attempts in the early-eighties, by Horacio 'Boy' Morales, et al, to broaden the National Democratic Front to run aground. (I shall return to this later on when discussing the so-called popular democrats), and turned *Bayan*, a legal coalition of radical cause oriented groups, into an almost exclusive 'nat dem', set-up already at its founding congress, not to talk about the state of affairs when the boycott decision had been enforced (Interview with Karina Constantino David of one of the groups who departed at the congress, March 28, 1990, *Documents of the Second National Congress of the Bagong Alyansang Makabayan* (Bayan, 1986), and interview with Etta Rosales, leading member of *Bayan*, March 23, 1990). And it was almost tragic-comical to hear in 1990 a leading member of this and similar organisations saying that contemporary attempts at more open attitudes had been approved 'from below', which has nothing to do with the grassroots but signals the underground top leaders (Interview Quezon City, March 1990)

- 27 Armed revolutionary forces had actually advanced to what is now the campus of the University of the Philippines in Diliman, Quezon City, Greater Manila
- 28 Interviews January 19 and March 14, 1990. It is unfortunate—and interesting—that a recent critical assessment with no PKP connections, of US policies in these matters, which goes back to the forties, does not discuss similarities between the dilemmas of the Left in, on the one hand, the late forties and early fifties and, on the other hand, the mid eighties. See Walden Bello, *US sponsored low intensity conflict in the Philippines*, Food First Development Report No 2 (San Francisco: The Institute for Food and Development Policy 1987)
- 29 For recent scholarly contributions, see for instance Rene E Orleneo, *Capitalism in Philippine Agriculture* (Quezon City: Foundation for Nationalist Studies, 1980) and by the same author *Deregulation and the Agrarian Crisis*, (Quezon City: Institute of Industrial Relations, 1987)

- 42 For Ferrer's earlier writings, see for instance his articles in *New Philippine Review*, Vol 1 No 1, and Vol 1 No 2, Vol 1, No 3, 1984 and 'On the Mode of Production in the Philippines: Some Old Fashioned Questions on Marxism in Marxism in the Philippines: Marx Centennial'.
- 43 Interview, March 21, 1990.
- 44 See my *Dilemmas*, op cit, and the two volumes of *What's Wrong*, op cit.
- 45 Ibid.
- 46 When nothing else is stated I draw mainly on Arnando Malay Jr, *The Dialectics of Kaluwagan: Echoes of a 1978 Debate*, P N Abinales, *The Left and Other Forces: The Nature and Dynamics of Pre 1986 Coalition Politics* and Alex Magno 'The Filipino Left and the Crossroads: Current Debates on Strategy and Revolution' in *Marxism in the Philippines: Second Series*, op cit, Gregg R Jones, *Red Revolution*, op cit, p 110ff and Ch 10, and interviews with Arnando Malay (March 19, 1990), and Alex Magno (March 12, and 12, 1990).
- 47 Sison was captured in late 1977 but participated in the early debate. Cf, his statement in Jose Maria Sison and Rainer Weiming *The Philippine Revolution: The Leader View* (New York: Crane Russak 1989) pp 103f.
- 48 Interview May 3, 1990.
- 49 Gregg R Jones *Red Revolution*, op cit, p 148ff. (Cf also *Liberation*, Vol XII Nos 1 and 2, 1984 and the Evaluations in Vol XII Nos 4 and 5, 1984.) It should also be noted that while the opposition against Marcos won almost nothing in terms of seats in 1978 the gains were substantial in 1984.
- 50 When nothing else is stated I draw mainly on Gregg R Jones *Red Revolution*, op cit Ch 12. William Chapman *Inside the Philippine*, op cit pp 229-31, and the two duplicated discussion papers from 1986 by Marty Villalobos 'Where the Party Failed' and 'On the Insurrectional Strategy in Parallelism: The Philippines now and El Salvador in 1979-80' in *Praktika* (A theoretical journal published by the CPP National Liberty Commission which appeared with two issues) Vol 1 No 2, 1987 and 'Counter Insurgency and the Peoples War in El Salvador' in *Kasarinlan* Vol 3 No 1, 1987 supplemented by interviews with Alex Magno March 1, 1990. I also his *The Filipino Left*, op cit p 83ff) and with Ed Tadem March 12 and 14, 1990.
- 51 Including a young intellectual activist who was sent from Manila later on became a major ideologue among the insurrectionists and in some writings used the name of Marty Villalobos.
- 52 Sison as well as Dante were detained but it is still interesting to note that both regarded the 'insurrectionist' line as 'adventurous' (Sison) and 'romantic' (Dante) Sison and Werning, *The Philippine Revolution*, op cit, p 129f, and interview with Dante, March 26, 1990.
- 53 With the name of Rudolfo Biazon.
- 54 See the mentioned discussion papers by Villalobos, especially *Where the Party*, pp 7 and 10-13.
- 55 I am drawing on discussions with and the writings of Bosco Parra, see eg, his 'Labour and Democracy in Chile', in *Strategies and Practices: Workers in Third World Industrialisation*, ed Inga Brandell (Macmillan, forthcoming).
- 56 Cf Gregg R Jones *Red Revolution*, op cit, pp 268-275.
- 57 When nothing else is stated on the united front policy, see P N Abinales, 'The Left and other forces: The nature and dynamics of pre 1986 coalition politics', in *Marxism in the Philippines: Second Series*, op cit, William Chapman *Inside the Philippine Revolution*, 214-229, and Gregg R Jones *Red Revolution*, op cit, Ch 13.
- 58 Named after an old political leader, Marcelo H del Pilar, 'Who Struggled Peacefully for Reforms but Remained Open to the Revolutionary Option' (Quoted from the cover of the second *Plaridel Paper* see next note).
- 59 For this and the following, I am mainly drawing on interviews with Horacio Morales, March 27, 1990 and Ed de la Torre May 3, 1990—supplemented by interviews with Isagani R Serrano, leading 'popular democrat' and Clark Soriano, director of the Institute for Popular Democracy, March 20, 1990—and the *Plaridel Paper's*, No 2, August 1984, and No 3, April 1985.
- 60 See especially *Plaridel Papers*, No 2, the quotation is from p 2.
- 61 I shall, however return to how it was possible for 'national democrats' to analyse the 'popular democrats' in such terms.
- 62 Which was associated with the concept of 'national democracy'.
- 63 One of the ways in which Sison accommodates the 'popular democrats' is, however, to say that they "Suggest a Better form of Bourgeois Democracy", and that "Initially Ours is Bourgeois Revolution" Interview May 3, 1990.
- 64 Cf also Ed de la Torre, *The Politics of Popular Democracy* (Institute for Popular Democracy Quezon City, 1986).
- 65 See especially *Plaridel Papers*, No 3.
- 66 Ibid, especially p 34ff.
- 67 The 'popular democrats' were of course right in saying that the 'national democrats' were not by definition against elections but simply claimed that one should only participate when and in such a way that, the strategic means and aims were not undermined but instead supported. Discussions about critical participation in elections scheduled for 1987 were actually under way (Cf *Plaridel Papers* No 3, p 32ff).
- 68 Interestingly enough, the 'popular democrats' had previously recalled the ways in which Washington had managed to out manoeuvre the Left as far back as the early fifties, by employing similar tactics. See *Plaridel Papers*, No 2 p 6ff.
- 69 See especially *Plaridel Papers*, No 3, p 30ff.
- 70 I should also be mentioned that, among others, Dante, the founder of the New People's Army, who was isolated in detention, tried to reach out with similar propositions. I shall return to Dante and his ideas.

ESSAR GUJARAT LIMITED

FORM IIA

See Rule 4A (1)

Form of general notice to be given to the members of the public before making an application to the Central Government under sub section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969

NOTICE

It is hereby notified for the information of the Public that Essar Gujarat Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under

1 Name & address of the applicant ESSAR GUJARAT LIMITED, Regd Office Post Hazira, Pin 394 270, Dist Surat Corporate Office 13th floor, Maker Chambers IV, Nariman Point, Bombay 400 021 (2) Capital structure of the applicant (as at 1.6.91) (a) AUTHORIZED (i) 19,00,00,000 Equity Shares of Rs 10/ each - Rs 190,00,00,000 (ii) 50,000 11% Preference Shares of Rs 100/ each - Rs 50,00,00,000, (iii) 10,00,000 - 14% Redeemable Cumulative Preference Shares of Rs 100/ each - Rs 10,00,00,000, Total Rs 200,50,00,000 (b) ISSUED & SUBSCRIBED (i) 7,22,16,767 Equity Shares of Rs 10/ each - Rs 72,21,67,670 (ii) 140 Preference Shares of Rs 100/ each Rs 14,000, Total Rs 72,21,81,670 (3) Management structure of the applicant organisation indicating the names of the Directors including Managing or wholetime Directors, if any. The company is managed by the Managing Director, subject to the control, direction and supervision of the Board of Directors of the Company. The names of the Directors of the Company are as follows (i) Shri S N Ruia (Chairman) (ii) Shri R N Ruia (Managing Director), (iii) Shri I C Jain, (iv) Shri D D Udeshi, (v) Shri K R Ramamani, (vi) Shri K C Ponnappa (Nominee GIC) (vii) Shri V Kapoor (Nominee IDBI), (viii) Shri C S Pani (Nominee UTI) (ix) Smt Lalita D Gupte (Nominee ICICI), (x) Shri M K Chanrai, (xi) Dr E R C Sekhar, (xii) Shri Sanjeev Shriya (xiii) Shri Prashant S Ruia (4) Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division. Yes - New Undertaking (5) Location of the new undertaking/unit/division. A new Public Ltd Co. in the Joint Sector with KSIIDC to be incorporated in Karnataka. The manufacturing unit is proposed to be located at Toranagallu Bellary, Hospet area in the state of Karnataka (6) Capital Structure of the proposed undertaking. Authorized Capital (Rs in Crores) Equity Shares - 650, Subscribed & Paid up Capital (Rs in Crores) (a) Foreign holding - Nil, (b) NRI holding on repatriable basis - 60, (c) Indian holding Public & Promoters - 555, Total 615 (7) In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate

(i) Name of goods Low carbon, medium carbon, low alloy, high alloy, flat products in the form of slabs/strips/sheets, coils, rods, bars and structurals granulated slags and by products from coke oven (ii) Proposed licensed capacity 30,00,000 tonnes per annum (iii) Estimated annual turnover Rs 3012 crores on full production (8) In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover etc. Not applicable (9) Cost of project Rs 3875 crores (10) Scheme of finance, indicating the amounts to be raised from each (Rs in crores) (i) Equity Capital/Retained Earnings/Convertible Debentures 968.75, (ii) Non Convertible Debentures 300.00, (iii) Rupee Loans from Financial Institutions 1911.14, (iv) Foreign Exchange Loans 695.11, Total 3875.00

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein

For ESSAR GUJARAT LIMITED

K M VENKATESWARAN
COMPANY SECRETARY

Dated July 5, 1991

External Liberalisation and Import-Dependence

A Note

Sunil Mani

This note examines whether the import-dependence of the industrial sector has increased in the post-liberalisation phase compared to the earlier period. The first section of the note considers the methodology of computing the import-dependence of the industrial sector, while the second section presents and interprets the empirical results.

INTRODUCTION

AN important facet of the economic policy shift in the 1980s has been the reduction in the discretionary role of government in industrial planning. Relaxation of government controls or doing away with controls altogether has been an important and integral part of this strategy which came to be epitomised as economic liberalisation. A rationale of this policy shift was the desire to enhance the export competitiveness of large sections of Indian industry. There are two components to this liberalisation—internal and external. The main component of internal liberalisation is reducing the domestic barriers to entry while external liberalisation encompasses a number of facets like liberalisation of the import regime for exporters, extension of fiscal and monetary concessions to place Indian exporters on par with their foreign competitors and finally rationalisation and simplification of export-import procedures. The belief was that such liberalisation of controls over imports would make available the much needed capital goods and raw materials to the exporter who would in turn produce quality goods for exports. While exports may have responded to some extent to these policy changes, the trade gap still averages around Rs 6,000 crore, especially since the mid-1980s. This failure of exports to catch up with the imports has resulted in the so-called 'foreign exchange crunch' which is bothering policy makers so much these days.

The manufacturing sector has registered an impressive growth rate of over 8 per cent during the 1980s.¹ A view has also been expressed that much of this growth has been import-propelled² and the maintenance of this high growth in the years to come is likely to be difficult if import curbs are to be imposed in response to the foreign exchange crunch. If that be the case, the high growth rate registered in the 1980s is hardly sustainable and the entire liberalisation process would prove to have had the effect of making the economy import dependent.

Against this brief background, the purpose of this note³ is to examine whether the import-dependence of the industrial sector has increased in the post-liberalisation phase compared to the earlier period. The note is in two sections. In the first section we consider the methodology of computing the import-dependence of the industrial sector

while the second section presents and interprets the empirical results.

I

We employ a series of indices to measure the import dependence of the Indian industrial sector. By the industrial sector we mean both private and public sector enterprises. We have restricted our exercise to non-financial enterprises in both sectors and, in the case of public sector, we include only the non-financial, non-departmental enterprises. In short, the exercise is restricted to manufacturing enterprises in the two sectors. The data on private sector enterprises are from the 'Finances of Large Public Limited Companies' brought out by the RBI⁴ and for the public sector they are culled from the *Public Enterprises Survey* released by the Bureau of Public Enterprises.

At the outset it is necessary to discuss the periodisation of the liberalisation measures. This is not exactly an easy task because there are different policy measures which are subsumed under the general label of 'external liberalisation' and these measures have been introduced at various points of time. However, one of the most important components of external liberalisation refers to the relaxation of controls on the import of capital goods. This can be seen from Table 1 which presents the trends in the number of capital goods placed on the Open General Licence (OGL) and the relative share of capital goods imports in total imports. The table suggests that external liberalisation reached its peak around 1985-86: the relative share of capital goods imports and the number of capital goods placed on the OGL have increased significantly after 1985-86. The average relative share of capital goods imports increased by nearly 10 percentage points from about 18 per cent during 1970-71 through 1985-86 to about 28 per cent during 1986-87 through 1988-89.⁵ Similarly, there was a 26 per cent increase in the number of capital goods placed on the OGL in 1985-86—the largest such increase in the decade. From this it can reasonably be concluded that 1985-86 was the year when major changes in external liberalisation were effected. So, for the purpose of our limited exercise of attempting to measure the import dependence of the industrial sector, we consider the period 1986-87 through 1988-89 as the post-liberalisation phase.

Turning to measures of import-dependence, we consider three such measures below.

(1) *Net Foreign Exchange Inflow Rate (NFIR)* This is basically the ratio of net exports to total exports of a specific industry. It should be mentioned that here we are concerned only with exports of commodities. The weighted average of these for the various industries during a year will provide us with the NFIR for the industrial sector as a whole during a year. In symbols

$$NFIR_i = \frac{X_i - I_i}{X_i}$$

where NFIR = net foreign exchange inflow rate for the i^{th} industry

X_i = exports of the i^{th} industry

I_i = imports of the i^{th} industry

TABLE 1. NUMBER OF CAPITAL GOODS ITEMS ON OGL AND VALUE OF CAPITAL GOODS IMPORTS

| Year | Value of Capital Goods Imports | Number of Capital Goods Items Placed on OGL |
|---------|--------------------------------|---|
| 1 | 2 | 3 |
| 1970-71 | 395 (24.17) | |
| 1974-75 | 696 (15.40) | Nil |
| 1975-76 | 935 (17.76) | 79 |
| 1976-77 | 1048 (20.65) | 167 |
| 1977-78 | 1110 (18.42) | 252 |
| 1978-79 | 1228 (18.02) | |
| 1979-80 | 1368 (15.36) | 386 |
| 1980-81 | 1821 (14.51) | 443 |
| 1981-82 | 1981 (14.49) | 553 |
| 1982-83 | 2231 (15.54) | 672 |
| 1983-84 | 3174 (20.05) | 754 |
| 1984-85 | 3027 (17.67) | 950 |
| 1985-86 | 4084 (20.78) | 985 |
| 1986-87 | 6279 (31.24) | NA |
| 1987-88 | 6135 (27.39) | NA |
| 1988-89 | 6713 (24.24) | NA |

Note: Figures in brackets indicate capital goods imports as per cent of total imports.

Sources: Column 2—RBI Reports on Currency and Finance, Volume II, various issues.

Column 3—World Bank, *India: An Industrializing Economy in Transition*, Report No 6633-IN, 1987, p 100.

(2) *The Import-Intensity Rate (IIR)*: This is measured as the ratio of imports to net value added expressed as a percentage. In symbols:

$$IIR_i = \frac{I_i}{NVA_i} \times 100$$

where IIR_i = import-intensity rate of the i^{th} industry

I_i = total imports of the i^{th} industry

NVA_i = net value added of the i^{th} industry

These two measures are quite comprehensive as they bring out the relative share of total imports of goods to exports and net value added respectively. Apart from the liberalisation of goods (viz, capital goods, raw material and stores and spares) the government had also liberalised disembodied technology imports not only through the mode of licensing agreements between Indian and foreign collaborators, but also having a more open attitude towards acquiring technology via the medium of direct foreign investment (DFI). This policy shift has been discernible since 1978. However, we measure the direct economic cost of such disembodied technology imports during the post liberalisation phase (i.e, 1986-87 through 1988-89) and compare it with the costs incurred during the pre-liberalisation phase. It should be added that, strictly speaking, one should be comparing the costs during pre- and post-1978 phases. But for consistency we adopt the same periodisation (i.e, pre- and post-1985-86). We define the third measure dealing with disembodied technology imports-related payments as follows:

(3) *Direct Cost of Technology Imports Rate (DCTR)*: This is defined as the ratio of the sum of royalty, technical fees and dividends to net value added and expressed as a percentage. In symbols:

$$DCTR_i = \frac{R_i + T_i + D_i}{NVA_i} \times 100$$

where, $DCTR_i$ = direct cost of technology import of the i^{th} industry

R_i = royalty payments of the i^{th} industry

T_i = technical fees payments of the i^{th} industry

D_i = dividend payments of the i^{th} industry

NVA_i = net value added of the i^{th} industry

II

The behaviour of NFIR during pre- and post-liberalisation phases is presented in Table 2.

Before we draw any inferences from the data, it is essential to make the following comments. The data pertain to over 600 large public limited companies in the private corporate sector (having a paid up capital of Rs 1 crore and above). The number of firms in both the periods is about 600 and

TABLE 2: NET FOREIGN EXCHANGE INFLOW RATE (PRIVATE CORPORATE SECTOR)—PRE- AND POST-LIBERALISATION

approximately 70 per cent of the companies covered in the pre-liberalisation phase are repeated in the post-liberalisation phase. In other words, the computations are by and large based on the same set of firms. With this caveat, the following points emerge from Table 2:

- (i) the NFIR has increased by about 23 per cent in the post-liberalisation phase,⁶ implying that the import-dependence of the sector has increased;
- (ii) though in terms of magnitude the NFIR of the private sector is much higher than the public sector, the rate of growth of the latter is higher;
- (iii) within the private sector, the NFIR of more than two-thirds of the industry groups has registered an increase during the post-liberalisation phase; and
- (iv) among the industry groups the one which has registered the highest growth rate in NFIR is the transport equipment industry—its NFIR has risen by 243 per cent, this is understandable as most of the external liberalisation policies were directed at the capital goods sector in general and the transport equipment industry in particular.

All the above inferences refer to the relative levels of NFIR during pre- and post-liberalisation periods. But if one were to analyse the *direction of movement* of the NFIR within the post-liberalisation phase, after showing an initial increase in 1986-87 in response to the policy shock, the NFIR for the next two years has been declining in the aggregate. But within the various industry groups, excepting for two (viz, silk

and rayon textiles) for a majority of the industries it has been fluctuating. So, based on the direction of movement of the NFIR, it is difficult to deduce that import-dependence have gone up in the phase, while based on the average level of the NFIR one can say that it has indeed risen to a higher level. One should of course bear in mind the short period under consideration while drawing these inferences.

Finally, a major problem with the above data base is that they do not include import-intensive industries like electronics and telecommunications.⁷ Had we included them, perhaps the NFIR for the post-liberalisation phase (i.e., the direction of movement) would have shown consistently an increase.⁸

We now turn to the other measure of import-dependence, viz, the share of imports in net value added (Table 3). The table confirms that the rate of import-dependence has increased and in fact has done so by as much as 29 per cent in the post-liberalisation period. The IIR of most of the industry groups has increased. The three industrial

groups, cotton and blended textiles, aluminium and basic industrial chemicals, have registered high growth rates of over 50 per cent. In the case of cotton and blended textiles much of the imports may have been for modernisation of the mills. As a matter of fact, the NFIR for this sector, though negative in the post-liberalisation period, had registered a fall of nearly 17 per cent. The increases in the IIR for aluminium can be attributed to the large-scale imports by the giant public sector unit, National Aluminium Corporation (NALCO). The NFIR for aluminium had shown a massive increase and same is the case with basic industrial chemicals.

Finally, we analyse the rate of direct cost of technology import during the two phases (Table 4). The DCTR, like the previous two measures, shows an increase. Among the three measures of import-dependence, DCTR has shown the highest increase of nearly 35 per cent.

Thus the three measures used in this note would suggest that the level of import dependence, variously defined, has shown an increase in the post-liberalisation phase. In fact, the rise in import-dependence would be seen to have been much higher had we included industries like electronics, telecommunications, etc., where the import-intensities are known to be very high. A much more disaggregated data base would also give us more insights into this aspect.

Notes

[Thanks are due to K K Subrahmanian, D Narayana, Anand Raj and B G Kumar for helpful comments on an earlier draft, to J Sreekumar for computational assistance and to D Girja for word processing. All remaining errors are my responsibility.]

Source: Annual Report, Department of Industrial Development, various issues.

lately circulating in the policy-making levels of the government" which showed a decline or at best stability in import-intensity in India's industrial production. We have essentially used the data base employed by Chandra Mohan (especially in his second article), expecting that he has taken into account only the post liberalisation phase. Second, the measures of import-dependence that we have employed are more comprehensive than the ones used by him.

4 See *Reserve Bank of India Bulletin*, May 1987, pp 362-70, and May 1990, pp 319-30. These companies together account for nearly 50 per cent of the paid up capital of the entire private corporate sector.

5 It will be quite instructive to find out which sector is accounting for the largest share of these increases in capital goods imports. Though the RBI data base relied on by us does give industry wise data on actual capital goods imports, the classification therein is too aggregative to assess the above meaningfully. However capital goods imports of more than Rs 1 crore have to be cleared by

the Capital Goods Committee. Data on such import approvals, industry-wise, for the years 1986-87, 1987-88 and 1988-89 are presented in Table A.

6 We have seen that one reason for liberalising imports was to promote exports. In this context it will be meaningful to analyse the behaviour of net exports in response to a unit of imports. It is possible to empirically measure this by defining a new index to measure the amount of net exports I_1 during a period to a unit of imports. Making the counterfactual assumption that there is zero lag between imports and exports it can be shown that

$$\begin{aligned} X_1 - I_1 &= \text{NEIR}_1 \\ \frac{X_1 - I_1}{I_1} &= \frac{\text{NEIR}_1}{I_1} \\ \text{Proof: } \text{NEIR}_1 &= X_1 - I_1 \\ \frac{X_1 - I_1}{I_1} &= \frac{\text{NEIR}_1}{I_1} \end{aligned}$$

$$\frac{X_1 - I_1}{I_1} = \frac{X_1}{I_1} - 1 = \frac{1}{1 - \text{NFIR}_1} - 1 = \frac{\text{NFIR}_1}{1 - \text{NFIR}_1}$$

Using the data in Table 2 it is seen that the negative net exports to a unit of imports have increased by as much as 10 per cent in the post-liberalisation phase. (I am grateful to D Narayana for the suggestion).

7 This is based on Bureau of Industrial Costs and Prices (BICP), *Report on Electronics, Studies on the Structure of the Industrial Economy 6*, Ministry of Industry, New Delhi, 1987.

8 But data on imports of electronic items into the country are not available. The department of electronics in its annual report publishes only data on production and exports. For a comment on the estimation of imports of electronic items, see K J Joseph 'Growth Performance of Indian Electronics under Liberalisation' in *Economic and Political Weekly*, August 19, 1989, p 1919.

MAHARASHTRA'S NEW LOTTERY

"SAUDAMINI"

On Every Friday from 21st June 1991

Common Prize For All Three Series

Rs. 1 LAKH

Also other prizes as mentioned below

24 prizes of Rs. 1000

24 prizes of Rs. 500

120 prizes of Rs. 100

1,200 prizes of Rs. 20

12,000 prizes of Rs. 10 and

1,20,000 prizes of Rs. 4.

Price of Ticket Re. 1 only.

MAHARASHTRA STATE LOTTERY

D.G.I.P.R.

Appropriating Ambedkar

Gopal Guru

IT is not surprising to receive reactions to my report 'Hinduisation of Ambedkar in Maharashtra' [EPW, February 16] from S H Deshpande [EPW, April 27] and Dhammachari Lokmitra [EPW, May 18] representing two different religious forces. Both of them have tried to argue that Ambedkar still fits into their scheme of Hinduisation and spiritualisation respectively. But careful and unbiased reading of Ambedkar provides a lot of scope to counter-argue that it is difficult for either Deshpande or Lokmitra to appropriate Ambedkar. Because the fragile logic of their rejoinder does not seem to support their motive of co-opting Ambedkar.

Deshpande raises two major points in his reply. According to him I did not take into consideration the difference between 'Hinduism' and 'Hindutva'. Secondly, he still holds the view that there is a possibility of comparison between Savarkar and Ambedkar but for such comparison Deshpande shifts the responsibility on somebody else who cannot be said to have either adequate or unbiased understanding of both Savarkar and Ambedkar.

Deshpande, taking clue from Savarkar argues that "The term Hinduism means the Hindu, religion or more properly, the Vedic or Sanatan Dharma. Hindutva on the other hand means the quality or property of being a Hindu i.e., one who belongs to any of the several theological or philosophical sects born in India. Thus, Hindutva embraces, Buddhist, Jains, Sikhs and members of all other indigenous school of thought"[1]. Deshpande argues that Savarkar did not want to protect Hinduism, but Hindutva, the Hindu people.

The distinction between Hinduism as a narrow category and Hindutva as a broader category worked out by Savarkar and now defended by Deshpande has problems at two levels. Does Savarkar really consider Hinduism as a narrow, secondary and less important component of his scheme of Hindutva? The second problem is related to the soundness and viability of his definition of Hindutva. In fact, a careful reading of Savarkar's core position on Hinduism and Hindutva shows that an appeal in the name of Hindu religion and even caste becomes a major programme for Savarkar who feared the mass conversion of Mahars to Islam or Christianity.

For example, in 1930 Savarkar argued that should conversion take place among the Mahars, 90 per cent of them would resist this conversion because they would be polluting their caste and caste panchayat which they were proud of[2]. Savarkar further argued that those Mahars who underwent conversion would be ostracised by their caste

fellows and would consequently lose their caste identity[2]. In a desperate bid to keep the Mahars within the fold of Hindu religion Savarkar advised the Mahars that the real progress of Mahars could be achieved only by remaining in the same Mahar castes[2]. Moreover the need to protect his so-called 'Hindutva' from Islam or Christianity also renders Savarkar's distinction between Hinduism and Hindutva invalid because he is found using Hindu religion and Hindutva quite interchangeably[2]. Thus, it is much to Deshpande's surprise that Savarkar is not able to resolve the contradiction in which he is found supporting the caste structure and Hindu religion on the one hand and trying to project Hindutva devoid of any sub-caste and religious dimension on the other.

Savarkar's strategy of dissolving more than 3,000 castes into one pan-Hindu identity involves pan Hindu temples, pan Hindu dinners, inter caste marriages, anti untouchability programmes and the removal of injunctions on caste-ridden vocations and sea voyage[2]. Thus, Savarkar seems to have admonished Hindus to break off the seven shackles that according to him hindered the progress of the Hindu society. Did this programme really denounce Hinduism? The answer to this question has to be in the negative because the anti-caste programme particularly relating to injunctions against inter caste marriage and advocating Vedic rights for the shudras and all shudras given by Savarkar did not have vigour and genuine thrust to attack the Hindu shastras and the caste system. Savarkar's contention regarding inter caste marriages looked to be so casual that he offered only a qualified support to such marriages, thus replacing the need for creating any conscious motivation necessary for the radical mobilisation of the people towards reaching the desired end[2]. Similarly, Savarkar's attempt to grant the study of Vedas and Vedic rituals to non Brahmins though apparently liberal may effectively lead to the Brahminisation of those non Brahmin castes thus according legitimacy to Hindu shastras[2].

On the contrary, Ambedkar considers inter caste marriages as the effective means for abolishing caste system[3]. But Ambedkar is also aware that inter caste dining or even inter caste marriages are not enough to eliminate casteism. He was of the opinion that for realising the desired goal of casteless society through inter caste marriages it is necessary to destroy the belief in the sanctity of Hindu shastras[3]. And for destroying this belief Ambedkar suggests that people should not only discard the shastras, but they should deny their authority as Buddha and Nanak did[3]. Thus it can be argued here that socially radical

Ambedkar was very unlikely to be attracted by Savarkar whose proposal, according to one of the sincere Savarkarites, contained reformatory zeal aimed at revival of Hinduism rather than its denunciation[4].

Finally, it is interesting to know how the cultural component of Savarkar's Hindutva defies not only its broader definition but it also renders the comparison between Savarkar and Ambedkar once again untenable. As seen in the beginning Savarkar and his present day followers consider Buddhism, Sikhism and Jainism as the part of Hindutva. But the followers of Savarkar miss the point that Savarkar refuses to accord importance to these religions, particularly to Buddhism, in his framework of Hindutva. For example, Savarkar seems to be despising early Buddhism on the ground that it diluted the strength of the Hindus by its belief in non-violence which rendered people weak and incapable of protecting Hindustan from Muslims and the British[5]. Savarkar's perception of Hindus as weak and victimised accounts for his emphasis on struggle and violence. But in contrast to Savarkar's militant Hindutva, Ambedkar's Buddhism preaches the principle of peace and non violence. Thus any attempt to bring Ambedkar and Savarkar together is an absurd exercise which some of the Savarkarites seem to be engaged in[6].

According to Deshpande, Savarkar's Hindutva does not refer just to religious identity but is supposed to refer to the socio-cultural identity of Hindus. But socio-cultural identity does not make sense unless it is a part of the self consciousness of the concerned community or it is a voluntarily accepted identity by the community in question. Otherwise it will not be a real identity but a fake imposed identity. Hindutva as understood by both Savarkar and Deshpande is not the part of the self-consciousness of Buddhists, Jains, Sikhs and so on and hence Hindutva is an imposed, artificial identity for them.

Deshpande's argument is fallacious because he treats the cultural concept 'Hindutva' as a kind of empirical concept which can be applied to persons irrespective of their self identification. Even the so-called Hindus within Vedic fold rarely identify themselves as Hindus, though they voluntarily identify themselves in terms of their castes. Even Ambedkar in the very first of his riddles in Hinduism points out the difficulty of knowing why one is Hindu. The essence of his argument is that a man who does not belong to a recognised Hindu caste cannot be a Hindu[3]. The question before 'Hindus' as defined by Deshpande is not how to preserve their 'Hindutva' which is a form without content, but rather how to become a true Indian and a true human being by sympathising with different cultural identities living in this country. In fact this is a question before people belonging to all religions.

Dhammabuchi Lokmitra's rejoinder raises one minor and four major issues[7]. While the minor issue is related to my unilateral imposition of 'dalit' identity on Buddhists in Maharashtra, the other four are serious in nature because they tend to question the quality of data on which I have based my argument, and my perception of Ambedkar's Buddhism and politics.

Before we take up the serious issues raised by Lokmitra, let us quickly tackle the minor one. Taking objection to my use of the word 'dalit', Lokmitra argues that according to his experience Buddhists in Maharashtra do not like to be addressed as 'dalit'. True, there is an urbanised microcosmic class of so-called Buddhists which despises the term 'dalit'. It is generally observed that the Buddhists living in the villages and the slums do not object when Ambedkar is called 'Dalitancha Kaiwari' (The messiah of 'dalit' masses). Some research studies have also highlighted that Buddhists are moving towards much broader terms like 'dalit' without dissolving their Buddhist identity[8]. Thus, in the social and political life of the 'dalit' in Maharashtra the term Buddhist and 'dalit' co-exist rather than contradict. In this regard, therefore, the experience of Lokmitra seems to be absolutely localised.

Now let us take up the serious issues that Lokmitra raised in his rejoinder. The first problem that Lokmitra raised regarding my report is that according to him I am ill-informed about the activities of Trailokya Buddha Mahasangha Sahayaka Gana (TBMSG) and that my analysis of TBMSG is based on Vinay Kamble's articles in *Dhammalipi* which according to Lokmitra are poorly researched. It is true that I have quoted from *Dhammalipi* but Lokmitra does not prove its flimsiness either. However, without relying on *Dhammalipi* it is still possible to prove how TBMSG is stripping off the political content of Ambedkar's ideology and making 'dalits' insensitive to their fundamental problems.

I have been conducting constant dialogue with TBMSG followers and have also written about its activities well before Vinay Kamble whose articles appeared in *Dhammalipi* only from 1989 January[9]. However, I must accept that I somehow missed the not so easily accessible TBMSG issue of *Golden Drum* which carried out almost an impartial reportage on Ambedkar's *Riddles of Hinduism*. It is not clear from Lokmitra's rejoinder whether TBMSG took up the issue of *Riddles*... and protested against the Maharashtra government's partisan attitudes on *Riddles* in its 'Dhyan Sadhana' class room. Neither is it clear from Lokmitra's reply whether TBMSG followers physically participated in the protest march popularly known as 'Bhim March' in 1987. Suppose the TBMSG followers participated in pro-Riddle 'Bhim March', thus giving the benefit of doubt to Lokmitra, but this participation as an extra parliamentary activity involving direct confrontation with the government, in fact, runs contrary to TBMSG's 'Dhyan

Sadhana Shibir' which seek to defuse social tension through meditation rather than confrontation with the party in question, thus the spiritual situation dominating every aspect of Buddhist teaching either in 'dharma' classes or formal meditation class naturally limits the effectiveness of the protest, if at all it is registered by TBMSG in its meditation classes.

On the contrary the Buddhist 'dalit' followers of Ambedkar and other progressive elements in Maharashtra fought for the retention of *Riddles* written by Ambedkar at every level of protest ranging from writing protest letters and articles in newspapers to physically participating in the 'Bhim March'. Even the Buddhist monks did not lag behind in condemning governments' anti-dalit attitudes on the *Riddles* issue, in the most militant language, and physically

participating in the 'Bhim March' at Bombay[10]. Consequent upon this total protest the state government had to retain the riddle section of Ambedkar's writings.

It is in this context that I reassert that TBMSG's activities lead to the killing of political initiative of 'dalits' who are trying to confront the state and other communal forces not through the meditation but on the street, well outside the four walls of Dhyan Sadhana class room. In view of the growing threat of aggressive communalism of Hindu fundamentalist forces in the country, the guarantee of at least physical existence of 'dalits' becomes a core issue, and the anti-superstition programmer welfare programmes taken up by TBMSG are pushed to the periphery by Ambedkar's common followers who do not seem to be keen on joining TBMSG.

THIRD WORLD RESURGENCE

the Third World's own magazine

The 1990s will be a crucial watershed for humanity. Yet almost all the news reports we get are from the western media.

As our world transforms, we need to watch through Third World eyes.

That's why a Third World team of journalists and writers are

publishing Third World Resurgence. To articulate the views of Third World groups. To give a Southern perspective to issues related to living and livelihood: environment, basic needs, politics, current affairs, culture.

Join us in this journey of discovery and make the Third World's resurgence a reality.

In our recent issues...

| ECOLOGY | HEALTH | INTERNATIONAL AFFAIRS | ECONOMICS |
|--|--|---|---|
| What Green Means for Third World, Global warming caused by rich countries, France poisons Pacific, Japan threat to world ecology | Global drug laws reflect North-South imbalances; Does Birth Control solve Third World problems; Toxic wastes as recycled products. | 500 years of Colonisation; Gulf. Most cowardly war ever, Myth of the Nobel Prize; North-South relations in the New World Order. | GATT talks threaten Third World Sovereignty; Real issues in Uruguay Round; Aid from Latin America to the North; TNCs corrupt Third World leaders. |

that Lokmitra in defence of the meditation of TBMSG argues that it does not teach transcendental meditation of Mahesh Yogi's kind. But does it not teach 'meditation' concerned with the so-called transcendental reality, the so-called higher, super-human states? This apprehension gets further strengthened when Sangraksht, the chief of TBMSG, talks about a movement from self-consciousness to transcendental consciousness without explaining what it is all about[11]. Suppose the TBMSG concept of meditation does not belong to Yogi's system, but does this spiritualism belongs to Ambedkar's system of thought? Lokmitra while answering this question in the affirmative argues that Ambedkar also emphasised the need for meditation for elevating the mind from its diseased state (hatred, anger and greed) to the higher level of sound mind leading to 'maitri' and 'bhavana' or universal loving kindness. Lokmitra, in his defence further, quotes Ambedkar saying that "the greatest thing the Buddha has done is to tell the world that it can only be reformed by the reformation of mind of man and the mind of the world" is the precondition for social change"[7]. Let us see whether Ambedkar really thinks so! It is clear from Ambedkar's speeches that he considers change in the material condition rather than spiritual condition necessary for bringing about total social change[7]. It is really surprising how Lokmitra missed this while quoting from the speech that Ambedkar delivered on the eve of Buddhist conversion at Nagpur in 1956.

Lokmitra is quite persuasive in establishing the dichotomy between Buddhism and politics which even a superficial reading of Ambedkar will show was not followed by Ambedkar throughout his intellectual and practical life. Ambedkar who was both a political thinker as well as practitioner wrote and worked out strategies of emancipation with the political dimension uppermost in his mind. It is true that he did not look at the conversion movement from the point of view of formal parliamentary politics. On the contrary it may also be true that he did not explicitly delineate the political aspects of Buddhist teaching. But it cannot be said that Ambedkar's Buddhist teaching or conversion was devoid of any politics. In fact, a careful study of Ambedkar shows that his Buddhism and conversion movement involved underlying political currents with the potential of leading to the long-term emancipatory politics of the 'dalit' masses.

Ambedkar considered the *Gita* a political book aimed at upholding the teaching of the vedas and raising brahminism to a supreme position[13]. Applying the same logic of Ambedkar should we not look at Ambedkar's book *Buddha and his Dhamma* as a political book in as much as it negates brahminical domination. Similarly, as Raosaheb Kasbe has rightly interpreted Ambedkar's Buddhist dhamma is the basis of any political system based on liberty, equality, fraternity and justice. According to

Kasbe, Ambedkar believed that a political system which is not based on dhamma would degenerate into an anarchy[14]. Moreover, Ambedkar's Buddhist conversion was not a religious conversion but was a strategy for creating negative consciousness among the 'dalits' against the hegemony of the dominant castes/class[14]. In fact Ambedkar has categorically made it clear that Buddhism is one of the essential elements in the process of bringing about political revolution leading to the overthrow of such domination[3].

When the TBMSG has obscured the political aspect of Ambedkar's Buddhism spiritualising Buddha and his 'sangha'[15] and the Bharatiya Bouddha Maha Sabha is concerned about ritual (mundane) part of Buddhism it is really necessary to restore the political content of Buddhism. The separation of Buddhist 'trisanan' from 'panchshil' is an attempt at not only the restoration of this political content but it also ensures the capability of reaching out to the larger masses with this political content. This separation does not mean an elimination of 'panchshil' which has meaning only when the necessary conditions for its observance are created in the first instance. These necessary conditions can be created only by waging common struggle and not by spiritualisation. Only Buddhist 'trisanan' can offer a common programme for mobilisation.

Thus, as it is clear from the above passage, I am adding a political dimension to Buddhism, but it is Ambedkar who tried to enthuse it in Buddhist teaching and practice to help the 'dalit' masses understand that the solution to their problems lies in their radical politicisation and not in spiritualisation. Therefore, Lokmitra and his TBMSG are free to sell their package of spiritual Buddhism and synthesise it with anything but not with Ambedkar's Buddhism. Because it does not allow such synthesis.

INDIAN SHAREOWNERS—A SURVEY

By L C GUPTA

Sponsored by

Securities and Exchange Board of India
Bombay Stock Exchange
Canbank Financial Services Limited
SBI Capital Markets Limited

Published by

Society for Capital Market Research and Development, 74 Vaishali, Pitampura, DELHI 110 034

Based on interviews of about 6000 households all over India during 1990, the study explores such questions as

- ★ Who are Indian shareowners? What is their income, occupation, age, and educational background?
- ★ What are their preferences among 17 different financial assets including fixed deposits, mutual funds, savings certificates, etc
- ★ How has their number grown over the last 40 years?
- ★ What has been their risk perceptions among financial assets and experiences of share investment?

Hard bound (pp xviii + 173)

**NOTES ANNEXED TO AND FORMING PART OF THE ACCOUNTS OF THE
INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1991**

- STATEMENT OF ACCOUNTING POLICIES**
 - BASIS OF PRESENTATION**
The financial statements have been prepared on the basis of accounting principles and uniform with the statutory requirements prescribed under the Banking Regulation Act 1949.
 - FOREIGN CURRENCY TRANSLATION**
Assets and liabilities in foreign currencies are translated at year end rates of exchange. Revenues and expenses have been translated at rates prevailing on the transaction date. Foreign exchange trading positions including spot and forward contracts are valued monthly at prevailing market rates and the resulting gains and losses are included in foreign exchange revenue.
 - CREDIT LOSSES**
The bank has a consistent internal policy of classifying its commercial and consumer loans and advances and the bank has a credit loss and write-off, if any, have been made on the basis of this classification.
 - PREMISES AND EQUIPMENT**
Premises and equipment are stated at cost less accumulated depreciation. Depreciation is computed on the written down value basis on the estimated useful life of the asset.
 - STAFF BENEFITS**
The bank has fully funded the Provident Fund and Superannuation benefits for its employees.
 - NET PROFITS**
The net income disclosed in the Profit and Loss account is after:
— accounting for credit losses
— valuation adjustments in respect of securities
— provision for income taxes
— other usual or necessary provisions.
- 2** The Bank has retained in the Properties Investment Reserve as at March 31 1991 Rs. 419 340 700 (1990 Rs. 240 944 700) as per the Reserve Bank of India's guidelines representing Deposits for Premises taken on lease and purchase of properties. Of this amount a sum of Rs. 140 000 000 is set aside from the current year's Profits for which the bank intends to obtain the Reserve Bank of India's approval for this purpose.
- 3** Other liabilities include full provision made by the bank on account of gratuity payable to staff as at March 31 1991 amounting to Rs. 21 125 259 (1990 Rs. 26 506 000).
- 4** Surplus Accounts under the head Other liabilities and Other Assets include amounts pending transfer to appropriate accounts.
- 5** Subsequent to the close of business as of March 31 1991 the bank has lodged additional securities with the Reserve Bank of India amounting to Rs. 150 000 000.
- 6** Other investments include Pass Through Certificates amounting to Rs. 151 018 918 14 (1990 NIL).
- 7** Bills received from constituents for collection on their behalf are controlled through memorandum registers and recorded in financial ledgers only when collected. These bills for collection outstanding as on March 31 1991 have, however, been shown in the Balance Sheet under the relevant heads of account.
- 8** Investments Equity shares include partly paid shares amounting to Rs. 300 000 (1990 NIL).
- 9** Prior year figures have been regrouped wherever necessary.
The Indian Branches of the Bank as at March 31 1991 are at Bombay (Fort and Norman Point) Calcutta (Chowringhee and Beshmeyer Road), New Delhi (Gurgaon Branch) and Madras (Anna Salai).

(INCORPORATED WITH LIMITED LIABILITY IN THE U.S.A.)

AUDITORS' REPORT ON THE ACCOUNTS OF THE INDIAN BRANCHES OF CITIBANK, N.A. UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949

We have audited the attached Balance Sheet of the Indian Branches of Citibank N.A. (Incorporated with Limited Liability in the U.S.A.) as at March 31 1991 and the relative Profit and Loss Account of the Indian Branches of the Bank for the year ended on that date signed by us under reference to this report

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of sub sections (1) (2) and (5) of Section 211 and sub section (5) of Section 227 of the Companies Act 1956 the Balance Sheet and Profit and Loss Account together with the notes annexed thereto are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act 1956. The accounts are therefore, drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act 1949

We report that

- 1 We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory
- 2 the transactions during the year which have come to our notice have been in our opinion within the powers of the Indian Branches of the Bank
- 3 in our opinion proper books of account as required by law have been kept by the Indian Branches of the Bank so far as appears from our examination of these books maintained and produced to us
- 4 the abovementioned Balance Sheet and the Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account
- 5 in our opinion and to the best of our information and according to the explanations given to us the Accounts together with the notes thereon give the information required by the Companies Act 1956 in the manner so required for Banking Companies and on such basis give a true and fair view in the case of the Balance Sheet of the state of affairs of the Indian Branches of the Bank as at March 31 1991 and in the case of the Profit and Loss Account of the Profit of the Indian Branches for the year ended on that date

Vol XXVI No 29

July 20, 1991

Odour of Surrender

We have played into the hands of the IMF/World Bank experts whose theology that market forces alone can lead to the optimal development of an economy is based on wrong premises and wrong interpretation of the development programmes of countries like Japan and South Korea. 1713

The terms and conditions prescribed by the IMF and the World Bank suit the private interests of some of our own businessmen and politicians and so it will be difficult to loosen the Fund-Bank grip on the economy. 1736

The devaluation of the rupee at a time when both domestic economic growth and world trade are forecast to decelerate is unlikely to produce the expected salutary impact on exports. 1724

Even as the government is feverishly negotiating a big IMF loan under its structural adjustment facility, the fresh credits from abroad which the finance minister expected to flow in after the rupee devaluation and the changes in foreign trade policies as desired by the IMF-World Bank combine are still being held back. The intention is to expose India's abject helplessness. 1723

Budget Posers

If the objective seriously is to reduce government dissaving and cut deficit financing, then the budget-makers cannot get away by setting their sights only on the fiscal deficit without specifying how the targeted reduction in the deficit is to be achieved. 1721

None of the studies of the income elasticity of personal income taxation in India quantifies the impact of trends in inequality in the distribution of income on the elasticity of the tax. An attempt to fill this gap. 1741

The revenue raising potential of the government's decision, taken in December last year, to put a limit on allowable depreciation by companies was largely frittered away due to the existence of a number of tax offsetting provisions in the corporate tax system. The major leakages and ways to plug them. 1749

Establishment View

What the ruling class thinks of a rebellion, what it wants the rebellious classes and the intermediary classes to think it thinks and what it wants these people themselves to think are three different though closely interrelated things. A study of a Telugu film on Naxalites. 1727

Efficiency Denied

Efficiency or merit is not a fetish of the elite, but an essential ingredient in every walk of life and the policy of reservation for backward classes is a major barrier to achieving efficiency. 1732

Essential Saddam

While Saddam Hussein is no doubt to be shunned now, it is necessary for the US to find a Saddamite clone, preferably another Baathist Sunni dictator, who will mesh with the requirements of US policy. 1734

Financial Reform

Does the financial services sector in India have the confidence and the credibility to implement any kind of reform? 1718

Manipuri's Claim

The long-standing and legitimate demand for the inclusion of the Manipuri language in the eighth schedule of the constitution is beginning to acquire a militant hue. 1725

Communists and Democracy

The different sections of the radical left in Philippines have failed to carry out materialist analyses, within the framework of their basic theses, toward a fruitful and convincing understanding of political transformation in general and the growing importance of the struggle for political democracy in particular. A study of communists and democracy. 1757

Applications are invited for the following positions to be filled in at Bombay and Pune. Prescribed forms are available at the University between 10.30 a.m. to 1.00 p.m. and 1.30 p.m. to 2.30 p.m. on any working day except 2nd and 4th Saturdays and Holidays on payment of Rs. 25/- for teaching post and Rs. 15/- for non teaching post by cash or M.O. Applications on these forms should reach on or before August 11th, 1991. Applications received after due date will not be considered. The (+) Sign indicates additional qualification.

POSITIONS AT BOMBAY

(A) PROFESSORS

Basic Qualifications: Eminent Scholar with Doctoral Degree in relevant subject with published work and research of high quality. 10 years experience of teaching and/or research and experience of guiding research at Doctoral level essential. (Other specific requirements as indicated against each post) **Pay scale:** Rs. 4500/- to 7300/- plus admissible allowance.

PROFESSOR IN: (1) Family Resource Management (Home Science) (2) Pharmaceutical Analysis (Plan Post) (3) Statistics and Economics (Doctoral Degree in Statistics with Economics background essential) (4) Director for Research Centre for Women's Studies (Research Experience in Women's Studies essential) (5) Sociology (6) Political Science (Plan Post)

(B) READERS

Basic Qualifications: Eminent Scholar with Doctoral Degree in relevant subject with published work and research of high quality. 5 years experience of teaching. **Pay scale:** Rs. 3700/- to 5700/- plus admissible allowance.

READERS IN: (1&2) Special Education **TWO POSTS** (One reserved for SC/ST) (3) Extension Education (Home Science) (4) Food Science & Nutrition (Home Science) (5) Textile and Clothing (Plan Post Home Science) (6) Human Development (Home Science) (7) Phytochemistry/Pharmacognosy (Plan Post) + or M.Pharm 1st Class in relevant specialisation with 8 years Teaching experience as Lecturer at Degree level (8) Computer Science (Plan Post) Doctoral Degree in Maths/Stats/Physics/Applied Physics/Electronics/Instrumentation of First Class Master's Degree in Engineering/Technology and 5 years experience in Teaching Industry/Research in field of Computer Science applications (9) Pharmaceutics (10) Economics (Plan Post) + Knowledge of Quantitative Techniques preferred (11) Psychology (Clinical Psychology preferred) (12) Education (Educational Technology and/or guidance and counselling preferred) (13) Gujarati (Under DSA) (14) Art and Painting

(C) LECTURERS

Basic Qualifications: Master's Degree in the relevant subject with at least 55% marks. (Other specific requirements as indicated against each post) **Pay scale:** Rs. 2200/- to 4000/- plus admissible allowance.

LECTURERS IN: (1) Family Resource Management (2) Pharmacy (Plan Post) Specialisation in Pharmaceutics/Pharmaceutical Chemistry/Pharmacognosy preferred (3) Computer Science (Plan Post) First Class Master's Degree in Computer Science of Computer applications/Maths/Stats/Physics/Applied Physics/Electronics/Instrumentation/Computer Science of I Class Bachelor's Degree in Engineering/Technology. Knowledge of Computer Science/Programming essential (4) Economics + (Knowledge of quantitative techniques preferred) (5) Marathi (Plan Post) (Reserved) + New Criticism 19th Century Social Cultural background. Experience in Research. Editing Translation preferred (6) History (Plan Post Reserved for SC/ST) (7) Education—(Marathi Medium), Hindi & History (Reserved) (8) Education—Science & Maths (9) Education—History/Geography/Gujarati (10) Language Teaching (M.A. in English/Marathi/Gujarati with at least 55% marks with linguistics as one of the subjects) (11) Commerce (12) Nursing (Specialisation in Community Health preferred) (13) Gujarati (Under DSA) (14) Food Science and Nutrition (Home Science) (15) Family Resource Management (Home Science Architect and Interior Designer required) (16) Human Development (Home Science) (17 & 18) Extension of Education (**TWO POSTS**)—Master in Communication with Experience in Audio Visual production preferred

NON-ACADEMIC POSTS

(1) Resident Engineer—M.E. with at least 8 years experience in a similar capacity in Educational/Government Institutes and not less than 30 years of age. **Pay Scale:** Rs. 3000/- to 4500/- (2) Assistant Librarian—Master's Degree in Library or Information Sciences/Documentation or an equivalent professional Degree with at least 55% marks. Master's in Arts/Science/Commerce with Bachelor's Degree in Library or Information Sciences/Documentation. Medium of Instruction are Eng/Mar/Guj/Hin. **Pay Scale:** Rs. 2200/- to 4000/- (3) Hall Manager for Patkar Hall. Preferably Graduate with Diploma/Experience in theatre jobs. Should have knowledge of accounts managerial skills. Job involves Technical/Electrical work in a theatre. **Pay Scale:** Rs. 2200/- to 3700/- (4) Sister Tutor (Temporary for 2 years) at L.T. College of Nursing. Master's Degree in Nursing. **Pay scale:** Rs. 2000/- to 3500/- plus perks (5&6) Ward Sister in L.T. College of Nursing. Bachelor's Degree in Nursing. Medium of instruction is Eng. **Pay Scale:** Rs. 1640/- to 2900/- (7) Senior Library Assistant (Reserved) M.A./M.Sc./M.Com. with I or II class with B.Lib. Sci. Degree with 2 years experience or B.A./B.Sc./B.Com. with I or II class and M.Lib. Sci. Degree at least in II class with 2 years experience. **Pay Scale:** Rs. 1640/- to 2900/- (8&9) Technical Assistant (**TWO POSTS**) in the Department of Computer Centre. B.Sc. with diploma in computer application. **Pay Scale:** Rs. 1640/- to 2900/- (10,11,12,13&14) Junior Library Assistant (**FIVE POSTS**) (1 Reserved) Graduate in any field with Diploma/Degree in Library Science preferred. **Pay Scale:** Rs. 1400/- to 2300/- (15) Assistant Cashier—B.Com. Preferred with 3 years experience of handling cash and allied accounts work. **Pay Scale:** Rs. 1200/- to 2040/- (16&17) Laboratory Attendant (**TWO POSTS**) (1 Reserved) HSC with Science subject Graduate preferred. **Pay Scale:** Rs. 975/- to 1540/- (18&19) Research Assistant (**TWO POSTS**) (under ICAR) **Pay Scale:** Rs. 1500/- (consolidated) (20&21) Research Assistants (Home Science) (**TWO POSTS**) i) Microbiologist ii) Biochemist (22) Technical Assistant **Pay Scale:** Rs. 500/- to 900/- (Unrevised) for Posts 20 to 22

POSITIONS AT PUNE

PROFESSORS (Basic qualifications and Pay scale applicable as in A above)

(1) Communication Media for Children (Degree in communication practical work publication and experience work with and for children preferred)

READERS (Basic qualifications and Pay scale applicable as in B above)

(1) Home Science (2) Economics

LECTURERS (Basic qualifications and Pay scale applicable as in C above)

LECTURERS IN: (1&2) Family Resource Management (**TWO POSTS**) (Temporary) Medium of Instruction Marathi (3) Hindi (Reserved) Medium of Instruction Hindi/Marathi (4) Education M.Ed. with E.M. Teacher Education one of the methods in Hindi Medium of instruction Marathi/Hindi (5) Food Science & Nutrition (Reserved) medium of instruction Eng/Mar

NON-ACADEMIC POSTS

(1) Maintenance Engineer—BE (Electronics) or M.Sc. (Physics) with Electronics from recognised Institute and two years experience in TV Broadcasting. **Pay Scale:** Rs. 2200/- to 4000/- (2) College Librarian (Education) I/II Class at B.A./B.Sc./B.Com. + I/II Class in M.Lib. Sci. or I/II Class at M.A./M.Sc./M.Com. + I/II Class at B.Lib. Sci. or Diploma in Library Science. **Pay Scale:** Rs. 2200/- to 4000/- plus perks (3) Senior Library Assistant at Branch Library (1 Reserved) M.A./M.Sc./M.Com. with I or II class with B.Lib. Sci. Degree with 2 years experience or B.A./B.Sc./B.Com. with I or II class and M.Lib. Sci. Degree at least in II class with 2 years experience. **Pay Scale:** Rs. 1640/- to 2900/- (4) Senior Technician—B.Sc. with Diploma in Electronics and Radio Engineering. One year experience of repairing and servicing electronic equipment. **Pay Scale:** Rs. 1400/- to 2300/- (5) Laboratory Assistant (Reserved)—HSC with Science subject preference B.Sc./B.H.Sc. **Pay Scale:** Rs. 975/- to 1540/- (6) Sound Recordist—Diploma/Degree in Sound Recording with two years experience. **Pay Scale:** Rs. 470/- to 630/- (unrevised)

DR. A.G. BHALWANKAR
REGISTRAR

Apologia for the Army

THE recent report of a Press Council team on the media situation in Kashmir and Punjab is entitled 'Crisis and Credibility'. A better title would have been 'Onward Indian Soldiers...'. The entire report, the main body of which is devoted to Kashmir, is a paean to the glorious role that the Indian army is playing in that state and questions the credibility of journalists and civil liberties groups which had been highlighting cases of violation of human rights by the army there.

The team, which interviewed army personnel, local officials and, in some cases, villagers who claimed to be victims of army atrocities, has come to the conclusion that most of the allegations made against the Indian soldiers are either gross exaggerations or pure inventions. The basis of the conclusion is its finding of inconsistencies and inaccuracies in the evidence given by the villagers at various times. The team members have taken great pains to prove that women of the village of Kunan Poshtpora in particular failed to give consistent replies to questions like whether they were raped or molested, whether a child was born to a woman before the alleged rape or after, whether signs of abrasions on their chests were those of molestation or of 'kangris' (earthen pots with live coals) that they carried during winter months, whether torn hymens (which were confirmed by the block medical officer who examined the victims who claimed to be raped) could have been a result of natural factors, injury or pre-marital sex. One is really impressed by the cross-examination carried out by the team in order to disprove allegations of army atrocities!

Curiously enough, attempts at such a careful and exact investigation seemed to be absent in the team's questioning of the army people—as evident in the report. In a section entitled 'The Military Version' (paragraphs 206-215), the team accepted without batting an eyelid whatever the army authorities said: that they conducted a cordon-and-search operation in the village of Kunan Poshtpora during the night of February 23/24 following which the army's medical officer early in the morning "set up a clinic which was attended by 23 persons, including eight women some of whom bore names similar to those who were subsequently named as rape victims" (it did not evidently occur to the team members to ask why it was necessary to suddenly set up a clinic in the village at that hour, and why these women came there); that after the raid was over "some village notables and the two J and K (Jammu and Kashmir) constables signed a no-objection certificate,

which is a standard requirement..."; that the army column left the village "in a friendly atmosphere exemplified by the fact that the [army] men were offered fruit and eggs".

After this *bonhomie*, some villagers from Kunan Poshtpora visited the brigadier of the area on February 27 and complained about the rape of their womenfolk by his troops. The brigadier later visited the village, was confronted with 13 women who said that they were raped, but he dismissed the charge as "malicious and untrue" (paragraph 197). The Press Council team agrees with the brigadier's version and dismisses the incident as "an invention, a hurriedly contrived piece of dissimulation" (paragraph 256). One of the reasons for its coming to this conclusion is that the village headman had signed the no-objection certificate after the raid, thereby exonerating the army of any misdeed. Yet it is well known how such certificates are obtained from villagers by gun-toting army men. In fact, the team members themselves at one point in the report admit that such certificates are "signed and easily disowned under pressure" (paragraph 345). How then could they have accepted such a certificate as evidence that everything was hunky-dory during the raid?

According to the team, "one extra-judicial killing or a single rape" by army men could be more a "product of human failure or frailty and emotional stress than of deliberate state policy" (paragraph 326). By that same logic 'one' case of inconsistency, or a 'single' instance of exaggeration (which led the team to dismiss the entire evidence of the villagers as an 'invention') could have also been considered as a product of 'human failure or frailty and emotional stress' undergone by the villagers in the course of the army raid, rather than as their 'deliberate' attempt to concoct a story. But the Press Council team is not willing to show the same consideration and sympathy for the frailty of the villagers as for that of the army men. While frailty of the former could have led to oral 'exaggerations' or even 'inventions', the frailty of the latter invariably led to physical assaults like killing or rape. Surely, one should make a distinction between the two. The Press Council team's tendency to believe whatever the army bosses told it as gospel truth and to suspect every assaulted woman of "being tutored and coerced into making statements..." (paragraph 337) is not only highly insulting to those unfortunate victims, but also betrays a bias that strikes at the very roots of the council's claims to impartiality.

POLITICS

Flip-Flop Game

EVEN as leaders of the main political parties are at pains to emphasise their parties' ideological and programmatic distinctness, many coquetties are revealed by current parliamentary practice. Consequently a government which is in a minority in the Lok Sabha has not merely been able to command the confidence of the house but is also enabled to take major and substantive decisions on critical matters, in the process vindicating president R Venkataraman's invitation to the Congress to assume office. The non-chalance with which the minority government is carrying on like a secure majority government gives the lie to the opposition parties' scathing criticism of not only the decisions taken by the government but also its penchant for taking such decisions without consultation.

It is quite evident that within parliament clandestine deals are being arranged in the name of floor management. Thus when it came to the election of the speaker the BJP quite readily supported the Congress(I) nominee Shivraj Patil in return for a BJP nominee's installation as deputy speaker. Conveniently reference is now being made to the 'convention' that the deputy speaker is an opposition nominee. It may be recalled that this convention has in the past been practised only by non-Congress governments and never by the Congress.

It is pertinent that the BJP has been no less vocal than the rest in decrying the government's various decisions. More to the point the BJP has been a consistent critic of the Congress(I)'s attempt to appropriate the nation's unity and integrity by equating its government with stability. On this occasion it was P V Narasimha Rao's claim that for the Congress to run the government it was imperative that the speaker should be from its ranks. It is therefore difficult to be persuaded by the BJP's attempts to re-establish its credentials by opposing the motion of confidence in the government, particularly in the light of I K Advani's suggestion that the days of anti-Congressism are numbered.

In like vein the left has been indignant about the government's recent and continuing tampering with the economy and has been especially unsparing in its criticism of the fact that all this was undertaken even before parliament met and before even the Lok Sabha's trust in the government was proved. Yet it was instrumental in forcing the decision of the National Front-Left Front to abstain from

participation in the vote on the trust motion. For obvious reasons support for the government was ruled out, yet the left was unwilling to see its defeat and this after accusing the BJP of collusion with the Congress(I).

Clearly the inability to initiate a coalition arrangement and the fear of pulling down the government has paved the way for inconsistent behaviour. While the left is now busy mobilising opinion against the government's intended reforms there is no move in parliament to exploit the frailty of the government. It almost appears that the left has given its tacit consent to the economic changes under way. Or else the fact that the left's generosity to the Congress(I) has gone unrequited will have to be seen as one more illustration of the former's lack of tactical finesse. Either way the left has little to gain.

SERVICE EXPORTS

Unfair Treatment

IN his statement on the government's new trade policy the commerce minister P Chidambaram, while explaining how the new system of more liberal but uniform replenishment licensing at the rate of 30 per cent for all exports instead of the erstwhile 5 to 20 per cent rates will be more transparent and free, added that it was intended to replace the 'Exim Scrip' (the new name given to the Replenishment Licence) by a 'Foreign Exchange Certificate' (FEC). In that context Chidambaram added further, and quite significantly, that "FECs will also be more effective in the area of export of services."

The above observation is significant in many respects. First it is the only reference to services in the whole statement on the new trade policy. The rest of the statement is devoted to visible trade. Second, it would appear to reflect current thinking in the government on the subject of service exports in the sense that even service exports may be considered eligible for FECs.

In this context it is worthwhile recalling that there did exist in the sixties a scheme under which all foreign exchange receipts, including those by way of gifts, were eligible for a sort of import entitlement that was tradable and was indeed freely traded. The banks would realise the premium on behalf of their clients and give them the necessary credit.

The point is that once it is recognised that foreign exchange earnings on account of export of services are no less desirable and therefore as much worthy of attention as those from exports of goods, the case for the eligibility of the former to the

proposed FECs is clear. In fact, the case is stronger if one follows Chidambaram's logic when he expatiates on the particular merits of fixing the uniform rate of 30 per cent for all exports. He claims that his new scheme "gives maximum incentives to exporters whose import intensity is low" and illustrates his point by referring to agricultural exports which earlier had very low replenishment rates of 5 per cent or 10 per cent and will now gain considerably. By the extension of the same logic service exports should straightaway be entitled to the Exim Scrips. Why should they be excluded until such time as these scrips are redesignated as FECs?

The same sort of question can be addressed to the finance minister also because today service export earnings are being discriminated against in the matter of income taxation. While export profits as narrowly defined to arise from the export of goods are totally exempt, income from service exports enjoys exemption, and that too not fully, in only a few selected cases arbitrarily chosen for favoured treatment.

BIG DAMS

Blinkered Vision

THE problem being posed by the possible submergence of the villages in Maharashtra illustrates well the range of overlapping and interconnecting issues which must be resolved before embarking on a project such as the damming of the Narmada. According to the report of the Narmada Control Authority, apparently no village, either in Gujarat or Maharashtra, was to be submerged this monsoon. Only in 1993 was there to be submersion of seven villages in Gujarat temporarily and of three villages in Maharashtra permanently. Sometime in May, however, officials descended on these villages and proceeded to force the people to sign on a document which stated that they had found an alternative settlement area and were moving out of their own accord. This was being done, the officials said, because there was danger of these villages being submerged this monsoon.

Clearly there has been either a major communication gap or, more likely, grand miscalculations. The probability of a village being submerged depends as much on the status of the construction as on such details as river flow, projected volume of water at different points in the river, etc, which obviously have not been fully taken account of. But what is even more likely is that the Narmada Control Authority knew full well that these villages would be submerged this monsoon, but

saw fit to misinform the people on this count.

All this has highlighted another problem. The people of these villages were to be moved to an area in Taloda which is to be cleared of some 2,769 hectares of prime forests. This would have jeopardised the livelihood of some 40 villages which depend on the forest. Recently, on a case filed by the Narmada Dharna Grast Samiti the district court has granted a stay on the felling of the forests. It may be recalled that the clearing of the forests by the Maharashtra government was frowned upon both by the environment ministry as well as the World Bank. What is most piquant about the current situation is that the clearing of these forests in the catchment area of the Ukai dam on Tapi river, apart from damaging the livelihood of villagers around, will also lead to increased siltation in the dam. Siltation, which is already very high in this dam, drastically reduces the holding capacity of the dam, thus making a mockery of the cost-benefit analysis—even the conventional ones which take no account of the social cost—of the dam systems. There's a hole in the bucket, Dear Liza!

WEST BENGAL

Inauspicious Beginning

HOWEVER impressive its electoral victory, the West Bengal Left Front's beginning of the fourth term in office has been far from auspicious. It was more than symbolic that the inauguration of the new council of ministers on June 25 coincided with a massive power shortfall, or load shedding to go by the local terminology, which got even worse the next day. It was followed within a week by a total collapse of the power supply system all over the state, except for the quantity generated by the Calcutta Electric Supply Corporation (CESC), which is inadequate even for its own commitments and has to be augmented by the state-run power grid. As a result, the total upset in the districts apart, there was a very serious disruption of life in the vast Calcutta conurbation affecting water supply, tram and rail transport, work in hospitals, AIR, Door-darshan and so on. Most dangerous of all its consequences, a large contingent of coal-miners was trapped deep underground for a long time, which could have ended in a grim tragedy.

The inauguration of the new ministry was also accompanied by newspaper reports with tell-tale photographs of happily some isolated, cases of atrocities on Congress supporters in rural areas—cases involving hacking off of hands in one case, apart from a few outright murders

These developments dimming the left front image were accompanied by rumblings within two of the major Left Front parties. For the first time communists were reported to have fallen out over the distribution of loaves and fishes of office when some members of the state committee secretariat of the CPI threatened resignation on the issue of the dropping of a former ministerial appointee of the party in favour of a new face. But hell really was let loose when two of the Forward Bloc ministers were replaced by new entrants. Not content with threatening a party split, the dissidents even organised a public bandh in the home-town of one of the replaced ministers.

While the power supply debacle, a technological failure, however, inconvenient to the public, may still be leniently viewed, the lack of consideration on the part of the administration reflected in the illumination of the main state secretariat as part of the celebration of the new government's installation, despite the black out all around, was a demonstration of shocking insensitivity.

More reprehensible was, perhaps, the government's, and the CPI(M) state leadership's, apathetic response to the post poll violence by its supporters in some rural areas. These incidents may not have been one-sided affairs and isolated from the social tensions in the country side. But photographs of the victims' households and the miserable pots and pans looted therefrom (and later reported to have been recovered by the police) make it quite clear that these were conflicts within the lower rungs of the rural society which, to use Marxist idioms, should have been viewed as contradictions among the people themselves. Still the Left Front leadership made no positive move in relation to these incidents till the time when Mamata Banerji had gone to seek Ivori Basu's blessings for her new ministerial career, when the chief minister for the first time deprecated these clashes and promised to secure artificial limbs from Chandigarh for the handicapped victims.

Dazzled by its unquestioned successes, the Left Front and the CPI(M) cannot afford to underestimate the gravity of the overall situation which demands utmost vigilance over all its responses.

PULSES

Not for the People

THE news that Indian scientists have at long last developed a hybrid pigeonpea plant must certainly be acknowledged as among those developments in science

which if put to correct use could restore some semblance of balance in the diet of the poorest. But that would be wishful thinking. In fact, this particular feat is a good illustration to demonstrate the hollowness of the 'science for development' myth.

There can be no denying the need to raise the output of pulses in the country, especially 'tur' with its high protein content, and a high yielding hybrid is just the right answer. As of now India produces 10 million tonnes of pulses while the demand is 14 million tonnes. The area under pulses has remained stagnant at 23 million hectares and production has gone up by a mere 0.34 per cent between 1947 and 1987. The per capita availability is only 33 gm against a nutritionally adequate level of 80 gm. In fact the per capita consumption of pulses has gone down since the fifties, which is hardly surprising given the rising price of pulses which shot up by over 560 per cent in a period of 10 years after 1977. This means that what was at one time considered a cheap source of protein in Indian diet is no longer either cheap or even easily available.

But, clearly, this is not the major concern of those who determine how the hybrid variety will be put to use. Dishearteningly enough, even the IC RISAT in its press note has viewed the new development as an opportunity to agricultural scientists and to companies to provide hybrid seeds to farmers. FICCI promptly took up the refrain suggesting that the entire process of commercialisation of the new varieties be put into the hands of private companies many of whom are already established names in the farm sector or are diversifying into it. It has further suggested that since there are so few countries which produce 'tur' the export potential of the commodity be exploited. Even though this might prove to be something of a mirage—for there are not likely to be very many countries which consume this pulse in enough quantities to necessitate large scale imports—that this new variety could be used to improve diets of the poor in this country does not seem to have crossed the minds of either the commercial interests or, sadly enough, even the scientists.

In sum, even if pulse production in the country goes up because of the hybrid variety, there is no guarantee that this will be available to the poor. Instead it will have added a new dimension to commodity transactions and provided food for thought for agricultural scientists. What is needed obviously is some sort of price regulatory mechanism as well as a

distribution network which ensures that pulses are indeed available to those to whom this is the main source of protein.

REGIONAL NUCLEAR FREE ZONE Worth Serious Consideration

PAKISTAN has been periodically proposing a South Asian Nuclear Weapons Free Zone (NWFZ) and India has with equal regularity been rejecting it. Independent of the Pakistani proposal India has been proposing various agreements, the most important of which was the 1988 Action Plan for Disarmament which sought a five-nation consensus aimed at establishing a non-proliferation regime for the region. The end result has been that there has been very little movement on this front.

This is rather unfortunate, especially given that the geo-political situation has changed considerably over the years. The signing of the IMF treaty and the success of the South Pacific Nuclear Free Zone Treaty together with the *detente* between the superpowers and the dismantling of the European defence alliances have not only given rise to a different, more optimistic mood internationally, but, more practically, have compelled the evolving of verification procedures which facilitate the triggering of other arms control regimes. Most importantly, India and Pakistan have only recently signed a no-attack on nuclear facilities agreement which, even though it has not quite got off the ground, is a major first step. In the circumstances India's summary rejection of the NWFZ proposal on the ground that given the reach of nuclear weapons, the value of such an agreement is illusory, is outdated. While it is true that without adequate safeguards, for which perhaps no effective mechanisms have yet been evolved, it does not constitute a fool-proof ban on nuclear arms programmes, the regional NWFZ acts as a 'braking' mechanism on nuclear competition in the region and as a sort of model. And the establishment of such a zone would imply a limit, however infinitesimal, on the superpowers' role in the region. India's position on the issue betrays its unwillingness to accept any restraint, even if it be reciprocated by Pakistan, on its nuclear programme. The result is a dangerous and unaffordable regional nuclear race.

SOVIET UNION

Advice but Little Aid

WHEN Mikhail Gorbachev took to mendacity on behalf of his country he must

have hoped that the west would rush to his assistance to bail the Soviet Union out of the economic crisis he had pushed it into. He did manage to have his plea heard at the G-7 summit in London last week, but returned home with the standard message from the rich, that he must first put his house in order.

Gorbachev's pleas, despite his promises (to privatise 80 per cent of retail trade) and threats (that the failure of the west to respond would result in social chaos that would jeopardise the process of 'democratic transformation' that he had begun), had little influence on the G-7. The G-7 statement merely endorsed the already publicised prescriptions of the US secretary of state. The statement called for "monetary discipline and creating the framework of a market economy"; reductions in military expenditure and public spending and a clear division of power—economic and political—between the Soviet republics and Moscow.

The summit statement apart, contradictory pronouncements have been emerging from the G-7 capitals. At the very outset, the United States was lukewarm about the whole idea while the Japanese government openly opposed the invitation on the ground that no talk of assistance was possible until Japan had resolved its territorial disputes with the Soviet Union and the Soviet Union reduced its military expenditure in the Asian republics. The United States and the United Kingdom are also unequivocal about not extending economic assistance to the Soviet Union until their prescriptions are carried out, while France, Germany and Italy are of the view that some form of direct assistance should be made available.

This last point is closely related to the relative health of the G-7 economies and their limited sectional interests. The US and the UK are in recession and have been dominated by trade and budgetary deficits. Germany is preoccupied with its recently acquired domestic commitments. France and Italy on their own are not in a position to meet more than a small part of the Soviet demands. Japan is the only G-7 member with a relatively comfortable liquidity position but is obviously happier investing it within the OECA and in the 'market friendly' countries of Asia.

There is little doubt that the west is not in a position to meet the Soviet demands. It also does not, however, want to outright turn them down and thereby jeopardise the pace of changes in the economic system. With no guarantees that economic assistance will be forthcoming with progressive shifts towards the market, some section of the Soviet leadership may use this as an opportunity to act differently.

TWENTY YEARS AGO

EPW, July 17, 1971

Cool calculation and calm assessment lie behind the announcement of the Nixon visit to China which has dramatised the *detente* in Sino-American relations, in the making for a long time... America's withdrawal from Vietnam has become inevitable due to the NLF's firm political hold over large sections of the South Vietnamese population and also due to the undoubted military prowess of the Vietcong and the North Vietnamese, especially when compared to the military and political blunders habitually committed by the Americans. The Chinese have probably also agreed to the timing of this announcement due to a concern about Vietnam. Their concern is likely to have been that an American withdrawal achieved largely by the Vietnamese themselves would leave China without much influence in Vietnam or in the rest of Indo-China... But while the Chinese are undoubtedly helping Nixon to pull his chestnuts out of the Vietnamese fire and at the same time helping themselves retain their influence in Indo-China, they are much more concerned about their position in the world as a whole, particularly *vis-a-vis* the US and the USSR.

The inference to be drawn by nations other than the superpowers is that the rules of the game in the emerging triangular relationship of the three big powers... will allow lesser nations a greater degree of freedom of action *vis-a-vis* other nations of the same status. For India, this means that we will more easily be able to take diplomatic and other initiatives with countries like Pakistan without too much interference from any of the big powers.

* * *

What dismays one most as one looks back on the two years since [bank] nationalisation is the way the banks have been left to operate in a virtual vacuum. There is no overall plan, however sketchy, to guide their operations—whether it be in allocation. To those who knew enough to discount the political clap-trap about ushering in socialism, the most compelling argument in support of nationalisation of the banks was that it would improve the quality of planning of the economy by completing the government's control over the major institutional sources of investment finance. But as things have turned out, it is precisely to this vital objective of nationalisation that the least attention has been paid.

Setting the Pace in Aluminium

Kumaran Pola

HINDALCO INDUSTRIES, one of the largest manufacturers of aluminium in the country, achieved a production of 1,39,762 tonnes of primary metal and 36,414 tonnes of rolled and extrusion products during the year ended March 31, 1991. The company expanded its installed capacity for aluminium metal from 1.35 lakh tonnes to 1.50 lakh tonnes during the year. An application was made to the government to grant an increase in licensed capacity by 1.5 lakh tonnes to take the total licensed capacity to 3 lakh tonnes. The techno-economic considerations for putting up a 1.5 lakh tonne per annum capacity smelter were examined and found acceptable. Work on the installation of another cold rolling mill is under way. The company continues to import new technologies and absorb them. For instance, the 'seed washing system' for the alumina plant was imported and absorbed in 1989-90. The company is currently implementing the absorption programme of the imported technology for modernisa-

tion of finishing facilities in the rolling mills.

The company spent Rs 23 lakh on R and D during 1990-91 by way of recurring expenditure. This represented 0.03 per cent of the company's total turnover. The company continued its efforts for improving the existing production process and developing aluminium uses with a potential for energy and wood saving. Pollution control is another area receiving attention.

The company's entry into the international aluminium market during 1988-89 helped it build up a sizeable market for its products in south-east Asia, west Asia and Germany. Government permitted export of aluminium ingots on a decontrolled basis from October 1990. This measure and the company's success in exporting its semi-fabricated products to west European and other markets enabled Hindalco to more than treble its exports in 1990-91. The value of exports was Rs 12.10 crore during 1990-91 as against Rs 3.73 crore in the preceding year.

However, the international price has dropped drastically and Indian aluminium manufacturers are not able to compete in the international market. The aluminium industry has been pleading for increase in CCS which now stands suspended. Despite the good performance on the export front, foreign exchange expenditure at Rs 18.75 crore during 1990-91 exceeded foreign exchange earnings at Rs 12.11 crore.

The company intends to diversify into steel. It is pursuing its application for a licence to set up a one million tonne steel plant for the manufacture of hot rolled products. It is going ahead with its project for setting up an aluminium foil plant with a capacity of 5,000 tonnes per annum at Jagdishpur in Uttar Pradesh.

The company experienced a setback in its financial performance. The overall return on investment was marked down to 10.34 per cent from 12.89 per cent in the preceding year. The deterioration in the assets utilisation ratio from 0.73:1 in 1989-90 to 0.82:1 in 1990-91 and in the net profit margin on sales from 13.84 per cent to 12.56 per cent depressed the return on investment. The return on owner's equity showed a similar decline. Although the company could bring down the debt/equity ratio from 0.96:1 to 0.69:1, it failed in holding the interest coverage ratio which declined to 4.21 in 1990-91 from 6.55 in the preceding year. The change in the capital structure was due to the conversion of partly convertible debentures at a premium. There was an addition of Rs 20.92 crore to equity capital and Rs 86.78 crore to reserves during the year.

The Week's Companies

(Rs in lakh)

| Financial Indicators | HINDALCO Industries | | FGP | | Indian Aluminium | |
|---|---------------------|---------------|---------------|---------------|------------------|---------------|

Balance Sheet Analysis by Manisha C. Mehta

year and the interest coverage ratio declined from 5.18 times to 3.09 times. The increased debt was in the form of bank overdrafts.

The company has technical collaboration agreements to continue the assimilation of the latest technology from Owens-Corning Fibreglass Corporation, USA, with which continuous interaction is maintained. The company has a similar link-up with Pilkington, UK. The company imported continuous filament manufacturing product technology during 1989. The technology was partially absorbed during 1990-91 and the work is still in progress. The company spent Rs 12.87 lakh on R and D during the year by way of recurring expenditure. This represented 0.39 per cent of the company's total turnover.

The directors are happy that the company had a better year in exports with the export turnover increasing to Rs 2.27 crore from Rs 1.66 crore in the preceding year. Foreign exchange earnings and outgo amounted to Rs 2.28 crore and Rs 2.89 crore, respectively, during 1990-91.

The company achieved a reduction in electricity consumption per tonne of glass fibre products from 2,504 KW during 1989-90 to 2,425 KW during 1990-91. However, consumption per tonne of LSHS and furnace oil went up from 656 kgs to 669 kgs and that of L.P. gas from 482 kgs to 502 kgs during the period.

INDIAN ALUMINIUM

Cost Spiral

INDIAN ALUMINIUM COMPANY recorded a nominal 4 per cent growth in sales but a 5 per cent decline in operating profits and a 12 per cent decline in net profits during the year ended March 31, 1991. All the indicators of operational efficiency such as turnover ratio, net profit margin on sales, overall return on investment and return on shareholders' equity experienced a set back during the year. According to the directors, profitability was affected by two major factors: first, the export price of alumina fell by \$ 200 per tonne and this brought down export profits, and second, there was a 53 per cent increase in the power tariff at the Belgaum smelter from October 1990. Raw material cost increased by 11 per cent and employees cost by 17 per cent as a result of long-term wage settlements at some locations and enhancement of retirement benefits.

Production of aluminium (primary metal) was lower at 64,769 tonnes during 1990-91 compared to 66,459 tonnes during the preceding year. On the other hand, there was a marginal increase in the production of semi-fabricated aluminium from 67,066 tonnes in 1989-90 to 69,027 tonnes in the latest year.

The total value of the company's exports at Rs 50.5 crore was lower than Rs 69.4 crore achieved during 1989-90. According to the directors, this was the result of decline in global alumina prices and the lack of repeat orders for alumina from the USSR. However, exports of value added semi-fabricated products nearly tripled over last year's levels to reach 4,500 tonnes of a value of Rs 19.7 crore. The company was awarded the Capexul trophy for export performance for the fourth consecutive year. The company brought in net foreign exchange to the tune of Rs 21.5 crore earnings on account of exports and canvassing agency fees, etc, being Rs 50.8 crore and expenditure on account of imports, dividends, etc, Rs 29.3 crore.

The company made progress in the im-

plementation of various projects. The 77.5 MW Hirakud power project progressed well. The Belur cold rolling replacement-cum-modernisation and the Kalwa foil converting modernisation projects also made progress. The company has decided to expand the annual capacity of the alumina plant at Belgaum from 1,70,000 tonnes to 2,20,000 tonnes to meet future growth in export and domestic demand.

Total expenditure on R and D amounted to Rs 299 lakh during 1990-91 compared to Rs 229 lakh during the preceding year. The company completed the absorption of the technology imported for printed circuit boards in 1987 and advanced technology for sheet and foil rolling in 1989-90.

CAPITAL MARKET

G M Mittal Stainless Steels

G M MITTAL STAINLESS STEELS, a profit making and dividend paying company, will enter the capital market on August 1 with a public issue of 84,618 (14 per cent) fully convertible debentures of Rs 250 each for cash at par. The issue is for Rs 6 crore out of which Rs 1.59 crore worth debentures will be issued to existing shareholders in the ratio 10 debentures for every 100 equity shares and debentures worth Rs 0.29 crore to employees including Indian working Directors on a preferential basis. The issue will close on August 12 or earlier but not earlier than August 5. Each debenture of Rs 250 will be converted into 10 equity shares of Rs 10 each at a premium of Rs 15 each at the expiry of six months from the date of allotment or on March 31, 1992 whichever is earlier. Incorporated in 1980 as a private limited company and converted into a public limited company in 1986, the company has a licensed capacity to manufacture 30,000 tonnes of alloy steel castings per annum. The company is implementing a modernisation scheme to improve yield and product quality by replacing its existing ingot casting by continuous casting. The company also plans to install two FOT cranes with capacities of 40/15 tonnes and 25/10 tonnes and a 1000 KVA O.G. set. The modernisation scheme involves a capital expenditure of Rs 7.10 crore. This will be financed by term loans from financial institutions to the extent of Rs 5.25 crore and the fully convertible right debentures amounting to Rs 1.85 crore. In addition, the company is also raising funds for long term working capital (Rs 3.62 crore), normal capital expenditure (Rs 0.53 crore) and expenses for the public issue (Rs 0.40 crore). This will be financed by the balance of the rights issue of Rs 1.92

crore, public issue of Rs 1.23 crore and internal accruals of Rs 0.40 crore. The sales and other income of the company in the year to March 1991 touched Rs 33.75 crore. The company earned a profit before tax of Rs 0.74 crore and paid a dividend of 20 per cent. The equity shares of the company are currently quoted at Rs 33 on the Bombay stock exchange. Earning per share works out at Rs 4.92 and the price earning ratio at 6.70.

Sree Kailas Sugars and Chemicals

SREE KAILAS SUGARS AND CHEMICALS is entering the capital market with a public issue of 63,00,000 equity shares of Rs 10 each at par. Out of this 5,60,000 equity shares are reserved for preferential allotment to the employees including Indian working directors of the company. The issue opens on August 7. The company is setting up a 2500 TCD sugar mill to manufacture white crystal sugar. The company also holds licences for alcohol and alcohol based chemical units which are proposed to be set up subsequently. The project is located at Peruvancha village in Khammam district of Andhra Pradesh, a B category backward area about 82 kms from Vijayawada. The project is in an advanced stage of implementation. The civil works will be completed by the end of October. Plant and machinery have arrived at the site and the erection work is expected to be completed by first week of November as per schedule. The project cost of Rs 28 crore is being financed by term loans of Rs 16.80 crore and equity share capital of Rs 11.20 crore. Out of this the promoters have contributed Rs 4.90 crore and the balance of Rs 6.30 crore is being offered to the public. The equity shares of the company will be listed on the Hyderabad and Bombay stock exchanges.

IMF Borrowings: Some Myths Exposed

Arun Ghosh

We are bending to international pressure to radically alter our economic system with a suddenness (and in a direction) which may lead to a large number of closures and increased unemployment, with doubtful gains in regard to productivity. Is there no alternative?

THERE is nothing wrong in a country—having temporary balance of payments difficulties—borrowing from the IMF. After all, that was the rationale behind setting up this institution at the Bretton Woods Conference in 1944. India has also, in the past, borrowed on a number of occasions and duly repaid such borrowings. Indeed, even as of today, India is a net borrower from the IMF, and is required to repay its past borrowings. (In fact, India borrowed an amount of \$ 1.8 billion fairly recently.) In the absence of the *Economic Survey*, it is not possible to indicate the precise figures for 1990-91 in regard to our current as well as capital liabilities—nor even the immediate compulsions facing this country in regard to external payments—but, as per the Reserve Bank of India *Bulletin* of July 1991, India's borrowings from/payments abroad, during the past three years, were as given in Table 1.

Two points which are significant must be noted at this juncture because—in a somewhat strangely inexplicable statement—the finance minister has recently blamed the National Front government for the present problems faced by the country, while the governor of the Reserve Bank had publicly stated in Calcutta on May 7 (reported in *The Economic Times* of May 8) that India's present crisis has been building up slowly over the past decade.

The two points of note are: (a) that India has lately resorted to short-term commercial borrowing on a large scale, which jumped from a gross figure of Rs 1,946 crore in 1987-88 to Rs 4,265 crore in 1988-89 and Rs 4,238 crore in 1989-90; and (b) that non-resident deposits which are also of a short-term nature, and which had been increasing in the past, had started tapering off, in 1989-90. Nonetheless, of the total receipts on capital account (which were Rs 7,493 crore in 1987-88, Rs 10,305 crore in 1988-89 and Rs 10,431 crore in 1989-90) *net short-term borrowings* (i.e. net commercial credits

than 39 per cent in 1987-88 (Rs 3,123 crore); more than 50 per cent in 1988-89 (Rs 5,208 crore); and nearly 49 per cent in 1989-90 (Rs 5,041 crore).

In other words, during 1988-89 and 1989-90—the last two years of the Seventh Plan, in the Rajiv Gandhi era—the Indian economy became heavily dependent on short-term commercial borrowing from abroad. In reply to a question in parliament, it was stated recently that in 1991-92, the principal amount repayable for loans contracted abroad would be Rs 2,605 crore, while the interest payment would amount to Rs 2,002 crore—or a total debt repayment liability of Rs 4,607 crore. This amount of repayment liability was not incurred overnight; it has been the result of a long period of improvidence and irresponsible fiscal management.

In part, this order of liability was due to the increasing fiscal deficit of the government of India and, in part, due to the programme of import liberalisation (both on commercial account and for imports by the government). While during the Sixth Plan period the gap between gross domestic capital formation and gross domestic saving was 1.4 per cent of

the GDP (on an average), the picture changed dramatically in the Seventh Plan period, as Table 2 would show.

One can therefore justifiably say that the growth rate of 5.6 per cent during the Seventh Plan was achieved by mortgaging the future. To repeat, dependence on external savings jumped suddenly from Rs 6.8 billion in 1987-88 to Rs 11.1 billion in 1988-89 and, even as a percentage of the GDP, from 2.1 per cent to 2.9 per cent. On a weighted average basis, the dependence on external saving during the Seventh Plan increased to 2.5 per cent of GDP (as compared to 1.4 per cent in the Sixth Plan period).

So far, we have cited official figures of the balance of payments (as well as the gap in domestic savings in relation to GDP). Similar estimates for 1990-91 are not available, but DGC and S figures of trade (excluding most government imports) are. These are briefly indicated in Table 3.

One must add that of the total increase in the value of imports during 1990-91 amounting to Rs 4,846 crore, as much as Rs 4,546 crore was due to increased import of petroleum, oil and lubricants (POL). However, one must also add that not all this increase has arisen because of increase in import prices of oil; the quantities of import also increased significantly—despite increase in prices—because we have not been able to clamp down either conservation or substitution measures adequately (e.g. petrol products by natural gas and coal). The import (in quantitative terms) of both crude oil as well as of oil products increased significantly, as the figures in Table 4 would indicate.

It would be seen that diesel oil imports increased by more than 30 per cent, which

TABLE 1: INDIA'S BALANCE OF PAYMENTS—CAPITAL ACCOUNT

| | (Rs crore) | | |

reflects, in a way, the failure of the railways to meet the need for increased long distance movement of goods and passengers. And since, even where trains are hauled by diesel driven locomotives, the per tonne/km or per passenger/km consumption of diesel oil is a fraction of the consumption by trucks and buses, it is obvious that our authorities have not yet woken up to the need for improved railway services—through containerisation, door to door delivery, speed, safety, and easier booking and delivery facilities, etc. Nor has there been any progress in the move towards the use of natural gas in lieu of diesel oil, through installation of the dual-fuel motive power system between centres having natural gas, e.g. Bombay-Surat, Baroda-Ahmedabad and along the HBJ pipeline from which short 'spurs' can be taken for traffic between important towns on the way. (The theoretical possibilities of the system, which can save up to 70 per cent of diesel oil, have not only been demonstrated in India, the system is fully operational in several countries.)

The other important point that emerges from Table 3 is that in April 1991 we had actually achieved a surplus on merchandise trade account. Doubtless, this became possible through a drastic cut in imports, part of which cannot be sustained without hurting our production structure or our exports. But the point that gets firmly established is that there is considerable fat in our imports as of today as well as considerable potential for promoting exports intelligently. In addition, there is also considerable potential for saving in government imports (which do not get recorded in DGCIS data) comprising defence imports, imports of civilian aircraft, and ships, etc.

The crisis today, contrary to what the finance minister has stated, arises from: (a) a crisis in confidence of the short-term lenders on whom we had come to rely heavily from 1987-88 onwards; and (b) a crunch in the availability of foreign exchange to meet the repayment liabilities that arise from one month to the next.

It is in this context that it is relevant to note that it is the government which has been crying 'wolf' for quite some time, scaring away both the NRIs and the other lenders. In the medium and longer term, the situation is not one which cannot be retrieved by disciplined action to save on inessential imports and a steadfast approach towards export promotion. That is the background.

Let us now examine the latest situation, the *sequence of events* since the present government came to power, and the implications of the economic reform package which seems to be in the offing. Let it be stated at the outset that the sequence of events is all wrong, that we

have already played into the hands of the IMF/World Bank experts who have a *theology* that market forces alone can lead to the optimal development of an economy—a theory based on wrong premises, a wrong interpretation of the development programme adopted by the present Asian giants like Japan and South Korea—a theology which presumes a minimum of education and income and therefore the semblance of a reasonable expression of consumer choice and market competition, as well as increasing efficiency and productivity of the system.

What is the sequence of events in India over the past fortnight? India devalues by 10 per cent; and then, under pressure from the IMF/World Bank, by another 10 per cent within three days. (Remember in this context the recommendation of the World Bank report on trade reform in India which recommended devaluation by 20 per cent.)

The next step was reform of the export/import trade regime. In a sweeping set of reforms, all Cash Compensatory Support (CCS) has been abolished, a 30 per cent REP entitlement (which is to be tradeable) has been granted to *all* exports, Actual User (AU) imports have been virtually abolished (except for some items which are yet to be specified), many OGL imports have similarly been abolished, and both these categories directed to buy import entitlements from exporters in order to meet their import requirements.

It is perhaps presumed that these two reforms, *plus* the promise of a budget seeking to bring down the fiscal deficit, would get the IMF to allow the interim upper tranche loan of \$ 2 billion, with further instalments of a large loan of \$ 5 to 7 billion (under the Extended Fund Facility for structural adjustment) to be made available in instalments, as India makes further sweeping changes in industrial policy, in tariff policy, in abolishing all quantitative restrictions (QRs) on imports, bringing down the tariff on all goods (including consumer goods) to a flat rate of 20 per cent. This, briefly (and partially) is the reform package recommended in the World Bank report. Unfortunately, the consequences of this reform package are likely to be exactly the reverse of what is assumed. From a balance of payments deficit of some \$ 3 billion per annum, we are unlikely to achieve a surplus of this order—since the IMF loan would need to be repaid between three to seven years.

It is yet to be seen what the policies to be insisted on by the IMF are, for even the \$ 2 billion are yet to be released, and it is clear that the next steps taken by the government of India would hereafter be tailored to the dictates of the IMF. The portents are that industrial licensing would be abolished, the MRTP Act and

(the FERA would be amended, the latter to allow free inflow of foreign capital up to 51 per cent equity (except for a short negative list of industries involving consumer goods). That such facilities are already available to companies with up to 40 per cent foreign capital, with liberal approval of collaboration arrangements for the manufacture of soft drinks, potato chips and other consumer items, is a point which is forgotten. In fact, the surge in imports over the past few years has arisen specifically because of approval of collaboration arrangements for the manufacture of import intensive consumer goods, with no stipulation in regard to export of the products. We have of late spawned uneconomic industrial production which is import intensive and which can survive only under heavy protective barriers to import (QRs). This is most unfortunate; but one can presume that a lot of closures and unemployment will follow the reform package.

To go back, the sweeping changes in im-

TABLE 2: INDIA'S DEPENDENCE ON EXTERNAL SAVINGS

| | | (Rs billion) | | |
|---------|--|----------------------------------|------------------------|------------------|
| | Gross Domestic Product at Market Price | Gross Domestic Capital Formation | Gross Domestic Savings | External Savings |

port policy involve, among other things, a flat import entitlement of 30 per cent of the value of export, which would be tradable and which would therefore increase export profits. In principle, this appears to be a reasonable way of promoting exports. But today is it likely to work? For instance, should tea exports be entitled to the same REP facilities as the export of sophisticated engineering goods like machine tools and electrical equipment? Is tea production really price elastic? Could we not just raise excise duties for home consumption? The manufacturers of equipment may themselves need imports of raw materials (like non-ferrous metals, alloy steel)—which tea exporters do not need—as well as certain components which may not be available in the country or are not worth manufacturing in India.

The broad composition of our exports in the past couple of years should, in a way, illustrate this point and inform our policy on exports/imports. Table 5 is relevant in this context.

That the idea of a flat REP entitlement on all exports is misconceived would be patently clear from the composition of our exports and, more pertinently, the trend of exports (even though over one year). For instance, our export of naphtha is entirely due to the present surplus of this product, and the way the demand for motor spirit is increasing, and if we go in for fanciful aromatics projects (by cracking naphtha), we would be deficit in this item. Gems and jewellery would in any case require a much higher REP entitlement, our imports in the two years being Rs 4,242 crore in 1989-90 and Rs 3,732 crore in 1990-91 or 81 per cent of exports in 1989-90 and 73 per cent in 1990-91. And do we want to export raw cotton rather than cotton manufactures?

Equally, do we need the REP entitlement for the export of ores and minerals? The small-scale manufacturers/exporters of garments have already represented that they always quote in rupee terms and so the devaluation of the rupee is going to affect them adversely.

In short, it is possible, indeed likely, that for primary products, devaluation would turn the terms of trade against India, whereas a flat rate of REP entitlement, while a useful device in the long run, may become counter-productive in the short run, and be especially detrimental to engineering exports.

The devaluation of the Indian rupee is considered to be necessary. But by whom? If one leaves out bulk imports and export related imports, one is left with a relatively small segment of imports of machinery and components against free foreign exchange, and a large chunk of imports

against project aid (the latter amounting to as much as Rs 2,342 crore in 1990-91). Devaluation may have some impact on the former. On the other hand, if the associated part of the World Bank package, of a sharp reduction in import duties and the abolition of QRs is pursued, we would be truly in a mess. On exports, the terms of trade may move against us. On imports, devaluation will both raise prices in India (where imports are involved)—or reduce the profits of the oil companies if oil prices are not raised, and thereby accentuate the fiscal deficit—and not inhibit project imports since they are all against 'tied' credits. In fact, the only effect would be to raise project costs and increase the fiscal deficit.

THE ALTERNATIVE

What is the alternative? Of course, a reduction in the budgetary deficit of the centre is a must. But this should have preceded all other policy changes. As of today, this could and should be achieved in a manner calculated not to hurt the economy, and can still be achieved in the following manner:

first, by holding expenditure on defence, and gradually reducing it, through diplomatic negotiations, and a reduction in the arms race between India and Pakistan,

second, by holding expenditure on internal security and reducing it gradually, in either case, there will be a reduction in expenditure (on defence and internal security) as a percentage of the GDP, and hopefully, even in terms of actuals in the future,

third, by economy in the delivery of services by decentralisation, making the local bodies (locally elected panchayats and municipalities) responsible for local area development rather than through central schemes and Centrally Sponsored Schemes,

fourth, by reducing the many covert and some part of the overt subsidies (which today benefit the affluent) and *targeting* the latter among the poor,

fifth, by improving the performance of public sector enterprises (PSEs) and making it clear that they cannot rely on budgetary subsidies and that they can expect to be paid only on the basis of the 'value added' by them, in suitable cases, the management can be handed over to the workers—as in the case of the Kamani Engineering Company—by restructuring their capital and giving workers loans to contribute to equity, the workers on their part having to accept a cut/freeze on their emoluments. The sale of a part of the equity of all PSEs to workers and also to private parties—except for certain strategic sectors—should also be a part of this exercise because such sales will (a) en-

TABLE 5 BROAD PATTERN OF INDIA'S EXPORTS (Rs crore)

| Grand total (incl others) | 27,681 | 32,527 | (+) 17.5 |

these workers as partners in the production endeavour, (b) lead to greater openness and accountability of all PSEs, and (c) help to increase the distance (which should be brought about in any case) between government administration and the PSEs, prevent the patronage and misuse of PSEs by both politicians and bureaucrats, and encourage 'accountability' in the true sense of the word, through accountability for efficiency and profitability, providing for adequate disclosures through annual reports in regard to the functioning of the company in meetings of directors of whom some would also be from outside the government, as well as in the annual general meetings of shareholders (where all shareholders, including workers) would be present;

sixth, by raising direct taxes and also extending their coverage, as well as extending the coverage and extent of indirect taxes on items of elitist consumption thereby raising government revenues and making for more egalitarian taxation; the mere removal of the innumerable exemptions and 'costs' would help greatly in this direction;

seventh, by postponing all mega projects (and even deferring some of the long maturity prestigious projects of doubtful economic value); the large number of approved but as yet unstarted petrochemical projects fall in this category; and

finally, by equating, as rapidly as possible, the overall rates of domestic saving and domestic investment. This point needs special elaboration.

What is the greatest need of the country today? The provision of *gainful employment* to all and an *increase in the productivity of all workers* currently employed are a matter of the greatest urgency. Today only some 30 per cent of the cultivated area is irrigated. Of the 180 million hectares of cultivated area, more than 100 million hectares stand degraded. The people in these areas can barely take one crop in these rainfed degraded areas and live below the subsistence level.

Local area development, restoring the land back to its original productivity, would require massive investment in rural infrastructure. The moisture retention capacity of the soil needs to be improved; land levelling, contour bunding, tree planting, creation of small local irrigation facilities, all these activities would help, but they need the employment of manpower, under local supervision and local direction. An employment guarantee scheme can achieve this in rural areas. (In urban areas, such a scheme can help to improve urban infrastructure, and pave the way to greater integration of the villages with neighbouring towns.) But such a programme would call for: (a) large

THIRD WORLD *Economics* TRENDS & ANALYSIS

Economic News and Analysis — from the Third World's perspective

URUGUAY Round trade talks. Debt crisis. Structural adjustment. African economic collapse. Poverty and Inequality. TNC mergers, acquisitions and growing power. Global economic instability. Recession.

The big economic events of our times are overwhelmingly reported by the Western media. Mainly reflecting western interests and orthodox 'economic' approaches.

Now comes a new and unique fortnightly—covering economic and development events and trends from a Third World perspective. To fill in a long-felt vacuum.

Third World Economics—edited and published in the South, written mainly by Third World economists and researchers—gives you news and analyses that reflect the interests of Third World people.

Focus will be given to issues such as:

North-South Relations; The Uruguay Round & The South; Debt & Capital Flight; Trade, Commodity Prices & Instability; TNCs & Third World; National Development Strategies & Dilemmas; Poverty, Basic Needs, Inequalities; Economics & Ecology.

outlays of funds for several years, and (b) devolution of the required funds for such programmes must be locally directed.

Once the land is capable of giving, say, three crops in place of one, once horticulture, dairying, poultry keeping, etc, are encouraged, the need for the employment guarantee scheme would also gradually disappear. Industry and services would grow to process produce and to meet the demand of villagers.

So while subsidies are being reduced, *a minimum income should be guaranteed to all* so that there is no distress, no unfair sharing of the burden of the sacrifices the nation is required to make.

Such a procedure would also increase rural savings, induce direct investment in rural areas and help to equate overall savings in the economy to investment. That would automatically bring in macro-economic balance.

At the same time, because of the present skewed distribution of income in the country, we cannot give up import trade control (by way of QRs and high import duties) on elitist consumer oriented imports which are not essential for the development of the economy.

At the same time, the simplification of both the industrial licensing system as well as of the import control regime is desirable. These had become sources of corruption of both the politicians and the bureaucrats. While reform in both areas is necessary, as stated earlier, the reform needs to be well thought out, in tune with our needs and potential. One needs to proceed more slowly and judiciously. To repeat, one need not make a flat rate of REP available to all exporters. That will only turn the terms of trade against us, as well as lead to closures of industry and unemployment. There is need for both finesse and careful calibration in this regard, for a flat rate of REP is an additional devaluation, implying only a multiple exchange rate, one for exports the other for imports. Apart from the problems cited earlier, it would lead to pressure on the exchange rate through 'invisibles', and thereby adversely affect capital inflow. The justification for REP licensing is different and must be accepted; the REP rate should not be the same for all exports. Reform must also be not only gradual—as was the case with partial decontrol of cement, reducing the percentage of 'levy cement' over a period of years—but carefully calibrated. What has happened is hasty and ill-conceived.

Equally, in regard to industrial licensing, there is little need for the present system. The extant licensing system can be scrapped except for: (a) a small list of reservations in favour of the small-scale producers (e.g., the handloom weavers); (b) a change in lending policies, making

for a lower debt: equity ratio for large industries, and making capital and credit accessible in adequate measure to the small producers at the same interest rate as to large producers—today the large borrowers pay 14 per cent interest rate to the IDBI while the handloom weaver has to pay 25 per cent or more to the village moneylender and this has to change and can change only by revitalisation and democratisation of the co-operative credit system; (c) giving teeth to the MRTP Commission in respect of 'anti-trust' measures as well as Restrictive (and Unfair) Trade Practices, breaking up oligopolistic price fixing; and (d) making FERA more effective by stipulating that all foreign investors (with equity, say, of more than 25 per cent) shall have a favourable balance in the matter of external payments. A multinational firm is normally expected to maximise its profits; and this can be done by 'transfer pricing' and locating profits in 'tax havens', of which there is a growing number. There is a proposal to allow foreign investment up to 51 per cent freely, except for a negative list. Instead, like China, why do we not merely insist on a favourable balance in external payments? Foreign investments should be welcome provided their total remittances (of profits, interest, as well as outgo for the import of raw materials and components) are, say, 50 per cent (or some such percentage) of the export of their products. This should be insisted on except where we ourselves negotiate for the inflow of foreign investment for upgrading technology in a few selected directions. China is today getting foreign investment to the tune of some \$ 10 billion annually—the amount has been on the increase—on precisely the above conditions. Investors are attracted because of the large domestic market; and the wages are low enough to warrant profitable exports. Similar conditions exist in India, but we must make foreign investment advantageous not only to the foreign investor but also to us.

There are many other reforms which are necessary, but they cannot all be spelt out here. The question that arises is: why are we bending to international pressure to radically alter our economic system with a suddenness (and in a direction) which may lead to a large number of closures, and increased unemployment, with doubtful gains in regard to productivity? It seems we are in for a period of 'de industrialisation'.

The government spokesmen say that an IMF loan is a must to avert disaster. The worst disaster is a default. Suppose we were to announce that there shall be a *postponement* of the repayment of capital and interest for five years, and that we would resume repayments only after

restructuring our economy? Would our international reputation be any worse than it is today? Suppose we were to gradually introduce the reforms suggested above first putting our own house in order. What would happen? Did the UK ever repay the US for the debts incurred during the second world war? What is the position regarding commercial debts of Latin American countries? True, the White Man and the Black are different! But we would only be declaring a temporary moratorium making our export pay for our imports, increasing our exports so that we can pay for our past borrowings later, and meanwhile clamp down to put our own house in order and improve production. Incidentally, we are frequently paying 50 to 100 per cent more for project imports under 'tied aid'. Why should we be so chary of getting tough with those who have been taking us for a ride? What great reforms has China introduced that it is getting foreign investment to the tune of \$ 10 billion annually and getting kudos from *The Economist*, London? We should, of course, ensure that any surplus of exports over imports will be used, even within this five-year period, to repay, pro rata, the interest on past *private* loans first, and thereafter the interest on Official Development Assistance. It is the high interest short term borrowing in the recent past that is breaking our back; and these loans need to be partially written off and partially paid back. Let us reproduce what the IMI has to say on the Mexican financial package:

MEXICO formally initiated negotiations on multi year bank financing package in April 1989, preliminary agreement was reached with the bank advisory committee in July 1989 and the term sheet was issued in September. The package was completed in September 1990. As a result, bank debt amounting to \$ 7 billion was extinguished outright, while claims of \$ 23 billion were subjected to a below market rate of interest of 6.25 per cent. (See IMI, *International Capital Markets Developments and Prospects*, Washington, DC, May 1991).

We have an outstanding debt liability of \$ 70 billion today. We propose to incur additional liabilities on condition we reform our system to a point where we would become primarily exporters of primary products and importers of manufactured goods (including capital equipment). The World Bank report on trade reform gave some results of simulation exercises of what is likely to happen after seven years of reform provided we were to follow the bank-recommended reform package. Our manufacturing output would be stagnant; our machinery output would decline by anything between 10 and 16 per cent. Our minerals output (and obviously exports) would go up. I

this what this country wants to achieve? In conclusion, our endeavour should be:

- (a) to borrow as little as possible, something like \$ 2 billion, to meet immediate commitments;
- (b) to bring in our own reforms in our own way; and if this is not agreed to;
- (c) to threaten to openly postpone the repayment of past obligations and seek our own solutions on the lines suggested.

This country is large enough, its people resourceful enough, to get out of our present troubles, which have been forced on us by policies followed during the second half of the eighties, in the interest of some 100 million affluent Indians. The policies now being pursued are calculated to help only these same 100 million.

It is time that someone spoke up and agitated for the 750 million Indians who have been left out of this race for affluence; and certainly for the 350 million Indians who still exist below the poverty line.

The fate and the livelihood of these

people are more important than the so-called prestige of a 100 million Indians who would thereafter feel sheepish and unable to show their face to their friends in Washington, New York and London. We ought to seriously reconsider some of the policies already adopted. Devaluation is a fact; but the REP percentages can still be changed, with different groups of products having different entitlements. And while simplification of the industrial licensing system is necessary, we must not give up the objectives of: (a) industrialisation, and (b) employment-intensity in selected industries. Finally, while we must have greater fiscal discipline, that discipline must be brought about through cuts in defence and internal security expenditure and greater efficiency of developmental expenditures through decentralisation. We must have an employment guarantee scheme to revitalise our rural areas; and a minimum income, and higher productivity should be the touchstone of our policies. We need wise modulation of policy, not hasty, knee-jerk reactions of the type we have seen in the past couple of weeks.

Removal of political interference and bureaucratic control is essential, but even if these are removed, there is no guarantee that the institution will develop flexibility and adaptability to be a competitive and viable market player. Over the years the banks and financial institutions have been subjected to administrative directives, formal as well as informal, and have lost the will and capability to make their own business strategic decisions. Autonomy has to be understood in a much wider frame, which postulates that each unit has the operational capability and flexibility to take decisions to keep itself as a strong and viable institution geared to provide diverse products and services to its customers at competitive costs.

The Indian banking and financial systems have always adjusted prices to their costs. In the environment likely to emerge, a host of administrative issues relating to costs and profitability have to be tackled: the cost of intermediation, employee productivity, reduction in transaction processing costs, the cost-benefit of different types of financial services. There are far too many entrenched vested interests, who have a lot to lose if each unit is to restructure its operation to achieve internationally accepted standards of costs, efficiency and productivity.

No authority can fine-tune the policy package specific for each unit. What the policy-makers can, and should, do is to remove all negative hurdles and give positive support to each individual unit to enable it to function as a profit-oriented institution.

Institutions which are effective players in the market must promote integrity in the market place. This will be the most difficult thing to ensure in the Indian context.

The parameters of competition policy should allow for the encouragement of competitive forces and widening of the range of competitive play, but at the same time they must provide for adequate monitoring arrangements at the in-house level, at the level of any self-regulating organisation with responsibility for setting rules and precedents, and at the level of authorities. While the category of financial regulations which are anti-competitive in nature are progressively being diluted in most of the developed countries, there has emerged increasingly a compelling need in public interest for guarding the system against abuses and frauds for the protection of investors, borrowers, and other users of the financial system. Investors have a right to protection against undue risks or losses and damage that may arise from failures, malpractices, manipulations, and other bad conduct on the part of those who are offering the financial services. In recent years, the

POLICY FOOTNOTES

Financial Sector Reform: Enemy Within

D N Ghosh

There are grave doubts whether the financial services sector in India has the confidence and the credibility to implement any kind of reform package.

THE agenda for reforming the financial sector set by the IMF-World Bank aims to create a competitive environment, which will eliminate bureaucratic and political interference in the functioning of the system and allow market forces to benefit consumers of financial services.

Can we make the market regime workable? Of the several prerequisites for ensuring a smooth transition, the most critical are institutional capability and integrity in the financial sector. There are grave doubts whether the financial services sector in India has the confidence and credibility to implement any kind of reform package.

For most of the units in the financial sector, there is a thin protective veil over their weak financial strength, making them ill-equipped to face competition, far less to take advantage of any competitive opportunities in a deregulated climate. We face the stark reality today: either we make our banks and financial institutions strong enough to face competition or we

face the prospect of our domestic institutions being unable to grow in a climate of competitive pressures in the wake of freedom of entry for foreign financial agencies. We are coming to be driven to a situation which will allow little time for preparing a reasonably acceptable level playing ground. The outcome could be destabilising with unpredictable consequences for the political economy of the country. It will be tragic if we succumb to the authoritarian logic that there is no way out.

We have no time to lose. We have to give a mandate to each unit to achieve viability within a certain time-frame. Each unit will have to follow its own route, specifically devised by it on the basis of its financial position, strength and weakness of its asset-liability pattern, the market niche it has carved out for itself and its operational constraints. Each unit has to work out its own strategy on the basis of its perception of the competitive environment.

discussion on conflict of interest problems in banking and finance, which has a long history, notably in the US, has seen a considerable revival in a number of countries, such as Canada, France, Germany and the United Kingdom. The recent scandal in the Tokyo securities market, which forced the resignation of the chiefs of the two largest securities houses in Japan, brings out the fact that despite the very rapid development of the securities market, transactions are still done on a discretionary basis in an atmosphere and under conditions bordering on impropriety.

The three basic principles—the requirement of fair trading, the duty of skill, care and diligence, and the duty of disclosure of information—will meet with the stiffest resistance in the process of reforming the organisation and functioning of the financial market. The reluctance to reform is deeply ingrained in the structure of our financial industry. The relationship between big business and the financial industry is intertwined; the special cosy relationship helps generate and guarantee benefits which would not pass the test of ethics and fair play. These 'club arrangements' operate effectively to frustrate the regulatory efforts. The SEBI has continued to remain toothless for several years now. When impropriety exceeds the limit of public decency, resignations of chiefs of some institutions have been sought and obtained, but then these have all been symbolic gestures: a triumph of symbol over substance.

It is naive to think that efficient but clean business will come about automatically through market forces. The Tokyo scandal has provoked sharp comments from several financial journalists in the western press; they have no doubt found it handy to bash Japan for not adequately opening up the financial sector and assuring transparency and fairness in securities transactions. Read the following no-holds-barred observation of the *Asian Wall Street Journal* (June 26, 1991):

Certainly one lesson that Japan's state officials might extract both from their own experience and from that of their many over regulated neighbours in the Far East is that big bureaucracy does not promote integrity in the market place. Rather, it tends to breed a clique of entrenched interests favoured by the government machinery, and prone to assume they can get away with a fat measure of shady dealing. Thus did the Philippines' late president Marcos end up with his cronies, thus does India endure the monopolies run by a few big families, and thus does Japan to a milder degree today find itself embarrassed over the misdeeds of its big business groups. These business interests, in turn, tend to throw some of their muscle into thanking their patron bureaucrats vigorously enough to ensure that the flow of favours continues. Should anyone be shocked when it turns out that the improper back-room

payments have become standard procedure among the main dealers in the Japanese stock market?

A three-trillion dollar economy can brush off fleas on the thick hide of an ox, but can we?

Institutional integrity will turn out to be the main bottleneck towards a reform plan. Institutions cannot be reformed by fiat. Surviving competition in a highly volatile market involves a succession of decisions affecting every facet of a company's operation: in the matter of cost reduction, improvement of productivity,

modernising system and technology, insider trading, strict ethical standards to avoid conflicts of interest situations. Vested interests will be at stake at each stage and will bide their time to strike.

The specifics of the reform package may be formulated at the behest of the foreign aid-giving agencies, but its implementation is a matter of domestic politics. Politician-reformers at the national level may turn out to be stubborn politician-resistors at the grassroots level. Can they be won over? We can only wait and see.

POTOMAC MUSINGS

A Season of Mothers

Deena Khatkhate

Saddam may have lost the Gulf war, but when he called the war 'the mother of all battles' he conquered the English language. So many mothers have since sprouted all over.

IN this world of quick television sound bites one can see the ancient war in ancient India and the modern war in the modern world with different messages. Lord Krishna of Peter Brooke's *Mahabharat* is somberly chastising Americans and others in the western world that 'victory is defeat', but the vibrations from the modern Gulf war are different—for Saddam Hussein, defeat is victory. Saddam may have been defeated in the mundane vocabulary of the ordinary people, but he has conquered the English language. If you see on the television the shambles to which Iraq's hapless people have been reduced, the ashen faces of young babes and the wizened faces of the old, screaming mothers clutching morsels of food, slaking their thirst with foul drain water, holding their babies to their milkless breasts, and the hordes of defecting Saddam's army men with craven faces, hanging on to American soldiers' epaulets, begging for shelter, just ignore all this as the Americans' dissimulating pranks. Saddam Hussein has won a great victory through his defeat. He called his war with the allied forces "the mother of all battles". And as a result so many mothers have mushroomed all over, in the lingo of statesmen, journalists, scientists and factotums of the president of America.

The first to come in the aftermath of the Gulf war was the mother of all world orders. President Bush declared that the old order had ended and a new world order was being born through the midwifery of America. What is this new world order? Israelis and Arabs would be friends not foes, they would re-live the Old Testament; West Asia would be a zone of peace.

But wait a minute lest you get it all wrong. 'World order' is what you heard! No, in this society of political pluralism you talk only in plurals. It is not a new world order, but new world orders. Kuwait's reconstruction is on the agenda and the losses borne by Turkey and Egypt are heavy and need to be compensated. Orders for new goods and services will be there. But if the new world order is to be firmly and permanently in place, there should be new world orders for armaments and ammunition. Saddam Hussein's mother of battles may have perished, but the mother of all world orders for armaments has taken her place.

But what about a mother of all defeats? The leaderless, fatherless democrats cannot escape such a mother. Many democrats had stood up with courage against the despatching of GIs to the Gulf. They lost hopelessly and helplessly watched president Bush's electoral stock soaring sky-high during the war. The feedback from their constituencies was frightening. They tried to backtrack and put some gloss on their opposition. But the Republicans hammered away ruthlessly at the 'unpatriotism' of the Democrats. The Democratic party is not getting anyone to be a presidential candidate for the 1992 race. Everyone is chickening out. By not voting for the Gulf war, the Democrats fear losing votes in the 1992 elections. The mother of all defeats.

From the Desert Storm has emerged a new storm of political wheeling and dealing by ex-president Reagan and ex-vice president Bush in cahoot with their acolytes, CIA Cassey and co. Gary Sick, respected professor at the University of Columbia and former Carter aide, has

come out with the stinging charge that the officials in Reagan-Bush campaign had made a secret deal with Iran to delay the release of 52 US hostages until after the election. This has triggered an enquiry by the Congress. So the Democrats, poor souls, should not drown themselves in sorrow. Their mother of hopes, presidential hopes, is waking up from deep slumber; she is smiling.

Mother of all hopes, did you say? Yes, it is not only the mother of all hopes but a most fecund mother at that. Alan Friedman and Lionel Barber, of the *Financial Times*, have come up with a sensation. The Bush administration pushed through a \$1 billion loan guarantee to Iraq for exports before the invasion of Kuwait. And this despite the solid evidence available to the administration that Iraq had abused US funds with impunity, manipulated the US banking system illegally to fund its arms purchase programmes and collected generous kickbacks, including armoured trucks, as a part of the loan deal. All this was in defiance of the advice given by highly placed US government officials at the time. The Democrats have been blessed with a heaven-sent opportunity to transform their mother of defeats into a mother of presidential hopes. And to add to the glory of the Democrats' mother of hopes is what Robert Woodward, of Watergate fame, has revealed. Bush's war against Saddam Hussein was his own, not General Powell's, not Jim Baker's, not even Dick Cheney's. The Gulf war was, oh, a mother of Bush.

The mother of all Bushes is perhaps the right description. The other day Bush was celebrating his great victory at a gathering. A wag asked him, "What role did Barbara Bush play in the conduct of the war?" With a coast-to-coast smile and his usual distorted syntax, the president said, "she is a mother of all Bushes". For Indians who are used to Indira Gandhi being the mother of all Gandhis this may sound rather jejune, but not in this society. The mother of all Bushes must have brought into this world the best of all children. But newspapers are naughty; they flashed the news the next day that Neil Bush, one of the sons of the mother of all Bushes, was reprimanded by the superior court for his conflict of interest entanglement in a fraudulent savings and loans association.

This season mothers are everywhere. And here comes the mother of all deceptions. She is everywhere, dominating everyone around her and, shall we say, destroying them all in the process—one thing which Saddam Hussein's mother of all battles could not do. There is a sordid story making the rounds in cocktail circles for the last five years, though nothing

emerged until recently. There is a small computer software firm, Inslaw, which signed a contract with the federal government in 1982 to supply all 94 US attorneys' offices with software which it had developed. In early 1984, the government terminated the agreement and Inslaw as a result slid into bankruptcy. The company went to court, charging the government with stealing its property and software "by trickery, fraud and deceit". In subsequent appeals, the attorney general's office brought pressure on court judges and, by various machinations, thwarted Inslaw from getting justice. But the firm did not let up and has now convinced the House Judiciary Committee that it should see through every document connected with its plea. Many heads may roll as a result.

But this is one mother of deception, there are two others. Bush's chief of staff Sununu had made 90 trips in the public interest, using government transport and money to visit his dentist in Boston and play golf in New Hampshire. When asked, the president justified all this by saying that he needed to have "voice contact" with Sununu when he was away. But Sununu could not get away with this. His minions, to whom he had denied these goodies, have blown the whistle. Shenanigans amongst Bush's coterie are now seeing the light of the day. The disease has spread fast. Robert Clarke, the controller of the currency, is found to have indulged in conflict of interest transactions. Asked about this impropriety, his answer, like that of all honest men till they are found to be dishonest, is that "according to his interpretation of the rules, his act was permitted". Even the hallowed educational institutions have not escaped the mother of all deceptions. A congressional investigation committee has identified several educational institutions such as Stanford, Harvard, Yale and a whole lot of others as having fudged the aid given to them to cover expenses which were extraneous to the purpose for which it was given. Most of the culprits are Ivy League colleges. Only two state universities are amongst them. Money has been spent on interesting projects. Cornell University had billed thousands of dollars for executive jet services for its president, Frank Rhodes. If you want an explanation, here it is: the president is a tall man and just is uncomfortable in commercial airplanes.

In the midst of all these too many mothers—mother of all battles, mother of all world orders, mother of all deceptions—one is confused about which one to love. But this is not a new predicament here. There are different kinds of mothers—biological mothers, step-mothers, live-in mothers, surrogate

mothers and casual mothers. Yet a riddle remains. A mother of battles? A mother of deceptions? But why not a father of battles? One is not only naive but also a backward walker in the terrain of knowledge. Invoking mother and not father was a stroke of a genius in this epoch of fatherless children who can be manufactured through IVF.

RELEASED FOR THE FIRST TIME

Selected Works of Mao Tse Tung - Vol. VI

As Foreign Language Press, Peking abandoned the publication of Mao's Works, Kranti Prachuranalu has taken up the task of bringing out all the other available works of Mao Tse Tung, published elsewhere in Volume VI. This is the first of its kind and forms part of the CPC's authentic works as Volume VI.

Reducing the Fiscal Deficit Soft and Hard Options

I S Gulati

If the objective seriously is to reduce government dissaving and cut deficit financing then the budget-makers cannot get away by setting their sights only on the fiscal deficit without specifying how the targeted reduction in the fiscal deficit is to be achieved.

THIS short note attempts to set out the issues for debate on the question of reducing the deficit in the government's budgetary operations in the context of the stabilisation programme being currently talked about to meet the difficult economic situation the country is facing.

That the deficit can be quite different, depending on the manner of its measurement, can easily be seen from the accompanying table. Row 3 gives the revenue account deficit for three years, 1989-90, 1990-91 (revised estimates) and 1991-92 (Interim Budget estimates), row 6 the capital account surplus and row 7 the overall budget deficit. In addition, in row 8 is presented for the same three-year period what has recently come to be called the fiscal deficit, a term formally taken note of in the documents of the Interim Union Budget for 1991-92. Finally, in row 9 is presented the figure separately for 1989-90 and 1990-91 of the increase in net RBI credit to the government.

The deficit on revenue account reflects the excess of current government expenditure over current government receipts and can therefore be considered, rightly and properly, to reflect the dissaving of the government sector of the economy. While in 1989-90, dissaving of the government sector, in the above sense, amounted to 2.73 per cent of GDP, the revised estimates for 1990-91 put it at 3.49 per cent.

The government sector incurs sizeable expenditure on capital account and to finance such expenditure the government sector raises funds by borrowing from the other sectors, including the external sector. In addition, the deficit on revenue account has to be met. Are the funds the government sector is able to borrow from the other sectors adequate to meet both the sector's own capital account requirements and the deficit on revenue account? In 1989-90 they were not. The revenue account deficit of Rs 11,912 crore was far, far in excess of the surplus of Rs 1,320 crore on capital account. Hence the

budget deficit of Rs 10,592 crore, amounting to 2.43 per cent of GDP for that year. It is to be noted that only a small part (11.1 per cent) of the revenue account deficit (Rs 1,320 crore out of Rs 11,912 crore) could be met out of the government sector's borrowings after meeting the sector's capital account expenditure commitments; the balance of Rs 10,592 crore had to be met by the sale of treasury bills to the RBI, i.e., through deficit financing. The position in 1990-91, as per the revised estimates, was that as much as 38.7 per cent of the revenue account deficit could be met out of borrowed funds. Although the budget deficit in 1989-90 and 1990-91 (revised estimates) was nearly the same in absolute figures, as a proportion of GDP it was 2.14 per cent in 1990-91 as against 2.43 per cent in 1989-90, indicating that the ratio of deficit financing had declined somewhat in 1990-91.

Analytically, the change in the ratio of deficit financing to GDP should be of significance, particularly when the emphasis of policy has to be on containing inflation. However, it could well be argued that, if a tab has to be kept on the extent of deficit financing, the figure of budget deficit does not reflect fully the extent to which the government sector is financed by deficit financing. The Chakravarty Committee argued strongly in favour of going by the increase in RBI credit to government to measure the resort to deficit financing. That the figure of the increase in RBI credit to government can be significantly different from the figure of the budget deficit can be seen from the table. For both 1989-90 and 1990-91 (RE) the former figure is considerably higher than the latter, though even then the ratio of deficit financing was considerably lower in 1990-91 (2.48 per cent) than in 1989-90 (3.17 per cent).

Interestingly, indeed intriguingly, the maximum attention was focused in the Interim Union Budget not on the revenue account deficit or on the budget deficit or on the increase in RBI credit to govern-

ment, but on what is called the fiscal deficit to measure which one sets off the entire government expenditure, i.e., expenditure on revenue account plus that on capital account, against the government's revenue account receipts. As against the fiscal deficit estimated at 8.59 per cent of GDP in 1990-91, the target the Interim Budget set for 1991-92 was 6.5 per cent of GDP, although the budget figures as presented add up to a somewhat larger deficit of 7.02 per cent. No target is set for either the revenue account deficit or the budget deficit. Actually, however, some reduction is envisaged in both the revenue account deficit, from 3.49 per cent of GDP in 1990-91 to 3.04 per cent in 1991-92 (the absolute figure of revenue account deficit goes up somewhat), and the budget deficit, from 2.14 per cent of GDP in 1990-91 to 1.71 per cent in 1991-92. But the reduction in the fiscal deficit of 1.57 percentage points is sought principally through a significant reduction in capital expenditure. At the same time, there has been a reduction in government borrowing, though not to the full extent of the reduction in capital expenditure. Clearly, however, the axe is to fall in the current year principally on government in-

TABLE: UNION GOVERNMENT'S RECEIPTS, EXPENDITURE AND DEFICITS, 1989-90, 1990-91 AND 1991-92
(Rs crore)

| | 1989-90 (Actuals) | 1990-91 | | 1991-92* |
|--|----------------------|-------------------|-------------------|-------------------------------|
| | | Budget | Revised | |
| 1 Revenue account receipts | 52,296 (12.00) | 57,938 (11.49) | 57,381 (11.38) | 63,584 (10.89) |
| 2 Revenue account expenditure | 64,208 (14.73) | 70,970 (14.07) | 74,966 (14.86) | 81,350 (13.93) |
| 3 Deficit on Revenue account (1-2) | 11,912 (2.73) | 13,032 (2.58) | 17,585 (3.49) | 17,766 (3.04) |
| 4 Capital account receipts ¹ | 25,038 (5.75) | 29,589 (5.87) | 32,559 (6.43) | 30,998 ² (5.31) |
| 5 Capital account expenditure ³ | 23,718 (5.44) | 23,763 (4.71) | 25,746 (5.10) | 23,209 (3.97) |
| 6 Surplus on capital account (4-5) | 1,320 (0.30) | 5,826 (1.15) | 6,813 (1.35) | 7,789 (1.33) |
| 7 Budget Deficit (3+6) | 10,592 (2.43) | 7,206 (1.43) | 10,772 (2.14) | 9,977 (1.71) |
| 8 Fiscal Deficit [1-(2+5)]=(3+5) | 35,630 (8.18) | 36,795 (7.29) | 43,331 (8.59) | 40,975 ⁴ (7.02) |
| 9 Deficit as reflected in the increase in RBI credit to government | 13,813 (3.17) | — | 13,000 (2.58) | — |

Notes: (1) Excludes recoveries of loans and amounts raised by net sale of treasury bills to RBI
(2) Includes Rs 2,500 crore on account of amount to be raised through disinvestment of government equity in selected public sector undertakings in favour of mutual funds and financial institutions.
(3) Net of recoveries of loans
(4) Exceeds the official figure by Rs 2,500 crore on account of amount raised through disinvestment of government equity in public sector undertakings. Reduced by Rs 2,500 crore the fiscal deficit would amount to 6.59 per cent of GDP, i.e., not far above the target of 6.5 per cent set out for 1991-92.
Figures in parenthesis in various rows are respective proportions of GDP at current prices of the relevant years
* Interim budget estimates

vestment to achieve the targeted decline in the fiscal deficit.

One can think of an altogether different scenario under which the revenue account deficit has been the focus of targeting, then not only would there have been any need to reduce the government's capital expenditure, but at the same time the government sector's dissaving would have been drastically slashed, say, from 3.49 per cent of GDP in 1990-91 and 3.04 per cent as envisaged in the Interim Union Budget to 1.92 per cent and even with capital account level of receipts and expenditures remaining unchanged, relative to GDP, the budget deficit would have come down drastically from 2.14 per cent in 1990-91 to 0.47 per cent, i.e., by 78 per cent. As for the fiscal deficit, its reduction to 7.02 per cent of GDP would still have been achieved.

The difference between the two routes of deficit reduction ought to be noted straightaway. Under the route chosen in the Interim Budget, reduction of fiscal deficit is achieved only marginally through a reduction of the deficit in the revenue account; under the alternative route the focus is on revenue account deficit reduction. Under the former route the budget deficit, and hence deficit financing, is only partially reduced. Under the latter, it is drastically curtailed. Of course, by follow-

ing the latter route the level of government capital expenditure and borrowing is maintained, whereas the path taken for the former route envisages sizeable reduc-

tion in both government capital expenditure and borrowing.

It should be evident that by choosing the route the Interim Union Budget did it decided to go for the soft option, an option that would not call for hard decisions that would have to be taken were a commitment to be made for closing the revenue account gap. Nor is any commitment entered into with respect to reduction in the budget deficit or deficit financing, something that one would expect to be high on the agenda if inflation has to be contained. Going by the manner of the Interim Union Budget, the uppermost concern in reducing the fiscal deficit to the extent it does seems to have been to reduce the size of total government expenditure; between 1990-91 and 1991-92, the reduction proposed in expenditure, on revenue and capital accounts together, is from 19.96 per cent of GDP to 17.90 per cent, i.e., by 2.06 percentage points, which is a little over 80 per cent of the scheduled reduction in the fiscal deficit between the two years. If however, the purpose seriously is to reduce government dissaving and/or cut deficit financing then our budget-makers cannot get away by setting their sights only on the fiscal deficit without specifying how the targeted reduction in the fiscal deficit is to be achieved—how much by reducing the revenue account deficit, the budget deficit and/or capital expenditure. The argument here for transparency is not for its own sake but to ensure that the agenda is set in the right terms.

POSITIONS AVAILABLE

Development Support Team, a non-government organisation based in Pune, provides support services in rural development. It requires one LADY FIELD OFFICER for its Belgaum (Karnataka) field office which is being setup to coordinate a support programme for NGOs in Northern Karnataka. This programme is a collective venture of a UN agency and a State Government establishment.

The candidate should have a Master's degree in Social Sciences and about 5 years active experience in the voluntary sector and should be proficient in Kannada and English.

ONE position is that of a field Officer for its Pune office. The candidate should have about 5 years experience and be proficient in English, Marathi and Hindi.

Both jobs entail extensive travel.

Applications including a recent curriculum vitae should be sent to the Secretary, **Development Support Team** 124/11, Erandawane, Pune 411 004 (Tel. 338491) within 15 days from the date of publication.

Smell of Surrender

BM

The finance minister was so satisfied after the devaluation of the rupee that he declared that the foreign exchange crisis had been resolved and he would now turn to the 'constructive tasks' of structural adjustment of the economy. However, having lured the government of India to put all its eggs in the IMF basket, the foreign creditors are playing the proverbial cat and mouse game with this country.

THE Congress(I) government headed by P V Narasimha Rao has embarked on an adventurous course in the management of the economy and the polity. The entire focus is on what is euphemistically called 'structural adjustment' financed by massive foreign credits. In this process the government is fast losing its credibility and its chances of getting a foothold in the prevailing alignment of political forces may disappear sooner than was earlier believed likely.

It is not possible to disagree with the BJP leader, I K Advani that unlike minority governments in the past years, the present government stands completely isolated. Minority governments in the past, among them one headed by Indira Gandhi needed outside support to assure them a majority in parliament and this cast on them the political obligation to seek a measure of consensus on policy issues. The government headed by P V Narasimha Rao lacks such support and has, therefore, to seek a majority in parliament from issue to issue and from day to day. This is not a sustainable position and it can collapse suddenly any time and on any issue. The whole arrangement in which the government rests is by its very nature, unstable.

The government's deal with the BJP on the choice of speaker of the Lok Sabha has called into question its secular credentials. The shipping out of gold reserves to the Bank of England, sought to be carried out clandestinely but soon exposed, is bound to have further damaged the already low credit-rating of the country. Finance minister Manmohan Singh had issued immediately after he assumed office that there was no question of selling or swapping of gold and had promised that he would bring back the gold sold by his predecessor to raise foreign credits. He seems to have become so helpless that he is putting all his trust in the financial and policy backing of the World Bank-IMF combine. But even as he is feverishly negotiating for a big IMF loan under its structural adjustment facility, the fresh credits from abroad which he expected to

flow in after the devaluation and the changes in foreign trade policies as desired by the World Bank-IMF combine are still being held back. This would appear to be intended to expose India's abject helplessness. The idea is that the government in India should be put in such a difficult position that it has no option but to submit to all the conditions, explicit and implicit, laid down by the foreign creditors.

Interestingly even I G Patel, former governor of Reserve Bank of India, who had recently issued a joint statement in support of structural adjustment on the lines dictated by IMF, has been put off by the rather feckless manner in which the complex problems of the economy are being handled. He has said that putting 25 tonnes of reserve gold in the custody of the Bank of England to be available as collateral for raising foreign credits at short notice was a 'national humiliation'. In spite of pledging its reserve gold, the country will be able to manage a loan for only one month of not more than 80-90 per cent of the value of the yellow metal. And this at interest rates much above the LIBOR, I G Patel has disclosed. When questioned in parliament, the finance minister, who talks so much about running an open government, evaded a straight reply on the terms on which the gold had been transferred to the Bank of England. Manmohan Singh's credibility was not enhanced when he retracted his earlier criticism of the gold sale by his predecessor in the finance ministry.

Manmohan Singh was so satisfied after the devaluation of the rupee that he declared that he had put an end to the foreign exchange crisis and he could now turn to the "constructive tasks" of structural adjustment of the economy. But the foreign creditors, it appears, are playing the proverbial cat and mouse game with India. Even after luring India into the IMF parlour, fresh credits are being held back. The government of India had meanwhile been cleverly denuded of the will to stand up and assert its sovereignty before the foreign creditors. All its eggs have been

put in the IMF basket. The government has opted for unreserved surrender before the foreign creditors and to bow towards an economic and, in due course, political regime which suits the interests of the foreign creditors. The notion that the industrially developed countries in the west, as a group and separately, will transfer real resources to spur the stability and development of the Indian economy and polity was always fanciful. These countries, directly and through the international financial institutions controlled by them, may have played some role in augmenting the flow of real resources to the developing countries for a while during the sustained expansionary phase of their economies after the end of the second war. But they ceased to play that role after the mid-seventies when the developed market economy countries themselves were faced with acute problems. This is reflected in the so-called aid weariness, the shrinking of multilateral concessional credits and the stiffening of conditionalities attached to bilateral as well as multilateral credits advanced to the developing countries. The World Bank and IMF in recent years have linked their credits to India explicitly to 'disciplinary measures' euphemistically termed structural adjustments.

It is not fortuitous that during the eighties India played an ambivalent role in the global economic and political arena. It has been adjusting step by step to the demands of the developed countries on the deregulation of its economy, opening it up for market-oriented investment of domestic and foreign capital, and conforming to the laws of the developed countries on intellectual property rights and trade in services.

In addition to the pressure of the developed countries, stepping up their search for profitable markets for their export surpluses and investment, a thin upper crust of Indian society has been striving to bring about shifts in economic and social policies in line with the designs of the developed countries and their multinationals as promoted through the international financial institutions. The facile notion of India emerging as a medium level developing country, notwithstanding mass poverty and a level of industrialisation resting on a narrow social base which has not brought about any change in the occupational pattern of the population, has been cynically encouraged. Things are now coming to a head in India. The so-called policy of liberalisation initiated in the early eighties and implemented with special energy in the second half of the decade has failed to deliver what was promised. While growth has remained uncertain, market forces have tended to boost labour-saving and

capital- and import-intensive technologies and concentration of economic power. Experience has proved that while relaxation of bureaucratic regulation is undoubtedly necessary as well as desirable for unshackling industrial enterprise, meaningful planning and regulation of business activity combined with public investment setting the pace for development are an essential condition for self-sustaining growth.

The joint statement issued by P N Dhar, I G Patel, M Narasimham and R N Malhotra which summarised the World Bank-IMF demands on India and recommended their acceptance was clearly a command performance. Manmohan Singh was obviously so much enamoured by it that he, once again ineptly, arranged its circulation among MPs and was rapped for it. The statement was issued as an ideological onslaught on what are cynically referred to as outdated policies of an era gone by though one of the signatories, I G Patel, had to observe in public that while liberalisation and decontrol were necessary, one should not forget the virtues of self-reliance and austerity which ultimately led a nation to strength and progress.

An alternative line of policy which rejects the IMF line and calls for a

"modulated reform programme" has been presented by a group, including some leading economists. The programme gives priority to mobilisation of domestic resources for growth of the economy and welfare of the people. India is faced with two options. One is the World Bank-IMF line which will shift the burden of development on to the poor, while sacrificing the sovereignty of the country and in the process completely subvert the ability of the system to find an independent alternative. The other is to move towards self-reliance and an egalitarian social order which alone will preserve the economic and political sovereignty of the country. These alternatives have to be squarely faced and must not be allowed to be obfuscated by focusing on selected aspects of the current economic situation, especially the balance of payments crisis. To halt a suicidal policy drift and return to the path of independent economic and social development, adjustments in official economic policy and management have to be made. These adjustments, however, have to be in a direction away from and opposite to the adjustments which the IMF is laying down as the preconditions for its loan and to which the Congress(I) government is submitting as price for the loan.

annum against the dollar, 13 per cent against the pound sterling, 15 per cent against the DM, 16 per cent against the French franc and 6 per cent against the yen. The rate of inflation in India, to which the Reserve Bank press note referred, compared with the rates in the relevant other countries by and large did not exceed these levels. In other words, the exchange value of the rupee has been maintained in real terms in recent years. No doubt it was to this 'realistic' exchange rate policy that the World Bank vice-president was paying kudos.

More importantly, the devaluation of the rupee at a time when both domestic economic growth and world trade are forecast to decelerate is unlikely to produce the expected salutary impact on export performance. Of course, profitability of exporters would improve and the rupee value of foreign exchange reserves would be inflated. On the other hand, import prices, too would go up, instantly contributing to strengthening of domestic inflationary pressures and reinforcing the high cost economy, thereby necessitating further downward adjustments of the rupee's exchange value in the course of the normal working of the exchange rate adjustment mechanism—a vicious circle. The adverse effects of any strengthening of inflationary pressures on the poorer sections of the population do not, of course, need to be emphasised.

Even if the flawed official justification of the devaluation is accepted, the immediate impact will in any case not be favourable because of what is known as the 'J' effect—that prices adjust faster than the volume of trade so as to give an unfavourable turn to the terms of trade. In other words, the trade deficit would continue to grow despite the effective devaluation of the currency until importers switch to alternative domestic supply sources and exporters win back or expand market shares. India may thus have to wait for a year and more to see the expected beneficial effects on balance of payments of the devaluation. By then it may well be a different ball game for the country's polity as much as for its economy.

Wishful Thinking on Devaluation

The devaluation of the rupee at a time when both domestic economic growth and world trade are forecast to decelerate is unlikely to produce the expected salutary impact on exports

LESS than a week after one of the World Bank vice-presidents paid a handsome tribute to India's realistic exchange rate policy in the past few years, the rupee's external value was adjusted downward (to use official jargon) or the rupee was devalued (in common parlance) by about 19 per cent against the US dollar and 17 per cent against the pound sterling in two stages in the first week of July. Fighting shy of admitting the fact of devaluation, both Reserve Bank and finance ministry officials used all kinds of euphemisms. Though it was widely known that there had been no marked movements in the world currency markets so as to warrant a steep downward adjustment in the value of the rupee, official spokesmen brazenly maintained that what had been done was nothing but a routine adjustment.

Adjustments of the exchange rate are, of course, essential to avoid overvaluation of the currency, for overvaluation discourages exports and encourages imports. It also leads holders of foreign currencies to speculate in the parallel market and spurs capital flight. The crucial question here was whether the rupee was over-

valued. Was there any evidence that the rupee's value had risen in relation to those of the major currencies? In a managed floating exchange rate regime, the authorities are supposed to monitor exchange rate movements closely and get ample opportunity to correct the rate if it deviates from the levels considered desirable from the point of maintaining competitiveness, having regard to price movements domestically and internationally. Such downward adjustments of the value of the rupee have been going on ever since the rupee started floating in a managed fashion in 1975 and particularly so in the eighties.

Between 1980 and 1990 the rupee had depreciated through the crawling peg method by 55 per cent against the dollar, 50 per cent against the pound sterling, 60 per cent against the deutsche mark and 72 per cent against the yen. In other words, on an average the value of the rupee had been falling by 5 to 6 per cent per annum in relation to the principal international currencies. Indeed, in the past two or three years, the rupee had declined on an average by 10 per cent per

Manipuri's Thwarted Claim for Recognition

Krishna Chaitanya

The long-standing and legitimate demand for inclusion of Manipuri in the eighth schedule of the constitution is beginning to acquire a militant hue.

MANIPURI is the richest and the most widely spoken of the languages belonging to the Tibetan-Burmese-Kukichin languages family which together with the Munda language family are not represented in the eighth schedule of the constitution, in which only languages belonging to the Aryan language family and the Dravid language family have been included. As many as ten languages from the Aryan and four from the Dravid language families figure in the eighth schedule of the constitution. But the other language families, i.e., the Tibetan-Burmese-Kukichin family and the Munda family spoken by the tribals have not been so included.

Among the Tibetan-Burmese-Kukichin languages spoken by the tribals in the north eastern states, the claim of Manipuri for inclusion in the eighth schedule is the strongest, since it is spoken by the largest number of the people in the region, after Assamese. Thus Manipuri fulfils all the requisites which should qualify it for the constitutional recognition. But the legitimate claim of the Manipuri for being included in the eighth schedule has all along been rejected by the successive government in India. "If a language is to be recognised", India's first prime minister, Jawaharlal Nehru had told the Lok Sabha on August 7, 1958, in what was supposed to be a policy statement on the issue, "it must fulfil two important criteria; the more widespread character of the language and the use of the language by a large number of people".

Manipuri as per the last Census (1981) is spoken by around 13 lakh people, or by about 67 per cent of the population in Manipur, by around 2 lakh people in Assam, by 50,000 in Tripura, by 3,000 in Mizoram and by another thousand in Meghalaya. Besides, a popular dialect of Manipuri, known as 'Meiteilon' is spoken by a section of the population in west Bengal and Uttar Pradesh as well. Manipuri is also the official and 'court language' inside the state of Manipur. Indeed it has been so since time immemorial. During the period of monarchy, it was the language of the king's court. All the royal edicts and other sources upon which Manipur's recorded history has been based, are in Manipuri. The Britishers, after their annexation of Manipur, allowed

Manipuri to be the link language. Throughout Manipur's recorded history it has been the court language known as 'Chairap' and 'Kuchu' in its criminal courts known as 'Garod' and in the special courts for women known as 'Pachas'. At the time of independence in 1947, Manipuri was made the official language of Manipur. In the same year, the Court Act, 1947 made Manipuri the recognised language for the auxiliary courts of the high court.

Manipuri in fact is the one language of the north east with a script that is more than a century old. The origin of the language, as such, dates back to as early as 500 B.C. Owing to its richness, the Bharatiya Sahitya Academy has recognised it as one of the advanced modern languages of the country. The Jawahar Lal Nehru University, Delhi has introduced Manipuri at the post-graduate level by opening a separate Manipuri centre. Other prominent universities like Delhi, Guwahati and North Bengal have also deemed it proper to offer Manipuri as an alternative language paper. Inside Manipur, it has been made the medium of instruction right from the primary to the post-graduate level. On another plane, around four-fifths of the programmes broadcasted from the Imphal are in Manipuri. Other stations like Guwahati, Silchar and Agartala also regularly broadcast programmes in Manipuri. Despite this, the Manipuris' demand for granting their language a place in the eighth schedule of the constitution has been persistently rejected, even though languages which do not fulfil these two criteria, at least not as comprehensively as Manipuri does (such as Sindhi), have been granted the privileged status. The chairman of the Manipuri Language Co-ordination Committee Niromba points out that according to the 1981 Census, Sindhi is spoken by barely nine lakh people whereas Manipuri is spoken by more than 15.5 lakh people.

But then, Sindhi belongs to the Aryan languages family, the speakers of which together with those of the Dravid language group live in what passes, as the 'mainland of India and constitutes the so-called 'mainstream' of Indian society and polity, whereas the users of Manipuri live in the north eastern states which our ruling elites treat as no better than their imperialistic

strongholds. How can the language of a colony be given a place in the constitution of the master country? There cannot be any other explanation for the denial of constitutional recognition to Manipuri.

It is this attitude of our ruling elites, of which the denial of constitutional recognition to Manipuri is a typical example, that is responsible for the continued alienation of the north eastern tribal societies from the national mainstream. The rejection of the legitimate aspiration of Manipuris has naturally generated a feeling of hurt, bitterness and alienation. Such feelings are understandable if we consider the inferior treatment to which the language is being subjected. Manipuri children grow up receiving education in Manipuri but when they begin job hunting they find that they are not allowed to take up examinations for civil and other services of the government of India in their own language. Thus they find that the already limited number of government jobs available are further limited in their case. Similarly, even though recognised by the Bharatiya Sahitya Academy as an advanced modern Indian language, works of art and literature in Manipuri are subjected to inferior treatment. For instance, Manipuri dramas are denied entry in the annual drama competition organised by the AIR. Nor are Manipuri films accepted for the film festivals except in a special category. Again, though Manipuri legislators speak only in Manipuri, in the state legislature,

MPs from Manipur are not allowed to do so in the parliament

Such humiliations naturally create resentment and if not remedied is bound to lead to rebellion. Until 1989 it was solely the Manipuri Language Demand Committee, an organisation of intellectuals and literary figure, which had been articulating the aspirations of the Manipuris on the language issue. Their method of such articulation was confined to rallies and seminars both at Imphal and Delhi and to sending memorandums to the government. However, at the time of the 1980 general election the All Manipur Students Union (AMSU) decided that they had enough of memorandums and assurances. AMSU not only took the lead in the formation of Manipur Language Demand Co-ordination Committee (MLDC) but also succeeded in persuading organisations like Tripura Upjatiya Yuva Samiti (TUIAS), All Assam Manipur Students Union and Manipuri Apunda which is the coordinating body of Manipuris living in various north eastern state other than Manipur to extend their unequivocal support to the cause of Manipuri language. AMSU also asked the political parties in Manipur and their candidates to spell out their stand on the language issue in clear cut terms. Parties other than Congress(I), like Manipuri People Party and the Janata Dal promised that they would exert pressure on the central government to include Manipuri in the eighth schedule. According to Niromba, some of the candidates even promised that if they failed to solve the language issue they would resign their seats.

After the formation of the National Front government at the centre, the newly formed language committee again sent a memorandum to the government. It took three months for the government to acknowledge it. But what the committee received was a terse reply that extending the eighth schedule would create many problems and so the government's language policy would remain unchanged. Enraged by this betrayal, the committee announced the resumption of its struggle and again the AMSU took the lead by announcing its decision to boycott the schools and colleges. From January 1990 AMSU organised a spate of bandhs and demonstrations on this issue. The response of the present Manipuri government which came to power on an election manifesto that promised inclusion of the language in the eighth schedule of the constitution was like that of any other government—ordering the paramilitary forces to suppress it. Thus during the last one year at least five agitationists have been killed and several others injured in the police firing. In January last, AMSU also gave a call for boycott of republic day function which was a success.

What distinguishes this new phase of

the agitation is its renewed vigour and a clear militancy with the youth and students coming into the forefront of the struggle. Previously it had been the Manipur Sahitya Parishad firstly and the Manipuri Language Demand Committee later on, which had been spearheading the struggle by organising demonstration in Imphal, celebrating Manipuri day in Delhi, organising seminars in Imphal and Delhi and submitting memorandums to the government. Such actions had elicited only hollow promises.

In May last, panicked by the militancy of the movement the then chief minister Ranbir Singh rushed to New Delhi with an all party delegation minus Congress(I), which has been opposing the move for Manipuri's inclusion in the eighth schedule. The delegation met the then prime minister V P Singh who is reported to have assured the delegation that he favours the inclusion of not only Manipuri but some more languages in the eighth schedule. V P Singh is also reported to have asked the delegation to mobilise the support of the opposition parties, particularly that of the Congress(I) so that

bill on the issue as and when introduced does not fall through in the parliament.

The MLDC however, boycotted the all party delegation and instead sent a separate memorandum putting forward the legitimate claim of Manipuri and requesting the PM to expedite the process of granting constitutional recognition to Manipuri. However, these eight or nine months since then have seen no action emanating from the government side on the issue.

The inclusion of Manipuri in the eighth schedule is urgently called for to correct the grave injustice meted out to Manipuris. Any procrastination on the issue will only support the insurgents' argument that—there is no salvation for the north eastern tribals under the Indian constitution, that Indian imperialists will not allow the tribals their legitimate rights, that there is no difference between various political parties and so irrespective of whichever party comes to power the north east will continue to be treated like a colony and the Indian polity holds out no hope for the fulfilment of genuine regional democratic aspirations.

NATIONAL CRIME RECORDS BUREAU

(MINISTRY OF HOME AFFAIRS)

EAST BLOCK-VII R.K. PURAM

NEW DELHI-110066

SCHEME OF CASH AWARDS FOR BEST PAPERS ON FINGER PRINT SCIENCE

Original papers are invited from the personnel working in Police Departments at the Centre, States and U.Ts and all others working outside the Police Departments, viz., IITs, Universities, Government of India Undertakings and other private autonomous scientific and technical institutions, on research and development of finger-print science (Dermatoglyphics) related techniques and technologies of identification. The theme of the award for the year 1991-92 will be "Detection/Identification Of Scene Of Crime Fingerprints- New Methodologies". The papers may be addressed to the Director General, National Crime Records Bureau, East Block-7, R.K. Puram, New Delhi-110066 so as to reach him by 30th November, 1991.

Papers submitted earlier for this award will not be considered. Only one paper by one author submitted individually or jointly with co-author(s) will be considered for the award. The papers are to be submitted in triplicate, clearly marking the envelope "Paper on Finger-Print Science For The Year 1991-92". The name(s) of author(s) should not be mentioned anywhere on the paper. A separate forwarding letter should be used for sending the paper and should contain the names and addresses of the author(s) along with the certificate that the paper was not submitted earlier for the NCRB awards.

The paper should be based on the in-depth study or research carried out by the author(s). There are two sets of **Cash Awards of Rs. 5000/-, Rs. 3000/- and Rs. 2000/- each** for Police and Non-Police streams. The decision for the Awards will be finalised by **March, 1992**.

Perception and Presentation

A Telugu Film on Naxalites

K Balagopal

The changes that have occurred in the establishment's picture of Naxalism have run a tortuous course. Each time in the recent past when it thought that a proper way of presenting the Naxalites to the people had been devised it discovered that the reality had moved ahead and the framework had to be re-done. An instance of the latest recasting of the framework is the recently made film People's Encounter.

I

WHAT the ruling class thinks of a rebellion, what it wants the rebellious classes and the intermediary classes to think it thinks, and what it wants those people themselves to think, are three different though closely interrelated things. Of these, only the last two are visible. They are expressed in the press, in cinemas, in literature, in politicians' platitudes and polemics, in academic theories, etc., intermixed from below with some amount or other of the opinions of the intermediary classes and affected to one extent or other by the internal contradictions within the *establishment*. The first of the three—what the ruling class itself thinks of the rebellion—can only be inferred from the last two. Simultaneously one infers also the current state of the relation between the ruling class and the rebellion, that is to say the current state of the class struggle, for it is this that ultimately decides what the ruling class thinks and what it says, and the gap between the two. This is the true 'meaning' of the theories, the polemics, the ideas and the myths propagated through the cinemas, the press, literature, and other 'forms of social consciousness'.

The analysis of thought structures, of frameworks of cognition, is in fashion these days. The project is inherently epistemological but usually it is the epistemology that is most ambiguous. A socially significant framework of cognition can be made sense of only as the product of a particular tension in the historically evolving totality of social relations, these relations are *real* and *external* to the framework, and they determine the various frameworks employed to cognise them. Underlying any act of cognition is the social-historical process that is simultaneously a product of human practice and—at any given cross section of time and place—the determinant firstly of objective limitations to the possibilities of human practice and secondly of a

range of frameworks of cognition, a range of structures of social consciousness. It is not that any framework can be chosen by anybody, on the contrary the position that a group or class occupies in the objective historical process and the choice it makes from among the possibilities of practice open to it in the current state of the social struggle play a determining role in this choice. And it is not that any choice is equally valid in the sense of being true to reality or equally honest in the sense of being genuinely believed by its proponents. The fidelity of any ideology to objective truth—its capacity to cognise reality faithfully—and to subjective truth—its concurrence with what the class or group that propounds it really believes to be true—varies, and it can be by and large said that the more a social class or group is on the ascendant, the more that it is able to carry others with it and is courageous in the choice of the possibilities open to it, the more efficacious will be the framework of cognition it 'chooses' and the more honest will be its presentation of its perceptions. Analysis of thought-structures, therefore, cannot end with a clarification of its internal relations nor with a merely formal linking with a mutilated reality that is neither seen as part of a totality nor as part of history nor—most importantly—as a determinant of the cognitive structure but only as an epistemologically unrelated symbolic parallel. The analysis must *infer* the cognitive structure from the reality that is epistemologically prior to it, though it is perceived and analysed through one cognitive structure or other.

Many objections will be raised to this project. It will be said that such a process of reduction will stumble upon too many irreducibles but while the difficulty of executing the project in full must be admitted, two things need to be added: one, the very lack of a holistic-historical outlook encourages analysts to discover more irreducibles than are actually there, two, as Lenin said, scientific materialism

unabashedly admits that naive realism is its first cousin. Whatever the analytical difficulties of reducing an ideology to its material base, unless one posits the existence of such an epistemological relation, one will be left with a politically debilitating agnosticism. The nonchalantly truth-neutral, value-neutral way in which the word 'discourse' is being bandied about these days makes it necessary to emphasise this. It will further be asked: when reality is never perceived directly but only through one framework of thought or other, and when all possible frameworks are generated by that reality itself, how does one get hold of a framework that explains every other framework, a framework that will judge the truth, the honesty and the efficacy of every other framework. It is precisely here that the replacement of epistemologically sound notions like practice, ideology, class interest, progress, etc., with the dubious notions brought into being by the latest explorations in *Mimamsa Shashtra*—or perhaps one should call it *meta-Mimamsa Shashtra*—should be thoroughly criticised. All frameworks of consciousness are not equally valid, equally honest or equally fruitful. The capacity of a given cognitive structure to reveal the truth depends on which social practice has generated it. The most advanced social practice, that of the historically most dynamic social class or group taking maximum advantage of the possibilities open to it, generates the framework of thought most faithful to contemporary reality, and the framework of expression most faithful to itself. Such a framework can 'see' the reality underlying other cognitive accounts. If it is finally objected that there is no analytical test for determining which is the most advanced social class or group nor which is the best possible choice of the opportunities open to it, and that therefore the philosophical project ceases to be purely analytical and becomes political, then the answer is that that is as it should be. Indeed, unless the philosophical project ceases to be purely analytical and actually becomes political, we cannot rid ourselves of this crippling agnosticism that crops up again and again in ever new and seemingly radical and intellectually very fashionable forms. Intellectual history, unfortunately, appears to be moving in the opposite direction. From being theorists of a reality that they made no attempt to change, the most fashionable thinkers are turning into theorists of a meaning that knows no criterion of truth and falsity. The meta-theoretic project makes sense only as a critique of theories born of reactionary, conservative or hesitant social practices from the stand-point of the theoretical position of the most advanced social prac-

tice. Otherwise the notion of thought climbing over itself and turning into an abstraction that looks down upon its own concreteness is merely the latest conceit invented by the alienated human intellect.

II

The 'Naxalite menace' has started menacing the framework of understanding popularised by the *establishment* in Andhra Pradesh. Indeed it is this menace rather than the actual 'menace' that is resulting in frustrated outpourings in the press and elsewhere. Each time in the recent past when they thought they had evolved a proper way of conceptualising and presenting the Naxalites to the people, they have discovered that reality has moved ahead, and they have to re-do their framework. The more the people at large start looking to the Naxalite movement as a possible political alternative the more difficult becomes the task of devising a credible but negative presentation of the 'Naxalite problem'.

The changes that have come about in the *establishment's* picture of Naxalism have run quite a tortuous course. It should not be thought that the picture has been purposefully created by some Board of Ideological Managers; nor is it true that at each turning point in the political struggle between the revolutionaries and the *establishment*, a whole paradigm has been discarded and a new one constructed. No such thing has happened. But individual themes have been devised, elaborated and discarded, and at any given point of time what prevails is a not very coherent total picture. What has destroyed the coherence is not the general truth that ideology is rarely consciously crafted, a fact which has never obstructed coherence, but a two-fold change that has gradually crept over the state's politics. One is the degeneration of ruling class politics to a level that is all set to vie with the popular image of Bihar, a fact that destroys the propaganda value of the image of violence commonly used to describe Naxalism; and the second is the recent success of revolutionary politics in catching the imagination of the broad masses as a political alternative, as distinct from a successful strategy of social and economic militancy. There was a time, not long ago, when revolutionary politics appealed only to its immediate social and economic beneficiaries and visionary idealists. It is only recently that in the search for an alternative to the absolutely disgusting level to which ruling class politics is degenerating rapidly, Naxalite politics has started catching the imagination of a large section of the public. The revolutionary groups themselves do not appear to have fully appreciated the significance of this change,

which would require considerable reorientation of their organisational methods, but that is not of much moment right now. The change and the particular tension it generates in the relation between the ruling classes and the people at large—both in their manifestation as toiling and oppressed masses and as political animals—as well as the tensions it generates within various sections of the propertied classes, puts a heavy pressure on the conscious and unconscious creators of ideology, and on the possibility of viable and coherent cognitive frameworks.

There is a recent vantage point from which one can study the outcome of these tensions and pressures. That is a film recently made by Ramoji Rao entitled *People's Encounter*. Ramoji Rao is the most class conscious representative of the dominant section of the provincial elite of Andhra Pradesh, and also a man who has always been conscious of the importance of political and ideological tasks. To give him due credit, he is not guilty of the usual incompetence and inefficiency in the execution of the task he sets himself, a trait that sets him apart in a class that characteristically vulgarises and bungles any task that requires the slightest finesse. What Ramoji Rao and his class really think of the Naxalites and what he wishes to suggest that the people should think of them, are closely interwoven in the themes and images that constitute the film. It is the latter that is explicit and visible, for when a class-conscious elite produces a piece of art or literature what it is telling you is primarily not what it thinks, but rather what it would like *you* to think, unlike an oppressed class or group, whose art is primarily a statement of its own ideas. To put it differently, the art of an oppressed class is never honest whereas the art of the oppressed is always honest even when it is untrue.

In creating a critical image, there are two possible choices. One is to pick up the deviance and errors of the original and create a summary and pass it off as the image of the original; the second is to ignore the deviance and stick to essentials but give it an interpretation that recommends its rejection. The image of Naxalism created by the Telugu press in which Ramoji Rao's *Eenadu* has generally played a leading role has primarily been of the first type. The acts of arbitrary violence and extortion are totalled up and labelled revolution. But in making this film, which is a more explicitly ideological venture—and also, incidentally, a more directly commercial venture—Ramoji Rao rejects that method and creates an image of the second type. This is one reason why the police was reportedly unhappy with the film, for they would have liked an ex-

posure of the bad side of revolutionary politics rather than the creation of a more complex image which, in their view, gives needless legitimacy to the Naxalites. They cannot, of course, understand that the legitimacy has already arrived, and the film is only being intelligent enough in realising that it has.

The dialogue between violence and non-violence is a central theme of the film. There was a time when this opposition formed the staple of the ruling classes' presentation of the 'Naxalite question'. The dialogue, naturally, used to end in a vindication of non-violence as the path best suited to our culture, to the tenets of humanism, and the only legitimate political choice in a parliamentary democracy. There was undoubtedly a time when this presentation had an element of honesty (which we have earlier distinguished from truth) in the sense that India's ruling classes did believe that they could sort out their internal political problems and deal with the dissatisfaction of the masses through the institutions of democracy without recourse to abnormal quantities of explicit violence. Today its use cannot boast of even that much of honesty.

And yet the dialogue between violence and non-violence continues to haunt the ideologues of the propertied classes. It is principally a measure of the intellectual bankruptcy that the degeneration of their material existence has driven them to, but Ramoji Rao adds two supplementary arguments centred around the problem of violence to salvage something from the demise of non-violence as an ideological weapon. The protagonist of non-violence in the film—and of everything else the director wishes to tell—is a woman doctor by name Jyoti. She is a very human creature in contrast to both the Naxalites and the police. She is charming, has a sense of humour, and expresses many homely sentiments. It is easy for the viewers to take a liking to her and identify with her. And she is a determined and principled votary of non-violence. She gives up her policeman husband because she cannot accept the taking of human life in the name of 'performance of duty' and she disagrees with her Naxalite brother because she cannot accept the taking of human life in the name of a better future. She represents all the non-violence centred arguments the film-maker uses against Naxalites: the traditional one that it is morally wrong, and the supplementary ones added (though by no means invented) by the film-maker, that violence is unnecessary for achieving justice and that it brings needless repression onto the masses. The first argument was greeted with derision and mirth by viewers in

cinema halls across the State. Jyoti the wide-eyed doctor gives lectures to the Naxalites about democracy and violence and challenges the Naxalites to give up their path of violence and aspire for power by mobilising mass support and participating in elections. Given the stark reality that elections are not won by mobilising mass support but by mobilising liquor, money and muscle power which is as violent a method as the proverbial 'barrel of the gun', this argument does not carry much conviction with the viewers. The maker of the film is no more convinced—less indeed, for he cannot possibly have any of the doubts that the gullible among the masses may have—but he would like to convince them if at all that is possible. There being not much possibility of that, Ramoji Rao adds to the moral argument the more 'pragmatic' argument embodied in the second: people's problems can be solved by legal and democratic means if only one has the patience to pursue the effort; such patience, indeed, is the price one pays for democracy; and it is only the impatient who take to violence as a quick and easy solution. A situation is introduced to try out this argument. A landlord living in a tribal area, finding that the tribals are resisting his attempts to grab their land, manages to get an eviction order from the government on the ground that the tribals' land is to become part of a tiger sanctuary. When the tribals resist the eviction order and stage a dharna peacefully under the leadership of the good-hearted doctor the police intervene and beat them up mercilessly. The Naxalites then enter the picture, charge at the policemen with dreadful looking automatic weapons, and drive them away. The doctor remonstrates against this violent intervention which would only bring repression upon the tribals. She issues a challenge that she would get the eviction order stayed by legal means and the Naxalites laugh at her. (So, indeed, do the viewers in the hall). She first encounters the hurdle of corrupt ministers and pliant officials. A genuine dilemma is thus introduced which, if unravelled realistically, could have made for a meaningful discussion of at least one important aspect of 'the Naxalite problem'. But the dilemma is resolved most dishonestly. The state's high court, allowing a petition against the eviction filed by the doctor, pronounces that since there is no evidence of the presence of tigers in the area the eviction should be stopped; and it even discharges at one stroke the tribals from the criminal case of trespass and resistance of authority filed against them. This is a dishonestly anti-climactic denouement, for if it had been so easy to move our courts and obtain justice for the poor and the oppressed the question of

political violence would never have arisen except as an abstract debate. Communist revolutionaries may believe that the working masses cannot obtain political power by peaceful means, but the working masses themselves, taken as a whole, are attracted initially to revolutionary violence not for this reason but for the reason that it offers a feasible way of obtaining justice in a society in which none of the legitimate institutions of authority are effective in doing so. Ramoji Rao is close enough to the administration to know that there are literally hundreds of cases of tribals petitioning either the courts or the government about eviction from their land in the name of forest conservancy if not animal sanctuaries; and that very few of these petitions have been settled in favour of the tribals; and further that it is only where the Naxalites have intervened and either organised a tribal protest or threatened the officials that the evictions have stopped, the total quantity of forest land thus being in the 'illegal' enjoyment of the tribals tallying upwards of four hundred thousand acres in the State. And he is also knowledgeable enough about the ways of the world to know that the common experience of persons who are organising the poor and the oppressed through legal and peaceful means is one of tremendous frustration. It is an insult to the intelligence of the people to suggest that they are resorting to violence when a writ petition in the high court would work equally well.

In any case the argument convinces no one. So the film employs as its central theme the third argument centred around the question of violence. This argument is basically no more honest, but that does not matter from the point of view of efficacy since it is not yet totally discredited. It is clever enough to use non-violence, not as an argument on behalf of the system and against the revolutionaries, but on behalf of the people, and *against* the establishment as well as the revolutionaries: 'your violence and their violence is crushing us on both sides'. This argument of 'the common people caught between Naxalite violence and police violence' is a happy solution to the dilemma the Telugu press faced some time ago, of how to stop ignoring the very evident occurrence of 'police excesses' and yet not lend credibility to the politics of Naxalites. It was popularised by Ramoji Rao's own *Enadu* and picked up gleefully by the rest of the Telugu press. It is this 'encounter' of the people with the corrupt, brutal and immoral establishment on one side and the impatient and cold blooded Naxalites on the other side that gives the film its title. It is only in this form that the argument of non-violence retains any presentability at all.

But why do Naxalites use violence, and why do the police crush the people violently? This question has to be answered by the *establishment's* presentation of the 'Naxalite problem'. The revolutionaries themselves explain their violence as a necessary means for the overthrow of the armed might of the state of the propertied classes and the establishment of the political rule of the working masses. This, naturally, is never discussed in the *establishment's* presentation, though a person like Ramoji Rao who was once upon a time a fellow-traveller cannot claim to be unfamiliar with it. The police view of revolutionary violence consists of two elements: that it is a species of gangsterism with which some people acquire wealth and power; and that it is a desperate way to political power that parties which are unable to win elections have opted for. These arguments, however much the maker of the film may find them appealing, are not acceptable to the people and therefore they cannot become part of a credible presentation. The argument for revolutionary violence that is most commonly given and widely accepted by the masses is that it is the only feasible way of obtaining justice in a society wherein every institution of democracy has been prostituted to the purposes of the rich and the powerful. This explanation is widely prevalent, and has even been publicised well by the press whose small town reporters have all got converted to this view much to the annoyance of their editors and proprietors. This view of Naxalite violence frequently results in the bemusement of its converts for a considerable part of Naxalite violence is oriented towards their larger aims and is in no way related to the solution of any immediate problem, but nevertheless it has held its ground and is gaining rapid acceptance. Ramoji Rao takes over this version for his film, but incorporates it as part of the basic theme where the 'people' are pitted against the corrupt and brutal *establishment* as well as the cold-blooded revolutionaries: selfish politicians and corrupt administrators have subverted our democracy, and the Naxalites, a mixture of impatient idealism and cold-blooded calculation, are taking advantage of the resultant crisis to offer quick and ruthless solutions to problems for which the system offers no solution, but in the process they are completing the destruction of the system and paving their way to power with the blood of innocent people. Police violence, in this presentation, becomes a necessary counter to this strategy, for no system can silently allow subversives to take advantage of whatever is rotten within. But the hatred that the people have for the brutalities of the police is such that Ramoji Rao cannot af-

ford to ignore it if his effort is to have credibility, and so the actual depiction of the police is in a terribly uncomplimentary light. Indeed the film shows the police in such a bad light—as a bunch of corrupt, self-serving, bunglers—that the police establishment of the state was reportedly very unhappy with the censors for having allowed the film. However, the common feeling that people have towards the police is such that it is impossible to make a film on political violence that will be credible enough for the people to see it, and will also please the police. In any case this kind of a presentation of what is 'rotten' in the police does not in any way militate against the role attributed to it in the total political context.

Even within an empirical understanding of the question of political violence as an efficacious way of solving people's problems in a system in which all normal means of justice have been subverted and destroyed, there is third element to the debate that even the most honest presentation of the ruling class will not discuss. It is not merely a question of revolutionary violence vs police violence. To admit the first term into the discussion would be fatal to the kind of presentation that Ramoji Rao makes. And so it is not admitted but instead is subsumed under the confession that the people do have a lot of problems whose solution is being rendered impossible by corrupt and inefficient administrators and degenerate politicians, leading to the search for violent means of solution. That violence—poverty, hunger, destitution, inequality, domination, oppression, unfreedom—is inherent in social structure is not admitted, for that would alter the whole context of the discussion of revolutionary violence. All that is admitted is that while the system may not exactly be a garden of Eden it is basically livable and workable except that unfortunately there has been a growth of corruption, brutality and other undesirable traits lately which needs urgent remedy. Some apples, in other words, have started rotting. In this film, the system is represented by a brutal, oppressive and lecherous landlord living in a tribal area and the forest and police officials who are subservient to him. The landlord has forced a woman to live with him and offer her body to the government servants who are his henchmen. (She finally denounces him in a people's court and gets him shot dead by the Naxalites.) The film makes no effort to hide the ugliness of these rotten apples, a determination that covers a bigger resolve to never admit that what is rotten is more than a few—or many, for that matter—individuals. This deceptively confessional attitude is now quite typical of the public face the ruling class puts on. It is so con-

scious of the need to admit just this much and nothing more that the moment you try to bring in the argument that the structure itself is unjust and iniquitous it bursts out with angry rhetoric about Poland, Roumania and Tiananmen Square.

Naturally, when only this much of rottenness is admitted and the possibility of curing it by means sanctioned by this very structure is asserted, then revolutionary violence starts hanging in the air, bereft of a material basis and a historical justification. *It becomes an autonomous act of political choice made by self-willed individuals, a choice that need not have been made at all, had those individuals not willed it capriciously.* Once the revolution is thus made an act of autonomous choice that need not at all have been made, the suppression of revolutionaries and the people behind them by the state becomes an act of legitimate counter-violence in self defence. And if the people are harmed in the process, that is extremely reprehensible, but it is very evident who caused the whole thing. It is the determination to save this argument about 'who started it' that leads to such passionate outbursts about what happened in eastern Europe whenever you try to talk about the violence inherent in the structure of our society, a violence that is reproduced and not cured by its institutions.

The moment revolution is turned into a capricious act, autonomous of historical necessity, it becomes whimsical and arbitrary, romantic and brutal. The romantic and the brutal are the most compelling qualities of the images of revolution this film presents. The large majority of actual 'Naxalites' are quite mundane individuals living underground or above, organising people in villages, mines, colleges, factories and 'bastis', but this film knows nothing of their existence. The 'Naxalites', for this film, are tough young men and women who dwell in permanent isolation on the invisible slopes of the other side of the hill. When the tribals need them they become mysteriously aware of it and come dancing over the hill to the accompaniment of heralding music, dressed in olive green and carrying very terrible looking automatic firearms. They start firing from their weapons without even stopping to take aim, and depart back to the other side of the hill the moment they have killed enough. Now and then they make a short and contemptuous speech in reply to the doctor's voluble hectoring. They are coldly self-assured and confident in contrast with the very warm and human doctor and the bungling policemen who corruption has reduced to a subhuman level. There is a telling scene in the film—a Naxalite is killed by the police in a fake encounter. A bright

policeman, the doctor's former husband in fact, gets the idea that instead of cremating or burying the dead body they should let it lie there and keep watch over it so that when the dead man's comrades come looking for the body they can also be apprehended. The other policemen accept the suggestion, and they put the corpse up on a tree and stand guard underneath and around the tree. The dead man's comrades, instead of giving up the idea of taking the dead body, as any real life revolutionaries would do, decide to lift the dead body literally over the heads of the policemen and take it away. They build a rope bridge from tree top to tree top, descend on the body from above, tie a rope to it, and take it away dangling at the end of the rope. The point is not whether Ramoji Rao himself is unintelligent enough to believe this to be possible. The point is what makes such a feat part of the image of a Naxalite projected in this presentation of Naxalism by a very class-conscious member of the ruling class. The point is what is the total picture that these images of cold-blooded efficiency, silent brutality and inhuman confidence add up to.

The whimsicality and the arbitrariness of the revolution lies in each act of the process becoming autonomous of the others, rendering the totality of it senseless. This is the way the press in the state has always depicted Naxalite politics, as a series of unconnected, unintelligible, autonomous acts of romantic and brutal cruelty, and this is the impression about Naxalite politics that anyone learning of it through the press is bound to get. When Ramoji Rao was accused of distortion of reality in making this film, he replied very truthfully that anybody who has been reading the papers for the last two years knows that what he has said in the film is nothing but the truth. That is so. The press itself—with a leading role played by the daily of which Ramoji Rao is not only the proprietor but also an almost mythically watchful editor—has invented the presentation of Naxalism as a series of unconnected and autonomous acts, a presentation taken over by the film. At places the fracture becomes so acute that the film merely produces shot after shot of newspaper photographs of burning of buses, blowing up of police jeeps, kidnapping of government officials, killing of police informers and the dynamiting of buildings. It creates a very effective picture of mindless violence that rounds off the argument of autonomy. Naturally then the police must step in. Some—indeed many—of them may be stupid, avaricious, lecherous, brutal, but the task of policing is an essential task. Our society—it suddenly becomes 'our' society to the unguarded viewer—cannot be allowed to

be blown up by this mindless violence. It is here that one suddenly realises that the film's seemingly candid depiction of the police is very deceptive. The image of the police that all of Ramoji Rao's candid depiction adds up to is not one of a brutal instrument of suppression but of an undependable and inefficient guardian of our society. Just as the image of the politician that his equally candid depiction adds up to is not one of a defender and a representative of an oppressive society, but of a weak, incapable, corrupt, venal humbug whom we cannot trust with the task of ruling this country.

To achieve this certain things are quite consciously left out of this film that purports to discuss the 'Naxalite problem' frankly. The most striking omission is the very methodical brutality with which the state has met the revolutionary challenge. The Indravelli tribal massacre was a conscious attack on a peaceful gathering aimed at stemming the rapid spread of revolutionary organisation among the very militant Gondhs who are the biggest tribe of south central India. In this film it becomes a routine police firing on a mob following a fatal attack on a policeman by a tribal girl who has been raped by him. The police department for all that it has its share of corrupt, bungling, cowardly officers, is by no means the ludicrous force the film makes it out to be. Both its regular force and its special wings—the nameless numberless gangsters armed with anonymity and unbridled powers to kill and maim—are very efficient in their ruthlessness, and its intelligence wing possesses quite a lot of intelligence. That the police has not been able nevertheless to solve the 'Naxalite problem' is besides the point. No police force anywhere in the world has solved any such problem of political rebellion. It can only suppress more or less brutally, more or less intelligently and more or less temporarily and the Andhra police has been no less efficacious than any police force anywhere. And the same is true of the political leaders whose failure to solve the problem is no proof of their lack of determination and intent, but only of the impossibility of the task.

But to admit this would be to admit that the state is inherently a repressive apparatus, and to bring the discussion perilously close to the forbidden threshold of the notion of a violent and oppressive social structure guarded by a violent state apparatus. It would then remove the image of fractured acts of brutality attributed to the incidents of incendiary protest indulged in by the People's War group. It would reveal that for a period of nearly two decades a regime of unquestioned police brutality prevailed, about which the press rarely wrote, 'public opi-

mon' scarcely bothered, the courts and their *habeas corpus* jurisdiction were impotent, and the political government was unfazed notwithstanding sizeable democratic protest. It would reveal that Ramoji Rao and his ilk would never have felt it necessary to break the long silence and talk to the people about the 'Naxalite problem' through their papers and their films if the Naxalites had not discovered at least a temporary if rather doubtful way of unsettling through acts of arson, detonation and abduction the complacent establishment which had thought that a few more guns to commit a few more encounters and a few more ingenious methods of torture would see the end of the 'problem'. And it would then go on the focus attention on certain very basic facts which Ramoji Rao's films and the establishment's polemics in general steadfastly refuse to acknowledge. I am not referring to abstract things like the historical necessity of revolutions but to much more concrete things that if today over large parts of the state, the poor and the wretched are walking with head held high, that is because of the Naxalites, that in spite of the most brutal suppression the 'Naxalite problem' has spread from the remote corner of Srikakulam to each of the 23 districts of the state, not excluding Hyderabad city where the landgrabbers and political warlords no longer feel very safe, that there would have been no integrated Tribal Development Agencies, no Tribal Co-operative Corporations, no Remote Area Development Programmes, none of the tremendous exposure that has become customary of the corruption of government servants and the inefficacy of courts, nor the repeated talk of implementing land reforms that has become fashionable once again, but for the Naxalites that it is the 'Naxalite menace' that has generated a whole new culture of people protesting against and agitating about every act and incident of injustice, people collaring errant government officials and elected representatives and those lordly creatures coming to regard themselves answerable to the masses.

A presentation that refuses to acknowledge so much of the problem can not resolve it with any credence. Jyoti the doctor sits in a hunger protest on behalf of the 'people' demanding that both the parties—the Naxalites and the government—give an assurance that they will abjure their respective paths of violent protest and violent suppression. Since the demand does not address the real problem of either party, she cannot possibly succeed. The 'people' in the film are shown to side with her but the people in the cinema hall are evidently very impatient with this artificial presentation of the problem of political violence. To give him due

credit Ramoji Rao does not attempt an artificial denouement to match it. Neither side accepts the hand of non-violence held out by the doctor, but in an evidently symbolic last scene, the toddler born to the tribal girl raped by a policeman comes forward and holds the dying doctor's hand. Since the burden of proof or disproof is thus pushed on to the future, any reaction to it can be dismissed as prejudice, and therefore it is best to leave it unstated.

Job Reservations and Efficiency

A M Shah

Efficiency or merit is not a fetish of the elite, but an essential ingredient in every field of life, whether in the defence services or department of space or in the soft fields like language and culture. The policy of reservations for backward classes is a major barrier to achieving efficiency.

IT has become difficult to discuss the question of efficiency and merit *vis-a-vis* reservations for backward classes dispassionately these days. Even well-meaning social scientists become passionate in discussions of this question and accuse others of prejudice arising out of their caste and class background. In effect they repeat the debate on relative influence of heredity versus environment on intelligence which was settled in favour of environment long ago. No social scientist worth the name would now argue that children of the blacks or of lower castes and classes are born with low intelligence. This does not, however, mean that prejudices do not exist at the popular level. It should be possible, however, to rise above these prejudices and have a dispassionate discussion of the efficiency question.

The constitutional concern for efficiency is clear in article 335, which reads: "The claims of the members of the scheduled castes (SCs) and the scheduled tribes (STs) shall be taken into consideration, consistently with the maintenance of efficiency of administration, in the making of appointments to services and posts in connection with the affairs of the union or of a state" (emphasis added). While inefficiency can result due to many factors, article 335 indicates that a policy of reservations of government posts inconsistent with requirements of efficiency would become a deliberate pursuit of efficiency.

Why does the constitution refer to efficiency with regard to only SCs and STs and is silent with regard to other backward classes (OBCs) is puzzling. In any case, however, if considerations of efficiency apply to reservations for SCs and STs, they should apply with greater force to reservations for OBCs, who enjoy higher social and economic status and whose constitutional entitlement to reservations is lower than that of SCs and STs.

It is essential to view the term 'administration' in article 335 broadly and in the context of modern economy and society. A major change has taken place in the nature of personnel employed by the government during the last 40 years or so. Today, administration is not confined to the central and state secretariates and the offices of commissioner, collec-

tor, magistrate, tehsildar, and so on. The government establishments now cover a vast range of specialised fields, such as space, atomic energy, aeronautics, meteorology, electronics, scientific and industrial research, hospitals, and so on. The public sector undertakings include huge modern factories, banks, and business corporations. Municipal and zilla parishad administration also includes technical posts such as those of architects, engineers and doctors. The so-called general administration includes many posts requiring technical skills in economics, statistics, accounting, law, etc. With computerisation the nature of skills required of so-called subordinate staff in offices is also fast changing. When the plan to computerise land records is implemented, even village accountants will have to learn new skills.

Despite these radical changes, most advocates of reservations continue to argue in terms of general administrative posts only. They then talk of qualities of the heart required of these administrators. They forget that even when we appoint a typist we look for typing skills, not qualities of the heart.

How the government has handled the question of efficiency *vis-a-vis* reservations needs examination. First of all, it has exempted the defence services from reservations. The constitution itself seems to envisage this exemption. In part III on fundamental rights—the same part which makes special provisions for backward classes—article 33 states, "Parliament may by law determine to what extent any of the rights conferred by this part shall, in their application to the members of the armed forces or the forces charged with the maintenance of public order, be restricted or abrogated so as to ensure the proper discharge of their duties and the maintenance of discipline among them." This article seems to be a check on any possible attempt to introduce reservations for backward classes in the armed forces. In addition, there is a general consideration that defence of the country is so vital that the efficiency of the armed forces cannot be compromised for the sake of the policy of reservations for backward classes.

As regards civil posts, the ministry of

social welfare, the commissioner for SCs and STs, the joint parliamentary committee on the welfare of SCs and STs, the recently constituted commission on SCs and STs, and above all, the MPs and MLAs belonging to SCs and STs endeavour to enlarge the scope of reservations for SCs and STs. On the other hand, the ministries and departments controlling their respective posts as well as the department of personnel and administrative reforms try to meet the efficiency requirements of posts. Accordingly, posts can be exempted from reservations by special or general instructions issued by the department of personnel. Not only specific posts but also entire categories of posts and even entire departments and institutions have been exempted.

It is almost impossible to obtain information about inter-ministerial and inter-departmental exercises concerning desirability or otherwise of introducing reservations for posts in a certain department or institution as well as of granting exemptions from them. However, the power wielded by the concerned department or institution and by its lobby seems to be a major factor in deciding to reserve or to exempt. Moreover, a department or institution might stand exempted simply because the pro-reservation lobbyists had not taken initiatives to get reservations introduced into it.

I have not succeeded in my efforts to locate a comprehensive compilation of information on exempted posts. Probably such a compilation does not exist, as it was recently reported in the press that the government was refusing to provide information on exempted posts. One has, therefore, to depend on random bits and pieces of information. This information is, moreover, limited to reservation of posts for SCs and STs and that too mainly in the central government services. Although the states also exempt posts from reservation for OBCs due to considerations of efficiency, I have very little information about such posts. Despite these limitations, it would be useful to analyse available information.

A Handbook of Reservation for SCs and STs, recently compiled by two judges B D Purohit and S D Purohit (Jainsons, New Delhi, 1990, pp 79-91), shows that all scientific and technical posts in the departments of space, atomic energy, and electronics have been exempted. In other departments, scientific and technical posts belonging to grades above the lower grade in Class I service and satisfying certain conditions have been exempted. In Indian Airlines and Air-India no relaxation or concession in qualifications and experience is given while appointing pilots and high technical personnel. All scientific posts in the Indian Institute of

Science in Bangalore and the Centre for Chemical and Molecular Biology in Hyderabad have been exempted. In certain institutions of higher education, such as IITs, IIMs, and central universities, while reservations are made in non-academic posts, the teaching posts have been exempted, though pressures are now building up to introduce such reservations in central universities.

The courts have by and large taken the position that in the case of SC and ST candidates qualifications can be relaxed for posts at the lower level of bureaucracy. The judicial attitude is summed up in Krishna Iyer's comment supporting promotion of junior division clerks belonging to the SCs as senior division clerks in the case of *Thomas vs State of Kerala*: "After all, here is a pen-pushing clerk, not a magistrate, accounts officer, forest officer, sub-registrar, space scientist, or top administrator or one on whose initiative the wheels of a department speed up or slow down" (AIR 1976, SC 490:527).

One of the consequences of reservation of posts in an institution is disputes about allocation of the reserved number of posts between its departments or sections. For example, when a certain per cent of posts have to be reserved in a university, each department claims that it is more scientific or technical than others and therefore should be exempted from reservation. The disputes are then settled on non-academic grounds.

Exemptions from reservation raise several important issues. First of all, where and how do we draw the dividing line? On what basis do we say that an institute for physical science or technology should be exempted from reservations but not a university which also has departments of sciences and technologies. It is indeed curious that reservations exist in the teaching posts in institutions of medical education and research, including the All India Institute of Medical Sciences in New Delhi. Does this mean that medical sciences are less important than other physical sciences? Similarly, while the IIMs are exempted, why are the university departments of management studies not exempted? Furthermore, what is the rational argument for exempting posts in science and technology but not in economics, history, law and other social sciences and humanities? Do we accept the view that economists, accountants and auditors are less important than physicists, chemists, zoologists and botanists for the nation? In this post-industrial, post-modern, information age it would be ridiculous to argue that the so-called soft fields like language and culture are less important to the nation than the so-called hard fields like the armed forces and the

should we forget inter-sectoral linkages due to which inefficiency in one sector adversely affects efficiency in other sectors.

The argument in favour of exempting only higher posts from reservations needs to be examined carefully. Efficient performance of numerous tasks nowadays requires team work between all the members of a team, high and low. For example, in an operation theatre a senior surgeon requires not only a few junior surgeons but also a few nurses and other assistants. The efficiency of each one of them is crucial. The same is true of army battalions, scientific laboratories, factories, offices, and so on. It is well known that one of the frustrations of highly qualified scientists, doctors and other professionals in India is the poor quality of supporting staff. Secondly, it should be realised that many of the so-called lower jobs are becoming more and more skilled now. The day is not far off when most of Krishna Iyer's pen-pushing clerks will be replaced by computer operators. And thirdly, advocacy of inefficiency at the lower level of bureaucracy means open support to poor service to the public in all public service institutions, such as post office, bank, railways, and tehsildar's office.

The advocates of reservations, including judges, frequently argue that since minimum qualifications are always attached to posts, no harm would result

from reservation of a certain proportion of posts. This means a selection committee need not even aim at selecting the best of the candidates. This is like saying that since minimum marks are laid down for passing an examination, we need not award first class marks, prizes and medals. The fundamental issue is: should we value mediocrity by design? Or, should we value excellence—in every walk of life and at every level?

The central government has exempted from reservations a number of non-scientific and non-technical posts because of, to quote from the *Handbook of Reservation for SCs and STs*, "the exceptional circumstances and the special nature" of these posts (op cit, pp 81-83). Most of them are posts of private secretaries, assistant private secretaries, personal assistants, etc, to the prime minister and other ministers, to the Planning Commission members, and to the principal secretary and the special assistant to the prime minister. Those VIPs whose personal staff is not so formally exempted from reservations, manage to get the most efficient personal staff by transfer or by deputation. Such formal or informal exemption of personal staff of the VIPs from reservation indicates how the VIPs observe a double standard. This is not different from the advocates of local language as the medium of education sending their own children to English

medium schools and to foreign universities, and the advocates of 'swadeshi' going abroad for even minor surgical operations and that too at the expense of the government. Recently a central minister said openly that he would advocate reservations in the appointment of doctors in hospitals but would get his own surgical operation performed by the most efficient surgeon. It is also not uncommon to find academics advocating reservations in public forums but refusing to make appointments on the basis of reservation in their own institution or department.

Reservation of teaching posts in educational institutions violates a fundamental norm of education. (Reservation in admission of students is a different issue.) Every educational institution, including primary school, needs an environment of cultivating merit, if not excellence. Therefore, to compromise with merit in appointment of a teacher at any level is to subject his students, including those of backward classes, to mediocrity for the entire length of the teacher's service, i.e., a whole generation of students. How can we expect teachers who know that they have been appointed without merit, to enforce the criteria of merit in evaluating their students? And how can there be education without evaluation of merit? In fact, a teacher has to go on evaluating students every day, not just at the annual examination. To provide reservations in the appointment of teachers, therefore, amounts to planning for inefficiency in a sector of society whose essential function is to develop efficient human resources for society. It is indeed ironical to find academics supporting reservations in the appointment of teachers.

Efficiency or merit is not a fetish of the elite, as frequently alleged. It is in fact an essential ingredient in every field of life ranging from defence services at one end to information services at the other. The future course of nation's development will require increasing numbers of men and women with talent and skill in every department and at every level of government as indeed in every walk of life. Not only industry, commerce, the professions and other fields located in towns and cities but also agriculture and other aspects of village economy and society will require efficient administrative services. To believe that villagers do not care for efficiency is to grossly underrate their needs, perceptions and judgments.

Striving for perfection is a value in itself with deep roots in India's past, but it acquires special importance in the modern competitive world. If India is to survive as a nation in this world, it has to strive for highest standards of efficiency in every field and remove all barriers to efficiency.

Reservations for backward classes in jobs in government establishments and public sector undertakings are one of the major barriers. During the last 40 years or so, numerous distortions and aberrations have developed in the policy of reservations. Simultaneously, considerations of efficiency and merit in the interest of the nation as a whole have become overwhelming. The nation has reached a stage when it should seriously review the entire policy of job reservations for backward classes, just as it has reviewed the policy of nationalisation of industries and already taken steps towards privatisation. The policy of job reservations needs to be

replaced by effective programmes of affirmative action to promote efficiency, merit and skills among the weaker sections of society. Primary education and other programmes linked with it should receive the highest priority. Maximum attention should be given to the lowest levels so that affirmative action at the higher levels can also become effective. This does not mean we abandon the goal of social justice but use different methods to achieve the same goal.

[This is an enlarged version of my article in *The Times of India*, January 15, 1991. I thank B Sivaramayya for enlightening me on legal issue.]

A Saddam May Go, but Saddams Must Remain

Frederick F Clairmonte

The US formula is simple: we work on both sides of the street and all parts of the street. Saddam is no doubt to be shunned now, but it is necessary to find a Saddamite clone, preferably another Baathist Sunni dictator, that could dovetail with the requirements of US policy.

ALL is well, or so it seems. The general has apologised to his commander in chief whom he considers "a great man". No doubt his indiscretion will not prevent him from acquiring his fifth star.

Apologies may paper over the cracks, but the general's critique can be evaluated at many levels, strikingly so against the horrendous tragedy of the abortive Bush bankrolled and inspired uprisings against Baghdad's authority. In his television blast off, Schwarzkopf intoned that Bush's decision to end the 100 hour war was "courageous and humane", but went on to wax rapturously that his recommendation was "to continue the march... we could have completely closed the door and made it a battle of annihilation". The explicit implication if the war had been prolonged another 24 hours he could have clobbered Saddam, but Bush saved Saddam's bones.

Invocations to Bush's 'humaneness' by Schwarzkopf is comically irrelevant. For the New World Order has only one military superpower and its predilection is not human rights, democracy and humaneness, but the preservation and extension of the rights of Big Capital. Over the last two decades alone, successive US administrations have taken the belligerent lead in vetoing United Nations resolutions on aggression and international law.

An exemplary case history in its flouting of international law was the General Assembly's condemnation of the

violation of Panamanian sovereignty (December 29, 1989). To cite but paragraphs one and two of the indictment:

- (1) 'The General Assembly' *strongly deplore* the intervention in Panama by the armed forces of the United States, which constitute a flagrant violation of international law and of the independence, sovereignty and territorial integrity of states.
- (2) *Demand* the immediate cessation of the intervention and the withdrawal from Panama of the armed invasion forces of the United States.

Where are human rights in Panama today? Why has the US trampled on this resolution? Where are the promised financial handouts for reconstruction of this still devastated country? Always a neo-colony, the country is today hegemonised by an unconstitutional clique of earners, custodians of the interests of the 6 per cent white minority, ravaged by an unemployment tornado of 35-40 per cent, busted by rampant inflation, an ideal system engineered to be perpetuated by a permanent US occupation. Is Grenada any different?

Bush understands the logic of such depredation, after all, he was its architect. Indubitably, at a personal level he claims to be opposed to Saddam Hussein, but as with Noriega, he was a man with whom US institutions trafficked, and with whom his entourage had always been on congenial terms.

Saddam no doubt is to be shunned, but

what is presumably desirable is to find a Saddamite clone, preferably another Baathist Sunni dictator, that could dovetail with the requirements of US policy. The crux of his policy was articulated by Marlin Fitzwater, the presidential spokesman: "Iraq should remain a single country, since it's good for the stability of the region that it maintains its territorial integrity. We do not intend to involve ourselves in its internal power struggles." What stability are we talking about? For whom?

Since the advent of the Truman Doctrine what measures have US administrations deployed to ensure this 'stability'? The anti-Mossadeq coup of 1953? Creation of the Baghdad Pact? The unbending support of Israel in its obduracy to seek a just solution to the Palestinian issue? The answer is unequivocal: every US measure has crushingly contributed not to the region's stabilisation, but to its destabilisation.

Is the staggering arms race launched by Bush another artifice for promoting regional stability? Even before the Iraqi dead were precipitously bulldozed into their trenches to avoid a body count, the Bush cabal had already informed Congress that it intends to sell hi-tech weaponry worth \$18 bn to five Gulf states. When accorded Congressional benediction, the Export Import Bank will be authorised to guarantee commercial loans made to overseas arms buyers. And this while a civil war rages and hundreds of Kuwaiti oil wells are still burning.

The arms bazaar will thus continue to flourish in the 1990s as it did in the 1980s when West Asia absorbed a staggering \$120 bn of arms sales. The US is, of course, not alone; there are other big time arms pedlars foraging for a fast buck. Of all the major weapons bought by the third world in the second half of the 80s, around nine tenths originated from the Security Council's five permanent members, the bulk going to West Asia.

Bush cannot wiggle off the hook by turning Saddam into a scapegoat because it was he who incessantly instigated the Iraqi people to rise up against the man that he labelled "worse than Adolf Hitler". The upshot is millions of displaced persons, more tens of thousands of dead, and the abandonment of those who risked their skins in their striving to oust Saddam. Once again, the harsh reality of 'human rights' has nothing in common with the crassness of Bush's *machtpolitik*.

A point emphasised by A M Rosenthal of *The New York Times*, himself an establishment journalist of the far-right: "The foreign policy bureaucracy has shown repeatedly that its only real passion is for the *status quo*. Most American diplomats I've met do not consider pro-

moting human rights and democracy as important as foreign policy goals or national interests" (*The New York Times*, April 3, 1991). Circumvention of human rights, however, is not confined to the 'foreign policy bureaucracy' but extends to the entire political caste and the impresarios of US finance capitalism to whom 'human rights' are as delectable as a dried banana skin.

Compassion and assistance to the stricken Kurds is mandatory, but it should not obfuscate what is being done by Bush to promote himself and his electoral politics of 1992. The CIA's strategies were never intended to call a halt to the afflictions and atrocities perpetrated by several states against the Kurds. The marketing logic is rudimentary: sooner or later the Iraqis will be entering the arms bazaar, but the Kurds as a small minority, won't have the money to do so, or even if they had they still will not possess a firm geopolitical base.

The Lebanonisation of Iraq is thus anathema to the global multi-billion dollar arms bazaar. Recognition of this has not deterred the CIA (and others of its international fraternity) from manipulating the Kurds, and then selling them out at the appropriate moment when 'national interests' so dictate. Mustapha Barzani, a personal friend of Bush, was brought (with his son) to the US by The Company in 1975; he died in Alexandria, Virginia in 1979 at the time when Bush was actively engaged in The Company's business.

In William Casey's gripping formula: we work on both sides of the street, and all parts of the street. Bush, who understands the Kurd's ideological and tribal division, was not the first president to bamboozle them. Nixon pushed them aside at the Shi'is' request. In the multi-billion dollar credit deals with Saddam, Reagan recognised that the Kurds and their aspirations had no place on the US agenda, and this at the same time that he was pushing through the Iran Contra deals.

It is disingenuous to pillory Bush for loss of nerve and lack of a sense of moral purpose. Equally given the premises and co-ordinates in which Bush operates, such expletives as cynicism and hypocrisy are meaningless to explain his conduct, which remains perfectly consistent.

In the Treaty of Sevres (1920) the promise of Kurdistan was made in the ebullient wake of the break up of the Ottoman empire by the imperial duo, France and Britain. A honeymoon of short duration. The nationalist Kemal Ataturk was opposed to the idea, a stand that meshed with the annexationist thrust of British imperialism articulated by Lord Curzon.

Kurdistan's fate was sealed by the 1923 Treaty of Lausanne. The toad was swallowed. The petrol-rich vilayets (provinces) of Kirkuk and Mosul were grabbed by Britain, and attached to the newly created state of Iraq in 1925 in what was to become, in effect, a neo-British colony. By that time, Colonel T E Lawrence (1888-1935), that exalted servitor of Empire, had been transmogrified into Corporal T E Shaw of the Royal Air Force who pontificated that the time had come to write the Kurds' obituary which he did with that scathing sentence: "The Kurds are a people of the past".

As a military man, Schwarzkopf had only an exiguous grasp of the exigencies of imperial power in the Gulf. He failed to perceive the simple truth: that there are Saddams behind Saddams, that a Saddam may go but Saddams must remain. This is a political constant which, at no time, Bush and his imperial presidency have ever lost sight of.

The Compleat Angler

S R Sen

Between the IMF, the World Bank and the Aid Consortium, India today is caught in a vice with little freedom of action. Since the terms and conditions prescribed by the IMF and the World Bank suit the private interests of some of our own businessmen and politicians, it will be difficult to loosen the grip of the vice.

ANGLING, or fishing by bait, hook and line, is a popular sport in many countries, but specially in Britain and the US where it has been developed into an admired art. Isaak Walton's famous book *The Compleat Angler*, written three centuries ago, remains a revered classic in these two countries even today.

The Compleat Angler taught generations of Britons and Americans not only the fine points of the great art of angling or fishing directly but also helped them indirectly to achieve success in many other pursuits, which required careful strategic and tactical preparation, cautious waiting and very prompt action whenever needed. If the battle of Waterloo was won on the playing fields of Eton, many a successful business, diplomatic and hegemonistic ventures of these countries had their roots in the angling lessons learnt earlier.

How to attract even the wary fish to the angling area through disturbing action upstream and strewing 'chum' (or bits of fish food) and 'fly' near it, camouflage the 'bait' containing the 'hook', dangle it at the proper level through a 'sinker', keep a watch on it through a 'bobber', use a 'reel' and a long enough 'line' to give the needed 'play' to a strong fish and to tire it out by suitable moves are all considered to be essentials of this classic sport.

The word 'angling' has become an important element of British and American vocabulary and behaviour pattern. 'Angling' for attention or favour is, of course, a very common expression. Providing a tempting 'bait' to the guillible is another. Many shops periodically advertise concessional 'sales' of a few articles as 'chums'. When a shopper is attracted by these 'chums', he is clearly tempted to buy other non-concessional goods very attractively displayed side by side, goods which he had not thought of buying when first attracted by the advertisement. Banks and associated business houses often offer attractive loan, hire purchase and credit card facilities to enable a client to buy what he would not ordinarily buy and refrain from putting pressure for repayment of instalments due for some time, but after a suitable lapse of time when the interest burden has mounted sufficiently, 'haul up' the hapless client and force him to make

much larger payment than what he had originally bargained for. In Industrial take-over exercises, offering of 'baits' to selected key executives of the potential target firm as a preliminary step is fairly common. The same is true of exercises for ferreting out trade secrets of rival organisations in private business.

The bait of 'subsidiary alliance' which was offered two centuries ago by the East India Company to the Nizam of Hyderabad was a very sophisticated example of the art of angling by that semi-commercial and semi-military company in the field of diplomacy and warfare. The fear of Tipoo Sultan and his French ally was played upon by the Company to induce the Nizam to bite the bait of the British alliance and get so 'hooked' as to lose his independence eventually.

The success of this first 'subsidiary alliance' or 'foreign aid' was so great from the Company's standpoint that later it was extended to several other Indian princes paving the way for establishing British hegemony over the entire Indian sub-continent. When some of these princes were initially reluctant, situations were so created in their neighbourhood that they could not decline such an alliance. The 'subsidiary alliance' was indeed the classic case of 'foreign aid' which was the precursor of many other similar 'aid' exercises (and in some cases of hegemony) during the next two centuries both in India and other parts of the world.

The role of the United Fruit Company in Central America, ITT in Chile and the oil companies in West Asia are some examples of private enterprise in this direction.

The 'aid' that the young and pliable Shah of Iran received against Mossadegh, Khomeini received against the older and overbearing Shah, a weaker Saddam Hussein received against domineering Khomeini and the vulnerable Arab 'oil' states received against an ambitious Saddam Hussein are but recent variations of comparable practice by a superpower.

RECENT INDIAN EXPERIENCE

In the early years after independence, the Indian leaders recalled the history of the earlier 'subsidiary alliances' and were reluc-

tant to accept any 'foreign aid' except to a small extent and under their own terms. The US and Britain, in their anxiety to build up a cordon *sanitaire* around communist USSR and China, pressed 'aid' upon India. Aid to Pakistan was used as a lever to persuade India to accept some economic, if not military, aid. This economic aid, *inter alia*, was expected to serve the purpose of overcoming India's strong position in NAM and giving entry to American and British 'experts' to key Indian officials. When after the cut off of US aid during the Bangladesh episode, India expressed a desire not to accept any further aid from the US, the latter insisted on India taking at least a token aid of \$ 25 million. A reason, privately given, was that the US wanted to maintain through this token aid some continuing relation between US and Indian officials.

When the rift between China and Soviet Union became apparent, China was offered substantial technical and economic aid. Over the years, this paid good dividend to the US. India's position became somewhat weaker. After the recent troubles in the Soviet Union, India's value in international power politics has become even less.

In the fifties, when India was still reluctant to accept large bilateral aid and seemed to favour multilateral aid, World Bank and IMF started giving loans to India in a big way. A new concessional loan window, IDA, was opened in the World Bank, keeping the needs of India specially in mind. An innovative measure, a 'consortium' of both multilateral and bilateral aid agencies, was devised to take care of the needs and susceptibilities of India.

In the first few years of the 'consortium' the US pressed other countries to step up their lending to India. In the next phase these other countries pressed the US to step up its lending to India. Currently, all the members of the 'consortium' have combined to form a virtual cartel to force India to subordinate its own preferences to their terms and conditions for loans. Competition which is prescribed for 'trading' is avoided for 'lending'.

Like a strong fish, India struggled for a fairly long time against being 'hooked'. Once or twice, the 'hook' scraped through the skin or the 'line' broke. But as years passed, the 'hook' pierced deeper and the line was pulled up closer. With each natural or contrived crisis, especially during the last four or five years, India seemed ready to accept increasingly stiffer conditions and even to be 'hauled'.

The World Bank and IMF are undoubtedly international organisations with boards of directors and staff in which India has also a representation. But with the system of weighted voting, it is only three or four developed countries led by the US who call the tune. 'What the American Congress will

'favour' is often the main preoccupation of the senior officials of the World Bank and IMF.

During the McNamara era, the World Bank retained some independence. In spite of Nixon's strong opposition, the board of directors of the bank could be persuaded by India to continue loans to India during the Bangladesh episode and re-elect McNamara for a new term of five years. But after McNamara, the bank has come under almost complete domination of US government. There are undoubtedly a few vice-presidents from developing countries in the bank but their selection and behaviour pattern are more like those of the Indian 'show-pieces' in the British Viceroy's Executive Council than of real representatives of the people.

The subservience of most other developing countries is often even worse. The arrogance of some of the World Bank and IMF officers, especially from developed countries, *vis-a-vis* the smaller countries has to be seen to be believed. They are sometimes worse than the pro-consuls of Britain when the Empire was at its zenith. Among them sympathy for the borrowing countries is often criticised as 'clientitis' and there is competition as to who can impose stiffer terms.

CONDITIONALITIES

When 'foreign aid' was being given to the developed countries of Europe, by the US as well as the World Bank and IMF, the terms were very easy and conditionalities minimum. When 'aid' for the developing countries was started, particularly for India, these were gradually tightened but still continued to be reasonable for several years. But later they became progressively more stiff. India continued, however, to enjoy the benefit of some of the earlier easy terms until the eighties. With the Reagan and Thatcher era, India steadily fell from grace.

With the present foreign exchange crunch, part of which has resulted from India's own shortsighted policies during the last five years, especially during 1990, some of the favourable terms which India enjoyed earlier have virtually disappeared. Between IMF, World Bank and the Consortium, India today is in a vice as it were with very little freedom of action of its own. Since the terms and conditions prescribed by IMF and World Bank suit the private interest of some of our own businessmen and politicians, the grip of the vice seems almost inescapable.

Compared to IMF and World Bank loans, those from the international money market have higher rate of interest but much less conditionality and take much less processing time. If a shadow price is ascribed to these last two, the difference between IMF/World Bank and commercial loans would work out to be substantially less than the quoted interest rates. The recent downgrading of India's credit rating is partly due to ephemeral political causes and not basic

economic reasons and can be corrected with a well calculated policy. It will not be wise to rush and bite without careful scrutiny a dangled 'bait' which may eventually make our plight worse.

Of course, in statecraft sometimes risk has to be taken. But this should be calculated risk.

If India simultaneously takes effective export production and promotion measures and dampens domestic demand for more important exportable goods through heavy excise duties with prompt drawbacks for exports, there should be no harm in its borrowing large amounts from IMF under the softer tranches and from the World Bank under old style programme and project loan facilities. If necessary, these could be supplemented by offering attractive terms for NRI investment and also borrowing from the international money market for specific productive projects. In fact one need not worry about the total volume of foreign loans so long as one can ensure that these contribute to net foreign exchange earnings. Such loans represent largely the innocuous 'chum' and not the 'bait' hiding a 'hook'.

But India needs to be specially cautious about (i) foreign market borrowing for non-productive purposes, (ii) loans under the stiffest tranche of IMF and (iii) structural adjustment loans from the World Bank.

In particular, India would do well to study carefully the unhappy experiences of some of the countries of Africa and South America. For example, Nigeria was persuaded by the World Bank to accept a large structural adjustment loan in the mid-eighties. Even after more than four years of intense

adjustment pain caused by this bitter medicine, the end of the economic sickness is not yet in sight while the tormenting side-effects in the shape of social and political trouble in a country full of vulnerable groups is already being felt. The supposed safety net proved in practice most inadequate.

India should also recall its own painful experience in the wake of the devaluation of 1966, when both the US government and the World Bank failed to secure the approval of the US Congress for the loan package recommended to and accepted by it.

As a fish cannot afford to do without food simply for the fear of a hidden 'hook' in one of the pieces of 'chum', India cannot also obviously afford to forgo all foreign loans for fear of a possible catch in one. But it should follow a policy of austerity when faced with risky waters, avoid greed and take every possible care that a 'hooked bait' is not mistaken for a harmless 'chum'. If per chance, however, it happens to make such a mistake, it should not swallow the 'hook' so much that it cannot get rid of it later through some effort. If this latter is not feasible, it should try to develop enough capability to bite through the 'line' itself and get away.

This kind of circumspection is much more needed today in India than ever before. But the requisite call for austerity, the 'export or perish' slogan and grit are still unfortunately missing.

Indeed, a time has come to counter manuals by Walton and his followers for the 'angler' by equally good manuals for defensive action for those who run the risk of being 'angled'.

THE GUJARAT INSTITUTE OF AREA PLANNING

Sarkhej-Gandhinagar Highway
Gota - 382 481, District Ahmedabad

The GIAP offers some Visiting Faculty positions at the level of Professor/Reader or Senior Lecturer for six months to two years. Scholars must be interested in work on population dynamics, employment/unemployment, poverty, education, health economics, agro-industrial interrelationships, resource economics, and development. Scholars must have a good post-graduate degree (preferably a Ph.D.) in Economics, Sociology, Anthropology, Demography or Education and demonstrated capacity for independent research.

Remuneration would be fixed according to qualifications and experience within the UGC scales. Selected scholars from outside Ahmedabad will be eligible for suitable housing and a special transportation allowance to facilitate temporary shift.

Please write to the Director with detailed curricular vitae, names of three professional referees, copies of three "best" papers or publications, and a work plan (or willingness to associate with Institute's on-going projects) by August 19, 1991.

Religion, Communal Identities and Communal Violence

Balraj Puri

Communalism and Communal Violence in India by Asghar Ali Engineer; Ajanta Publications, New Delhi, 1989; pp 344, Rs 250.

COMMUNAL violence is not only the weakest aspect of the Indian polity but also of Indian scholarship. Its growing frequency and intensity defy the riot controlling state agencies as well as the analytical tools of social scientists. A secular Constitution framed on the basis of a long liberal and tolerant Indian tradition, humanitarian instincts of the common man, committed peace activists, concerned intellectuals, not to speak of a powerful state machinery and numerically far larger following of the self-proclaimed secular parties have failed to build up defence against the rising tide of communal violence.

Asghar Ali Engineer, in the book under review rightly argues that the age old theory of communal riots which puts the blame on the British policy of divide and rule or ascribes it to the colonial policy of underdevelopment of the economy "is no longer adequate to explain comprehensively the complex nature of communal violence today". One might, in fact, question his assertion that "the theory had its full validity then". Perhaps even then it had only a partial validity.

Criticising the tendency to use a simplistic theory or an oversimplified hypothesis to explain away what is a most complex phenomenon, the author attempts to develop a broad theoretical framework, for the purpose. He has indeed excellent credentials for the task. He is not only a scholar of repute, with deep knowledge of religions, particularly of Islam, he has also done a large number of empirical studies on communal riots in post-independence India. His commitment to secular values and objectivity, too is beyond doubt. Study of communal violence is for him, as the blurb says, more than an academic exercise, it is a mission for him.

While developing a macro theory of communal violence, the author also provides for micro specificities on which he has collected a lot of evidence, appended to the book. Perhaps a more rigorous exercise could use this evidence for evolving a coherent and comprehensive theoretical generalisation.

The relationship between religion, communalism and communal violence are the basic key to his theory. Religion is, according to him, a force to be reckoned with in India, firstly, because it is a poor and backward country. Secondly, alienated insecure urban people seek psychological compensation through religion. Further, religious operators develop their political links. "The scenario is thus complete for religious fundamentalism to play its political role"

It is not only a poor and backward country in which the role of religion is becoming

important. Religion continues to be important in American lives—far more important, as Kenneth Wald notes, than politics. Charles W Dunn similarly observes that "religion has become more important in the lives of Americans as religious issues have entered the political arena in unprecedented fashion".

An American's need for "a sense of certainty and community within the larger society's insecurity and impersonality" [Robert Booth Fowler] must, in fact, be greater than that of an Indian. One must not be either apologetic or seek special explanation for what Asghar Ali calls religiosity of Indians. On issues like family planning, abortion and Darwin's theory, there has, for instance been absolutely no organised resistance from religious quarters as is the case in America. It is not possible to find any support in the "cascade of books and articles recently published in America on issues involving religion and politics" [Mark A Noll] to Asghar Ali's assertion that "there is no place for use of religion or religious identity for political purposes as far as the west is concerned".

However, the author distinguishes between opportunist and creative use of religion. He also affirms that religion is not the root cause of communal conflict. Communalism, according to him, is all about secular issues without involving any religious sectarian doctrine. He defines communalism as achieving secular goals through religious channels. He also makes a very pertinent distinction between faith as an ideology and as an identity.

The Muslim League was, for instance, concerned with secular interests of the Muslim identity i.e. share in power and employment. It did not at all bother about doctrinal or religious problems of Islam. Similarly the Akali Dal to start with was concerned with secular problems of Punjab or the Sikhs e.g. formation of a linguistic state, share in river waters and claim over Chandigarh.

In an ideological or theological sense religion has much less to do with politics in India than it does in the west. Engineer, therefore, rightly argues that neither was the Muslim League led by a 'mullah' nor the Hindu Sabha by a 'shankaracharya'. But he does not draw a distinction between communalism and fundamentalism and often uses the terms interchangeably. In communal politics, religious doctrines and personalities do not matter. But as fundamentalist trends start emerging, 'imams' and 'shankaracharyas' are becoming politically relevant.

In analysing the politics and religion of

the two major communities, the author, in order to maintain his impartiality, tries to keep the scales even. He quotes Tara Chand at length to show how much affinity there is between the two religions. He also cites much evidence to show a great deal of intolerance, even brutalities and barbarism committed by the Hindus.

The fact however, is that Hinduism and Islam are not comparable religions; unless the current process of semitisation of the former really succeeds. The attempt to prove the eventual unity of all religions as Gandhi and Azad did or find out affinities between Hinduism and Islam, as Tara Chand did, have no relevance to either the communal situation or to the understanding of the two religions. The diversity and range of Hindu philosophical thought—with almost no scriptural authority for socio-political behaviour—sharply contrasts with the precise theological and socio-political character of Islamic beliefs.

Theological and philosophical differences, between Hinduism and Islam are not the cause of any conflict between them. It is due to the blurring of distinctions between Hindu religion and the ancient history, civilisation and mythology of India that it almost projects itself as a religionised version of Indian nationalism. It is the attitude of the two communities towards nationalism that is the real source of confusion. For Hindus Bharat Mata is the most sacred goddess which is not merely a political concept but also has a religious and spiritual significance. Hindus are tolerant of the religious beliefs of Muslims but tend to find them wanting in their emotional allegiance to the most sacred Hindu goddess and mythological heroes.

The author comes nearer the truth when he differentiates between religious and political intolerance. But there is need to go deeper into the roots of political intolerance of Hindus. As they are in a majority and as nationalism is almost a religion for many of them, even liberals among them find it difficult to appreciate the urge for a distinct identity among Muslim and Sikh minorities.

Again, the author's attempt to find similarities between majority and minority communalism which "feed and fatten" each other is an oversimplification. For majority communalism tends to acquire a nationalistic fervour and develops affinities with fascism whereas minority communalism tends to be particularistic and separatist. A separatist particularistic brand of Hindu communalism was always a marginal phenomenon whereas it represented the Muslim mainstream and demanded partition of the country; more as a reaction to the assimilative character of Congress nationalism than to the communalism of a non-entity like the Hindu Maha Sabha.

Anyhow the author makes a valid distinction between religious consciousness and communal consciousness. One may not lead to the other. Gandhi and Azad were thoroughly religious but not communal. Jinnah and Savarkar were least religious but communal.

Under what circumstances and due to what reasons does one consciousness lead to the other?

The author bases his theory on "dynamics of economic development and social change, accompanying it" The capital path of development, according to him, generates ethnic and communal conflict because it is uneven and accentuates exploitation and injustice. It is truer of the developing third world countries where a sense of primordial identities (caste, communal or ethnic) prevails over class identities. As secularism and democracy are bourgeois ideals necessary for developing a capitalist society, he implies, the problems these ideals are facing are inherent in capitalism.

Obviously the theory was developed before the Gorbachev revolution in the Soviet bloc which demonstrated the autonomy of ethnic and religious identities from economic and political systems and their stronger pull than class identities even in a 70-year old socialist system. And as convincingly argued by Nathan Glazer in *Beyond Melting Pot*, a developed country like the US is far more congenial for growth of ethnic identities than the developing third world. If economic deprivation and exploitation led to alienation of communities, the Sikhs—almost the richest community of India—would have been the most contended and integrated.

At one stage, in one of the articles included in the book obviously written much later the author concedes that there is basically nothing wrong with communal identities which must be respected even encouraged. Assertion of communal identity is a universal phenomenon both developing and developed countries experience it he adds.

Alas, the idea is not developed further and its implications have not been worked out. Some of the relevant questions are: What should be the sphere of autonomy of the communal identities? What should be their relation with one another, with other types of identities and the national identity? And above all, when does a communal identity cease to be benign and become malignant?

The author sets store on the role of the politicians to connect the loose ends of his thesis. They are told, carefully cultivate religious orthodoxy which in turn is used for promoting communalism and which in turn is used for provoking communal riots. "In the ballot box oriented democracy, they can hardly resist the temptation to manipulate the caste and communal sentiments for winning elections."

The statement, in fact, begs the question: Why do caste and communal sentiments matter in winning elections? If a politician is to remain in business, he must take cognisance of the prevalent sentiments. And if democracy is to prevail, how can ballot box be avoided? In every pluralist democracy parties and candidates are supposed to cultivate and manipulate permutations and combination of ethnic groups to ensure their victory. To expect Indian voters, politicians and the democratic system to behave differently is either utopian or hypocritical.

It is the realisation of this reality that makes the author pessimistically conclude that communal violence cannot be completely contained in our society. "We will have to live both with communalism and communal violence for quite sometime to come." When a person like Asghar Ali Engineer—a crusader for and scholar of communal peace—comes to this conclusion, one cannot help feeling a sense of despair.

As the book is a compilation of articles of the author written at different points of time and for different types of audience, there is not only an inevitable repetition but also occasional incoherence. However, piecing together some of his arguments in different parts of the book, it is possible to arrive at a less pessimistic and more positive conclusion.

He has conceded that religion is not the main cause of communalism. Similarly communalism should not be treated as the sole cause of communal violence. It is also a product of the atmosphere of violence which has grown independent of communalism. Further, if we replace the pejorative term communalism by a value neutral term communal identity it can be argued that recognition of communal identities and proper articulation and satisfaction of their aspirations should be a better way of promoting communal peace.

The author provides another vital clue to the analytical and prescriptive study of the problem when he marshals evidence of the fact that Muslims are a part of regional cultural mainstreams. Locally integrated communities do provide a durable basis for building an edifice of a nation. But the

model of nation building that attempts to integrate every community directly with an elusive national mainstream often tends to disrupt grassroots level integration of communities.

It has not been sufficiently realised and Asghar Ali, too, does not squarely face the fact that Indian nationalism is too inadequate a force to unite the nation whereas some of its expressions are a positive threat to national unity. While there are plenty of common symbols at the regional level, they are only a few at the national level. Bhagwan Ram may be accepted as a national hero but is it fair to expect Muslims to worship him as 'bhagwan'? The only way to unite the country is to supplement the appeal of nationalism with common super national ideals and regional sentiments.

The role of ethnic identities in promoting national unity has not been properly appreciated in India. So is the case with religious and communal identities. They are not only a part of the Indian reality which cannot be dismissed but are also capable of making a positive contribution to national life. Moreover, religion, communal identities and communal violence may be related but are also autonomous.

A study of the inadequacies of Indian nationalism, its relationship with communal and ethnic identities has vital relevance for the future of Indian civilisation, Indian democracy and Indian unity. But the task is so complex and daunting that even the best works on the subject do not seem good enough to meet the challenge of the situation. And Asghar Ali's work is certainly among the best.

New from **SAGE** Publishers of Professional Social Science

COPING WITH SEASONALITY AND DROUGHT

MARTHA ALFER CHEN

Rural households particularly in the semi arid areas of India routinely plan for and manage the uncertainties associated with regular seasonal fluctuations and periodic drought induced crises. These uncertainties pose particular hardships for the poor who are extremely vulnerable in terms of their access to resources. This study describes and analyzes the strategies adopted by different types of households to cope with seasonality and drought in a village in a semi arid region of Gujarat state in western India.

In analyzing the village, its people and its human and natural resources—remaining sensitive to local realities and never losing touch with practical problems that dominate everyday life in village India—Dr Chen has produced an important work which advances our understanding of the dynamics of poverty in rural India. As such, this book will be of great interest to all those interested in women, poverty and rural development.

Indo-Soviet Trade and Technology Transfer

Bernard D'Mello

India and the Soviet Union: Trade and Technology Transfer by Santosh Mehrotra; Cambridge University Press, Cambridge, 1991; pp xvi + 242, £ 30 (hard bound).

THE Soviet Union is presently in the midst of restructuring its foreign economic relations. A book which deals with Indo-Soviet trade and technology transfer upto the mid-1980s should provide an opportunity to assess the past economic relations between a centrally planned economy and a developing capitalist economy at a time when the former is on the threshold of major structural changes. The book under review is the outcome of the author Santosh Mehrotra's doctoral thesis at the economics faculty of the University of Cambridge. Its scope is quite comprehensive, but, perhaps because of its wide canvas, the analysis lacks in depth, particularly on technology transfer.

The book is divided into three parts. Part I covers the influence of the Soviet Union's central economic planning on India's development strategy, the geopolitical and ideological factors influencing Indo-Soviet economic relations and the Soviet Union's economic interest in non-'socialist' LDCs. Part II encompasses Soviet aid and technology transfer in building industrial enterprises in India. Part III deals with bilateral payments and bilateral trade (trade diversion, commodity composition, stability of export earnings and terms of trade). It is not possible for us to comment on all these dimensions of Indo-Soviet economic relations and so we will restrict ourselves to technology transfer and some aspects of trade relations.

Mehrotra chooses to cover almost all the industries in which Soviet technology transfer is supposed to have taken place—heavy electricals; heavy metallurgical and mining machinery, steel plants and steel plant design, oil exploration and production, petroleum refining, pharmaceuticals and surgical instruments. The publishers claim that these are 'illuminating and detailed case studies' of technology transfer. In my view however the case studies fail to illuminate this area of darkness and they are far from detailed. The story of the atrophy of Heavy Engineering Corporation's or Mining and Allied Machinery Corporation's technological potential is far more complex than can be surmised from the information put together. Neither can Bharat Heavy Electrical's relative success be adequately understood from the information the author has provided.

Technology is knowledge, skills, methods and procedures which are materialised or embodied in designs, specifications, operating instructions, machinery and equipment, etc. Acquisition of the embodiments of technology need not necessarily mean the acquisition of the technology itself. This

distinction is important, for technology suppliers often transfer the embodiments of technology without transferring the technology itself. The author seems to have erroneously equated 'transfer' of designs with 'transfer' of 'know-why'.

Mehrotra examines firm level contracts without adequately setting out the framework within which these contracts were functional. Actually negotiations first begin at the inter-governmental level where the Soviet side is represented by the State Committee on External Economic Relations. Inter-governmental agreements are entered into to coincide with India's five-year plans. These agreements list the plan projects for which Soviet collaboration is envisaged and set out the broad parameters for the same, like the scope of Soviet collaboration, the basis of pricing, etc. This is the basic framework within which inter-firm level contracts were entered into. For instance, in steel there is the Soviet firm Tiazpromexport which negotiates and transacts on behalf of all the concerned Soviet enterprises and institutes (Gipromez, Gipromkoks, etc) for undertaking a particular project. Unresolved differences at the firm level are resolved at the inter-governmental level. Mehrotra calls the firm level contracts 'near-turnkey contracts'. Actually, there are a whole host of separate contracts like those for export of hardware, licence agreements, technical 'assistance' contracts, training contracts, engineering consultancy contracts, R and D assistance contracts, construction supervision contracts, etc.

The case studies of technology transfer are bare outlines but here too there are factual errors. For instance, while the Central Engineering and Design Bureau (CEDB) of Hindustan Steel had arisen in association with the Krupp-Demag combine at the Rourkela Steel Project, the same is not true about the role of the British Consortium ISCON at Durgapur Steel Project [p 102]. Indian personnel were not associated in the design work at the one-million-tonne stage of Durgapur as in Bhilai or Rourkela. Another factual error is that the four million tonne stage of "Bhilai and Bokaro are almost entirely indigenously supplied" [p 104]. For instance, the fourth quarter 1981 capital cost figures for the Bhilai four million tonne expansion show the *direct* import content of equipment for the continuous casting plant and plate mill to be 63.8 per cent and 30.4 per cent respectively. The overall *direct* import content of the equipment costs in a 1983 estimate was 15 per cent. Also, *indirect* import contents in the form of completing equipment supplied

to HEC to fulfil its equipment supply contracts are said to be quite significant. Another factual error is the assertion that the Basic Oxygen Furnace or LD Converter "was pioneered in Asia for the first time in Rourkela in the late fifties" [p 109]. Actually, Japan was the first Asian country to adopt the process [UN Economic Commission for Europe, *Comparison of Steel Making Processes*, 1962, pp 78-81].

An important aspect of Soviet collaborated projects is that, in the 70s, particularly when India attained a comfortable level of foreign exchange reserves, a switch to western collaborations began. This was due, among other factors, to a realisation that the level of Soviet technology was inferior to western technology. The author does not adequately stress this important transition in his case studies of BHEL, HEC, or MAMC. There are many advantages that these firms perceived in switching over to western collaborations. For instance, the likelihood of reorganisation and rationalisation of their production processes, superior technology, ability to face competitive threats, improved chances of getting contracts where global tenders are invited, etc.

Regarding bilateral trade, I have the following comments: (1) I think that so-called trade diversion by India is a non-issue for much of India's exports to the Soviet Union is undertaken by India's private sector and private business will export to those countries where exports are more profitable. (2) The use of coefficient of variation in comparing the instability of India's export earnings from the USSR and the rest of the world is problematical. There is no way of carrying out a test of significance since the distribution of Σx^2 is not known. Also, a comparison of stability of export earnings is meaningful only if the proportions of exports of the particular commodity going to the USSR and rest of the world are not too widely different. In the case where the proportion of exports going to the USSR is, say, 1/10th of that going to the rest of the world, a comparison of the instabilities of export earnings (following the author's methodology) is meaningless. (3) Studying the terms of trade with unit value indices over 1970-71 and 1981-82 when there have been changes in the commodity composition would mean that one would find a change in the terms of trade even if prices of the traded goods had not changed much. (4) More manufactured goods exports to the USSR would actually result in a net outflow of hard currency since these goods have significant hard currency import content.

Before concluding, I cannot help but mention a factual blunder on the first page of the first chapter [p 9]. The author states that the famous 1944 Bombay Plan was produced by the National Planning Committee of the Indian National Congress! He further goes on to say that Bose and Nehru were among the authors of the Bombay Plan! However, this part, the book should be of interest to development economists, international economists and to economic administrators.

Income Inequality and Elasticity of Personal Income Tax

Pawan K Aggarwal

This paper develops a technique for estimating the effect of a change in inequality in the distribution of income on the yield of personal income tax. The technique is applied to estimate the effect of income inequality on the yield of personal income tax in India. It is found that, for a given tax schedule, an increase (decrease) in inequality in the distribution of income among the taxpayers increases (decreases) yield of personal income tax in India. Further, the study brings out that in India, during 1966-67 to 1983-84, inequality in taxable income was marked by a declining trend, and this had substantial negative impact on elasticity of the tax. Had the inequality remained unchanged, elasticity of the tax with respect to gross domestic product would have been around 1.49 instead of 1.17.

Government policies directed at mitigating inequality in the distribution of income seem to dampen growth of yield of the personal income tax. This is an important factor that should be explicitly taken into account in the tax revenue forecasting exercises. If the inequality is expected to decline at a rate lower than that in the reference period, then the effective elasticity would be in the range of 1.17 to 1.49, and if it is expected to decline at a rate higher than that in the reference period, then the effective elasticity may be well below 1.17.

I Introduction

MITIGATING inequality in the distribution of income and imparting built-in flexibility to the tax system have been among the main objectives of the government of India. These objectives may, however, come into conflict with each other. A declining (rising) trend in inequality in the distribution of income may have a negative (positive) impact on built-in flexibility or elasticity¹ of the personal income tax. In estimating elasticity of the tax, no attention has generally been paid to the trends in inequality in the distribution of income. The results of select studies on income elasticity of the Indian personal income tax by Sahota (1961), Gulati (1962), Cutt (1969), Jain (1969), Nambiar and Joshi (1974), Srivastava (1975), Gupta (1975), Rao (1979), Khadye (1981), Gupta and Aggarwal (1982), Bagchi and Rao (1982), Aggarwal (1984), Rao (1987), and Bagchi (1988) are given in Table I classified by the methodologies adopted. None of these studies quantifies the impact of inequality on elasticity of the tax. The purpose of this paper is to fill this gap.

The study reveals that in India during 1966-67 to 1983-84, inequality in taxable income was marked by a declining trend and this had substantial negative impact on elasticity of the personal income tax.

The study requires estimation of income inequality and elasticity of the tax. Methods of estimation of elasticity are reviewed in Section II. The constant rate-base method of estimating elasticity that has been adopted in this study has been modified to account for variation, over time, in the distribution of income within the income classes. The modified method is described in Section III. Section IV indicates data

limitations and suggests remedies. Choice of reference period, coverage and choice of rate structure are indicated in Section V. Working of the series of hypothetical tax revenue at the rate structure of 1983-84 is presented in Section VI. Estimates of elasticity are presented and discussed in Section VII. Section VIII contains conclusions of the study.

II Methods of Estimation of Elasticity: A Review

Estimation of elasticity involves capturing that component of the tax yield which can be considered as automatic growth at a constant tax structure. Historical tax yield comprises the tax yield at a constant tax structure and the effect, on tax yield, of the discretionary changes brought about in the tax structure during the reference period. Various methods of estimating elasticity of a tax have been discussed in the literature. These are based on capturing the automatic growth in tax yield at a constant tax structure from the historical tax yield or estimating the hypothetical tax yield at a constant tax structure or adjusting the estimate of buoyancy² of the tax.³ All these methods can be said to have a common conceptual framework.

In general, tax yield (T) can be said to depend mainly on the tax base (B), index of inequality (II) in the distribution of tax base, and the tax rate structure (R). Further, the tax base can be said to depend on the national income (Y) and the tax structure. Tax structure can affect the tax base mainly through the level of exemptions, deductions and marginal tax rates. Exemptions and deductions are inversely related to the tax base. With a higher exemption limit, lesser number of persons fall within the purview

of the tax and a lower proportion of total income of different taxpayers is subject to the marginal rate schedule. Marginal tax rates may affect the tax base through their effect on work effort and tax evasion. The tax yield model can be written as

$$T = f(B, II, R) \quad (1)$$

$$B = f(Y, R) \quad (2)$$

In the reduced form, the tax yield can be expressed as

$$T = f(Y, II, R) \quad (3)$$

Inequality in the distribution of tax base may be measured in terms of Gini index or by any other measure of inequality. However, specifying by a single variable, a tax structure with many marginal tax rates, exemptions, deductions and credits, etc, is a difficult task. To overcome this complex problem, a number of techniques have been used in the literature which give rise to different methods of estimation of elasticity of a personal income tax. Various methods of estimation of elasticity of a tax can be classified into the following three broad categories:

- (i) Those based on direct estimation of elasticity
- (ii) Those involving estimation of hypothetical series of tax revenue at a constant tax structure
- (iii) Those based on adjustment of estimate of buoyancy of the tax

Methods based on direct estimation of elasticity of a tax use relation (3) with observed series of tax revenue. However, it has generally been estimated without inclusion of inequality variable. This category of methods includes those based on (a) the use of tax rate and base variables, pursued by Wilford (1965), Ray (1966), Legler and Shapiro (1968), Muskin and Lupo (1967), and Srivastava (1975), (b) use of dummy

variables for the years of major discretionary changes, developed by Singer (1970), Chelliah and Chand (1974) and Wasylenko (1975); and (c) cross-section of groups of taxpayers by income as proposed by Mishan and Dicks-Mireaux (1958), Blackburn (1967), and Pechman (1973); and by region as advocated by Tanzi (1969) and subsequently applied in various studies including Anderson (1973), Tanzi (1980) and Rao (1987). The methods based on tax rate and base variables may not be thought appropriate for two reasons. First, representing a multi-rate tax structure by a single adequate tax rate is not an easy task. Second, while the use of base variable is presumed to capture the effect of discretionary changes, it also captures effect of non-discretionary changes as the base may change in spite of an unchanged tax structure. Srivastava (1975) suggests use of two parameters instead of a single tax rate variable, one parameter representing initial rate and the other representing incremental factor in the tax rate as one moves from a low-rate bracket to a high-rate bracket. However, interpretation of two-parameter representation of the multi-rate personal income tax is not unambiguous. The technique of dummy variables allows capturing generally the constant shifts in tax revenue and is beset with problems of potential multicollinearity. The methods based on cross-section data assume that the relationship between average tax liability and average taxable income across income classes or regions is the same as the relationship for the country as a whole at those levels of taxable income. This assumption does not seem to hold good in reality.

Methods involving estimation of series of hypothetical tax revenue at a constant tax structure use relation (3) with series of hypothetical tax revenue instead of observed revenue and with exclusion of tax rate variable. This, however, has also been generally estimated without inclusion of inequality variable. Methods in this category differ with respect to the process of obtaining series of hypothetical tax revenue. Various methods developed for obtaining the hypothetical series include (a) proportional adjustment method developed by Sahota (1961) and Prest (1962), the characteristics of which have been studied in detail subsequently by Chelliah and Chand (1974); and (b) the constant rate-base methods.

The proportional adjustment method assumes that the revenue effect of a discretionary change and the tax yield exclusive of the effect of the discretionary change grow at the same rate. If this assumption is not satisfied with respect to a major component of resource mobilisation, then application of proportional adjustment method may give a distorted series of hypothetical tax revenue. Further, the quality of the series of hypothetical tax revenue would greatly depend on the quality of the estimates of revenue effects of the discretionary changes brought about during the reference period.

The constant rate-base methods differ

with respect to the degree of disaggregation of the data. These include those suggested by Auld (1971), Lewis (1962), Pearse (1962) and Wasylenko (1975). The methods used by Lewis and Auld are based on highly aggregated data. The method used by the former is based on the application of a single tax

rate in the previous year to the tax base in the current year and that used by the latter is based on the application of a single effective marginal tax rate in the previous year to the change in the tax base in the current year. Methods advocated by Pearse and Wasylenko are based on data grouped by in-

TABLE 1: RESULTS OF EARLIER STUDIES ON INCOME ELASTICITY OF THE PERSONAL INCOME TAX IN INDIA

| Methodological Category/Study | Reference Period | Estimate of Elasticity | Remarks |
|---|--------------------|------------------------|--|
| 1 | 2 | 3 | 4 |
| <i>A Estimates Based on Proportional Adjustment Method</i> | | | |
| Sahota (1961) | 1951-52 to 1957-58 | 0.56 | Based on data for first and last years of the reference period |
| Cutt (1969) | 1955-56 to 1960-61 | 0.50 | |
| | 1960-61 to 1964-65 | 0.65 | |
| Rao (1979) | 1960-61 to 1973-74 | 0.76 | With three sets of estimated revenue effects of discretionary changes ¹ —do— ² |
| Khadey (1981) | 1960-61 to 1974-75 | 0.77 | |
| | 1960-61 to 1978-79 | 0.88 | |
| Gupta and Aggarwal (1982) | 1961-62 to 1975-76 | 0.93 | |
| Bagchi and Rao (1982) | 1965-66 to 1979-80 | 1.08 | |
| Aggarwal (1984) | 1970-71 to 1981-82 | 0.86 to 1.04 | |
| Bagchi (1988) | 1965-66 to 1973-74 | 0.99 | |
| | 1973-74 to 1984-85 | 0.62 | |
| <i>B Estimates Based on Inclusion of Tax Rate Variable in Elasticity Equation</i> | | | |
| Srivastava (1975) | 1961-62 to 1972-73 | 1.00 | Progressive rate structure is represented by an estimated initial rate and an incremental factor. |
| <i>C Estimates Based on Constant Rate-Base Method</i> | | | |
| Gulati (1962) | 1949-50 to 1958-59 | 2.70 | At the rate structure of 1958-59. Based on data corresponding to first and last years of the reference period. |
| Gupta (1975) ³ | 1951-52 to 1964-65 | 0.63 | At the rate structure of 1954-55 with exemption limit at Rs 4200 and Rs 3000 respectively. |
| Gupta and Aggarwal (1982) ⁴ | 1954-55 to 1964-65 | 0.53 | At the rate structure of 1972-73 |
| | 1965-66 to 1975-76 | 0.56 | At the rate structure of 1974-75 |
| | 1954-55 to 1964-65 | 0.63 | |
| | 1965-66 to 1975-76 | 0.58 | |
| Rao (1987) ⁵ | 1953-54 to 1974-75 | 0.91 | At the rate structure of 1961-62 |
| | | 0.92 | At the rate structure of 1974-75 |
| <i>D Estimates Based on Cross-Section Data</i> | | | |
| Rao (1987) | 1961-62 | 1.33 | |
| | 196-67 | 1.35 | |
| | 1971-72 | 1.51 | |
| | 1974-75 | 1.36 | |

Notes: 1 Budget estimates of revenue effects of discretionary changes made in different years ignore the revenue effects of some of the discretionary changes on the optimism that the effect would be compensated for by better tax compliance. In the absence of any evidence in favour of such an optimism, Bagchi and Rao have accounted for also the revenue effects of such discretionary changes and obtained three alternative sets of estimates of the revenue effects.

2 Aggarwal used three alternative sets of revenue effects. First, as per the budget estimates, second, accounts for also the revenue effects of the change made outside the budget, third, accounts for also the revenue effects ignored on the optimism of better tax compliance, but only to the extent of 50 per cent of such revenue effect.

3 Elasticity estimates by Gupta (1975) are with respect to assessed income, whereas by others are with respect to GDP at factor cost (at current prices).

4 Covers the categories of taxpayers: Individuals, Hindu undivided families, unregistered firms, and associations of other persons.

5 Covers only individuals and Hindu undivided families.

come classes. In estimating hypothetical tax revenue with the tax structure of a reference year, the former lays emphasis on imposing the distribution of income of the reference year in all the years in the reference period while the latter stresses imposing the ratios of deductions to incomes by income classes in the reference year, in each of the years in the reference period. The method based on highly disaggregative data applies legal tax structure of the reference year to the incomes of each of the taxpayers in each of the years in the reference period. It is implicitly assumed in the constant rate-base methods that the distribution of income within an income class remains unchanged over time. If this assumption is violated then these methods may give a distorted series of hypothetical tax yield that may result in a misleading estimate of elasticity.

The method based on adjustment of estimate of buoyancy was proposed by Choudhry (1979). It derives a 'divisia index' on the basis of historical data on the tax yield. This index is used to adjust buoyancy

of the tax to obtain an estimate of elasticity. This method can be said to suffer from two major limitations. First, it can underestimate the positive revenue effects and overestimate the negative revenue effects. Second, it may not give satisfactory results when the effects of the discretionary changes are of large magnitude.

III Proposed Modification in Constant Rate-Base Method

Depending on the available data, the constant rate-base method based on data grouped by income classes is applied in this study for estimating series of hypothetical tax revenue at a constant rate structure. However, the method based on grouped data, as generally applied, ignores changes, over time, in the distribution of income within the income classes. We have modified the rate-base method to account for these changes. The changes in per capita income of the taxpayers in a given income class, over time, are taken to reflect changes in the distribution of income among the taxpayers within the income class. Therefore, even the modified method would not correct for a change in the distribution of income that would not change per capita income of the taxpayers. But such a change is unlikely to have a significant impact on the tax yield. The modified rate-base method as applied in the current study is described below. This method involves the following four steps in estimating a series of hypothetical tax revenue at a given rate structure:

- (i) obtaining average tax rates and average incomes by income classes in different years;
- (ii) estimation of hypothetical average tax rates by income classes in different years at the rate structure of the reference year;
- (iii) estimation of hypothetical tax revenue by income classes in different years at

the rate structure of the reference year; and

- (iv) obtaining the time series of hypothetical tax revenue at the rate structure of the reference year.

The following notations are used in describing these steps:

- n = number of years in the reference period
- k = number of income classes
- N = number of taxpayers
- TI = taxable income
- TR = tax revenue
- ATI = average taxable income
- ATL = average tax liability
- ATR = average tax rate
- ATR^* = estimated hypothetical tax rate at the rate structure of a reference year
- TR^* = estimated hypothetical tax revenue at the rate structure of a reference year.

Scripts i ($=1, 2, 3, \dots, n$) and j ($=1, 2, 3, \dots, k$) would be used for i th year and j th income class respectively, e.g., TI_{ij} would denote taxable income of the j th income class in the i th year.

(i) Steps 1 and 2

Average tax rate and average taxable income of different income classes can be obtained for each of the years in the reference period, as follows:

$$ATR_{ij} = TR_{ij}/TI_{ij} \quad \dots(4)$$

$$ATI_{ij} = TI_{ij}/N_{ij} \quad \dots(5)$$

If, over time, distribution of taxable income within each income class remains unchanged, then the average tax rates corresponding to a reference year as given by equation (4) can be taken as the average tax rates applicable to the other years at the rate structure of the reference year. However, if distribution of taxable income within an income class does not remain unchanged, then for that income class the average tax rate at the rate structure of the reference year need be estimated by accounting for the change in distribution of taxable income within the income class. For estimating such hypothetical average tax rates, we assume that for fixed income brackets, change in the distribution of taxable income within an income class is appropriately reflected in change⁶ in the average income of the income class. So the average tax rates, at the rate structure of a reference year, applicable to an income class in different years can be estimated by accounting for the change in average taxable income of the income class.

The hypothetical average tax rates can be estimated on the basis of a relationship between the average tax rate and average taxable income at the rate structure of the reference year. For r th year as the reference year, this relationship may be estimated by fitting the following specifications of an average tax rate function:

$$ATR_{ij} = \alpha_1 + \beta_1 ATI_{ij} + \tau_1 (1/ATI_{ij}) \dots(6)$$

$$\text{Log } ATR_{ij} = \alpha_2 + \beta_2 \text{Log } ATI_{ij} + \tau_2 (1/ATI_{ij}) \quad (7)$$

TABLE 2: RANGE OF AVERAGE INCOMES AND AVERAGE TAX RATES OF INDIVIDUAL TAXPAYERS BY INCOME CLASSES (1966-67 TO 1983-84)

| Income Class (Rs Thousand) | Range of Average Taxable Income (Rs Thousand) | Range of Average Tax Rates (Per Cent) |
|----------------------------|---|---------------------------------------|
| (1) | (2) | (3) |
| 15-20 | 16.83 - 17.87 | 6.92 - 12.72 |
| 20-25 | 21.89 - 22.37 | 11.64 - 16.74 |
| 25-30 | 27.01 - 27.50 | 15.62 - 20.47 |
| 30-40 | 34.12 - 37.73 | 22.07 - 26.77 |
| 40-50 | 44.01 - 45.43 | 25.36 - 34.57 |
| 50-70 | 57.42 - 58.78 | 32.23 - 42.42 |
| 70-100 | 81.27 - 82.76 | 39.30 - 51.28 |
| 100-200 | 123.86 - 133.66 | 49.28 - 65.04 |
| 200-300 | 234.65 - 244.45 | 52.52 - 74.81 |
| 300-400 | 337.21 - 347.10 | 49.06 - 75.79 |
| 400-500 | 436.00 - 461.54 | 50.54 - 80.15 |
| Above 500 | 903.03 - 2050.96 | 63.49 - 87.64 |
| All | | 13.23 - 19.58 |

TABLE 3: ESTIMATES OF PARAMETERS OF THE EQUATION OF AVERAGE TAX RATE AT THE RATE SCHEDULE OF 1983-84

| Equation No | Dependent Variable | Constant Term | Average Taxable Income | Log of Average Taxable Income | Inverse of Average Taxable Income | R ² | Range of Deviation of Estimated Values from Actuals (Per Cent) |
|-------------|--------------------|---------------------|------------------------|-------------------------------|-----------------------------------|----------------|--|
| | (1) | (2) | (3) | (4) | (5) | (6) | (7) |
| i | Log ATR | 4.04867 (18.83) | | 0.01151 (0.32) | 35.71960 (13.30) | 0.99 | (12,13) |
| ii | Log ATR | 1.40934 (3.94) | | 0.43447 (5.78) | | 0.75 | (51,44) |
| iii | ATR | 47.94967 (21.87) | 0.01322 (4.46) | | 791.01408 (11.23) | 0.96 | (14,260) |
| iv | ATR | 27.82315 (6.00) | 0.03061 (3.30) | | | 0.48 | (-76,55) |

Notes: 1 Estimates are based on cross-section of income classes for the relevant assessment year.
2 Estimates correspond to the taxpayers with taxable income greater than Rs 15,000
3 Figures in parentheses give t-statistic.

These specifications allow the average tax rate to vary with average taxable income. These specifications are thought appropriate as the average tax rate at high income levels is expected to rise with income. It is so, because of lower increase in marginal tax rates with increase in income at high levels of income and because of ceiling on maximum marginal tax rate in general. The choice between these specifications has to depend on the parameter estimates and allied statistics.

Let us denote the estimated values of α_1 , β_1 , τ_1 , α_2 , β_2 , and τ_2 at the rate structure of the reference year by α_1^* , β_1^* , τ_1^* , α_2^* , β_2^* and τ_2^* respectively. Now, the estimates of average tax rates in each of the years at the rate structure of the reference year can be obtained by simulating these specifications as follows:

$$ATR_{ij} = \alpha_1^* + \beta_1^* AT_{ij} + \tau_1^* (1/AT_{ij}) \quad (8)$$

$$\log ATR_{ij} = \alpha_2^* + \beta_2^* \log AT_{ij} + \tau_2^* (1/AT_{ij}) \quad (9)$$

ATR_{ij} can be obtained with the empirically preferred specification of the average tax rate function.

(ii) Steps 3 and 4

Tax revenue of an income class, in different years, at the rate structure of the reference year by accounting for the change in distribution of taxable income in the income class can be obtained as:

$$TR_{ij} = TI_{ij} \cdot ATR_{ij} \quad (10)$$

Tax revenue of the taxpayers of all the income classes can be obtained as:

$$TR_i = \sum_{j=1}^k TR_{ij} \quad (11)$$

TR_i gives the series of hypothetical tax revenue at the rate structure of the reference year.

IV

Data, Limitations and Remedy

The only source of data on income class-wise distribution of the taxpayers in India is *All India Income Tax Statistics* (AIITS). The limitations of these data have been widely discussed (see, for example, Gupta and Aggarwal, 1982, Chapter II; and Bagchi and Aggarwal, 1983). These data are based on the assessments completed in a year. These data for a year can be taken to correspond to a fraction of the total number of taxpayers in that year and these relate to the incomes earned in the previous year.

The fraction of total number of taxpayers covered in AIITS has not remained unchanged over time. So the time series of hypothetical tax revenue require adjustments. The adjustment multiplier for the i th year ' M_i ' can be taken as the ratio of total number of taxpayers (N_i^*) to those covered in AIITS (N_i) in the i th year (i.e., $M_i = N_i^*/N_i$). For this purpose, the data on the total number of taxpayers in the books of the department at the end of a year are taken from the *Report of the Comptroller and Auditor General of India, Direct Taxes*

V

Reference Period, Coverage and Rate Structure

Reference period is taken from 1966-67 to 1983-84. Prior to 1966-67, the legal definition of taxable income differed significantly from that in the later years, and 1983-84 is the latest year for which comparable data are available. From 1984-85, the data published are return-based instead of assessment-based, i.e., the published data are based on the information as furnished by the taxpayers instead of information on the taxpayers after their assessments are completed. AIITS was not published for the years 1971-72 and 1973-74. Excluding these two years, our reference period covers 16 years.

The study covers the single major category of personal income tax payers—'individuals'. These account for more than 90 per cent of the number and taxable income of all the taxpayers.

Estimates of elasticity are obtained at the rate structure of the latest year in the reference period, i.e., 1983-84. During the reference period, the exemption limit for individuals has been raised from Rs 4,000 to Rs 15,000. It was Rs 15,000 in the assessment year 1983-84.

VI

Estimation of Series of Hypothetical Tax Revenue at Rate Structure of 1983-84

The estimates of series of hypothetical tax revenue at the rate structure of 1983-84 are obtained in the following two stages:

(i) Estimates of Average Taxable Income

Average taxable income of each income class is computed for different years in the reference period. In each income class, a substantial variation in average taxable income over time is observed—the variation is specifically marked in the high level income classes. The range of variation in the average taxable income, in the income classes Rs 15-20 thousand, Rs 30-40 thousand, Rs 100-200 thousand, and above Rs 500 thousand was Rs 16.83-17.83 thousand, Rs 34.12-37.13 thousand, Rs 123.86-133.66 thousand and Rs 903.03-2050.96 thousand respectively (Table 2, column 2). This suggests that the distribution of income within the income classes has not remained unchanged over time. This would have caused substantial variation over time in the average tax rate of an income class even at an unchanged rate structure. Therefore, we have estimated hypothetical tax rates for each of the income classes in different years at the rate schedule of a reference year by accounting for changes in the distribution within the income classes.

(ii) Estimates of Hypothetical Average Tax Rates and Tax Revenue

Average tax rate is obtained for each in-

period. As one would have expected, the average tax rate of each income class has shown wide variation over time (Table 2, column 3).

For estimating hypothetical average tax rates, equations 6 and 7 are estimated with and without the inverse of average income variable with the cross-section of income classes for the year 1983-84. The parameter estimates alongwith allied statistics are given in Table 3.

TABLE 4: RANGE OF ESTIMATED HYPOTHETICAL AVERAGE TAX RATES OF INDIVIDUAL TAXPAYERS AT THE RATE SCHEDULE OF 1983-84, DURING 1966-67 TO 1983-84 BY INCOME CLASSES

| Income Class (Rs Thousand) | Range (Per Cent) |
|-------------------------------|---------------------|
| 15-20 | 7.02 - 8.03 |
| 20-25 | 11.62 - 12.03 |
| 25-30 | 15.87 - 16.25 |
| 30-40 | 20.96 - 23.19 |
| 40-50 | 26.59 - 26.88 |
| 50-70 | 32.24 - 32.72 |
| 70-100 | 38.85 - 39.17 |
| 100-200 | 45.41 - 46.42 |
| 200-300 | 52.42 - 52.76 |
| 300-400 | 55.13 - 55.32 |
| 400-500 | 56.66 - 56.93 |
| Above 500 | 59.65 - 61.40 |

TABLE 5: ADJUSTMENT MULTIPLIERS OF INDIVIDUALS TO CORRECT FOR VARIED COVERAGE OF THE TAXPAYERS IN DIFFERENT YEARS

| Year | Total No of Taxpayers (Thousand) | Taxpayers Covered in AIITS (Thousand) | Adjust- ment Multipliers of Indi- viduals (2)/(3) |
|---------|---|--|--|
| (1) | (2) | (3) | (4) |
| 1966-67 | 2234 | 1586 | 1.409208 |
| 1967-68 | 2214 | 1510 | 1.466258 |
| 1968-69 | 2146 | 1753 | 1.224515 |
| 1969-70 | 2366 | 1793 | 1.319778 |
| 1971-72 | 2569 | 1967 | 1.306296 |
| 1972-73 | 2692 | 1966 | 1.369066 |
| 1974-75 | 2885 | 2119 | 1.361128 |
| 1975-76 | 2981 | 2131 | 1.399013 |
| 1976-77 | 2877 | 2139 | 1.344958 |
| 1977-78 | 3038 | 2228 | 1.363668 |
| 1978-79 | 3052 | 1667 | 1.831141 |
| 1979-80 | 3160 | 1549 | 2.040309 |
| 1980-81 | 3489 | 1237 | 2.821003 |
| 1981-82 | 3521 | 1200 | 2.934072 |
| 1982-83 | 3612 | 1055 | 3.423878 |
| 1983-84 | 3638 | 886 | 4.103614 |

Note: The decline in the number of taxpayers covered in AIITS during the period 1977-78 to 1983-84 is attributable to the departmental policy to allocate relatively lesser resources for compilation of income tax statistics.

Source: For column (2) *Report of the Comptroller and Auditor General of India* for different years, and for column (3) *All India Income Tax Statistics* for dif-

From Table 3 it would be noted that the parameter estimates of both the specifications of the tax rate function are significant at 99 per cent level of confidence. As expected, in both the specifications, the variable—inverse of average taxable income—is an important variable, as dropping it from the specifications leads to substantial reduction in their explanatory powers (column 6). So the specifications with the inverse variable are preferable to those without it. Between equations 6 and 7, the latter gives better fit in terms of explanatory power of the equations, and the range of deviation of

simulated values from the actual values of the average tax rates (columns 6 and 7). This suggests that equation 7 is preferable to equation 6. Therefore, equation (i) is used for estimating hypothetical average tax rates in different years at the rate schedule of the assessment year 1983-84. The ranges of estimates of hypothetical average tax rates by income classes, thus obtained at the rate schedule of the year 1983-84, are given in Table 4.

From Table 4 it may be noted that hypothetical average tax rate of an income class has shown a substantial variation during the

reference period. The ranges of variation in the hypothetical average tax rates for the income classes Rs 15-20 thousand, Rs 100-200 thousand, and above Rs 500 thousand are respectively 7.02-8.03 per cent, 45.41-46.42 per cent and 59.65-61.50 per cent. This suggests that failure of the earlier researchers to account for this variation in the average tax rate of an income class might have introduced an unknown distortion in their series of estimated hypothetical tax revenue at a constant rate structure and hence in their estimates of elasticity of the tax.

Hypothetical tax revenue in different income classes of the taxpayers, with taxable income exceeding Rs 15,000⁵ in each of the years in the reference period, at the rate schedule of 1983-84 is obtained by using the hypothetical average tax rates in equation 10. Hypothetical tax revenue in a year is obtained by adding the hypothetical tax revenue in different income classes. This gives a time series of hypothetical tax revenue at the rate schedule of 1983-84.

Hypothetical tax revenue as well as taxable income of different years is not comparable over time because of variation in coverage of the taxpayers in different years. These series need to be corrected. This is done by multiplying the revenue and taxable income in a year by the adjustment multiplier which is the ratio of total number of taxpayers in a year to the number of taxpayers covered in our data set. The adjustment multipliers of individuals computed for different years are presented in Table 5 (column 3). The corrected series of taxable income and of hypothetical tax revenue are given in Table 6 along with gross domestic product (GDP) at factor cost and current prices (with one-year lag). Gini index of taxable income of individuals is estimated based on the distribution of taxpayers into the same set of 14 income classes in each year in the reference period. The 14 income classes comprise 12 income classes as listed in Table 2, and the other two income classes as nil to Rs 10,000, and Rs 10,000 to Rs 15,000. Gini indices are estimated by accounting for inequality within the income classes. This has been done, following Aggarwal (1990) and Kakwani (1980, Chapter 6), on the assumption of linear density functions within the income classes.⁶ Lower and upper values of the estimates were obtained to test for goodness of fit of the linear density functions. The estimated values of Gini index were found to lie between their lower and upper values implying that the assumption of linear density functions within the income classes is not unrealistic. These values of Gini index (G) along with its lower (GL) and upper (GU) values are given in columns 5 to 7 in Table 6.

TABLE 6: ESTIMATES OF TAXABLE INCOME, HYPOTHETICAL TAX REVENUE AT THE RATE SCHEDULE OF 1983-84, NATIONAL INCOME AND GINI INDEX OF TAXABLE INCOME

| Assessment Year | Taxable Assessed Income (Rs Crore) | Hypothetical Tax Revenue at the Rate Schedule of 1983-84 (Rs Crore) | Gross Domestic Product at Factor Cost at Current Prices (Rs Crore) | Gini Index of Taxable Income | | |
|-----------------|------------------------------------|---|--|------------------------------|---------------------|------------------|
| | | | | Lower Value (GL) | Estimated Value (G) | Upper Value (GU) |

Notes: ** Estimated by Cochrane-Orcutt method that adjusts for serial correlation of first order.

* Estimated by Cochrane-Orcutt method that adjusts for serial correlation of second order.

1 Figures in parentheses give t-statistic.

2 All the elasticity estimates are significant at 99 per cent level of confidence.

VII

Estimates of Elasticity of Tax

Estimates of elasticity of the tax are obtained by estimating the following two specifications of the tax function (3) with

exclusion of tax rate variable:

$$\text{Log TR}_i^{**} = \alpha_1 + \beta_1 \text{Log GDP}_{i-1} + \tau_1 \text{Log G}_i \quad (12)$$

$$\text{Log TR}_i^{**} = \alpha_4 + \beta_4 \text{Log GDP}_{i-1} \quad (13)$$

where TR_i^{**} is corrected hypothetical tax revenue in the i th year at the rate schedule of the year 1983-84 β_3 and β_4 can be interpreted respectively as partial and total elasticities of the tax with respect to GDP

Both the equations 12 and 13 are estimated by Ordinary Least Squares method. In case of problem of serial correlation, an equation has been re-estimated by Cochrane-Orcutt iterative method that adjusts for serial correlation. All the parameter estimates of equations 12 and 13 along with allied statistics are given in Table 7. Estimates of partial and total elasticities of the tax with respect to taxable income are also obtained by re-estimating equations 12 and 13 by replacing GDP_{i-1} by taxable income of the i th year. These are also reported in Table 7.

From Table 7, it would be noted that partial elasticity of the tax with respect to in-

equality in the distribution of taxable income is significantly positive (column 4), with all the income variables used. This suggests that the decline in inequality in taxable income during the reference period would have had negative impact on the total elasticity of the tax. If the distribution of taxable income had remained unchanged during the reference period then the total elasticity of the tax with respect to GDP would have been around 1.49 instead of 1.17 (equations (i) and (ii), column 2). These findings are also supported by the estimates of elasticity with respect to taxable income. If the distribution of taxable income had remained unchanged during the reference period, then the total elasticity of the tax with respect to taxable income would have been around 1.06 instead of 0.96 (equations (iii) and (iv), column 2). This implies that the government policies directed at mitigating inequality in the distribution of income in general and in the distribution of taxable income in particular dampen growth of the tax yield. This seems to be an important ingredient for tax revenue forecasting exercises,

that has so far been ignored or its effect has not been made explicit.

VIII

Conclusions

A change in inequality in the distribution of income is found to have significant impact on growth of revenue from the personal income tax. A rise (decline) in the inequality increases (decreases) the tax yield. The decline in inequality in the distribution of taxable income during 1966-67 to 1983-84 had substantial negative impact on elasticity of the personal income tax. The effect of inequality in income distribution on the tax yield has implications for forecasting the tax yield. Therefore, this effect should be explicitly taken into account in the tax revenue forecasting exercises.

If the inequality in income distribution can be held constant, then the total elasticity of the personal income tax with respect to GDP can be taken to be around 1.49, and if it is expected to decline at a rate lower than

that in the reference period, then it would be in the range 1.17 to 1.49. Further, if the inequality is expected to decline at a rate higher than that in the reference period, then the elasticity of the tax may be well below 1.17.

Notes

[I have benefited from many discussions on the topic with R K Das, Amarendra Bagchi, Pulin B Nayak and Shyam Nath. My thanks are due to Praveen Kumar, S N Sharma and Promila Rayvanshi for adept secretarial assistance.]

- 1 The elasticity of a tax reveals how the tax yield at a constant tax structure grows in response to growth in national income or the tax base. It is defined as the ratio of proportional change in the tax yield at a constant tax structure to the proportional change in national income or the tax base.
- 2 Buoyancy of a tax is defined as the ratio of proportional change in the historical tax yield to the proportional change in national income.
- 3 There is another approach to calculating elasticity that gives, year by year, point elasticity. This method of calculating elasticity assumes equiproportionate growth in incomes of all the persons, and that the income growth does not affect their marginal tax rates. For an exposure to this method of calculating elasticity see Fries, Hutton and Lambert (1982), and Hutton and Lambert (1980).
- 4 The type of change in the distribution of taxable income within an income class that would not be affecting the average taxable income of the income class is unlikely to have any significant impact on average tax rate of the income class, at an unchanged tax structure.
- 5 Rs 15,000 was the exemption limit in the assessment year 1983-84.
- 6 Suppose there are n taxpayers that are grouped into k income classes, $(x_0 \text{ to } x_1)$, $(x_1 \text{ to } x_2)$, ..., $(x_{k-1} \text{ to } x_k)$. Let n_i and y_i denote number and income of taxpayers in the i th income class. Further, let f_i and p_i denote proportions of number of taxpayers in and up to the i th income class respectively. The formula used for computation of Gini index, based on the assumption of a separate linear density function within each income class which exactly fits the data points, is

$$G = GL + \frac{1}{\mu} \sum_{i=1}^k f_i^2 \mu_i G_i$$

where

$$GL = 1 - \sum_{i=1}^k f_i (q_i + q_{i-1})$$

$$f_i = n_i/n$$

$$\mu_i = y_i/n_i$$

$$\mu = y/n$$

$$y = \sum_{i=1}^k y_i$$

$$q_i = \frac{1}{\mu} \sum_{j=1}^i f_j \mu_j, \quad i = 1, 2, \dots, k$$

$$G_i = (2/15) (\Delta x_i / \mu_i) (9 d_i + 9 d_i^2), \quad i = 1, 2, \dots, k-1$$

$$G_k = (\mu_k - x_k) / (\mu_k + x_k)$$

$$\Delta x_i = x_i - x_{i-1}$$

$$d_i = (\mu_i - x_{i-1}) / \Delta x_i$$

GL gives an estimate of income inequality (G) based on the assumption that inequality of income within each income class is zero. The test of goodness of fit of the linear density functions within the income classes is conducted on the basis of the following inequality

$$GL < G < GL + D$$

Where D_i for the last income class is open ended class is given as

$$D = \left\{ \sum_{i=1}^k f_i^2 (\Delta x_i d_i (1 - d_i) + f_k (\mu_k - x_{k-1})) \right\}$$

The estimate of G satisfying the above inequality would mean that the fit is satisfactory. For an exposition to the above formulae see, for example, Aggarwal (1990), Gastwirth (1972), and Kakwani (1976).

HOECHST INDIA LIMITED

FORM 11 A

(See Rule 4A(1))

Form of general notice to be given to the members of the public before making an application to the Central Government under sub-section (2) of Section 22 of the Monopolies & Restrictive Trade Practices Act, 1969

NOTICE

It is hereby notified for the information of the public that HOECHST INDIA LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies & Restrictive Trade Practices Act, 1969 for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under —

1. Name and address of the applicant
Hoechst India Limited
Hoechst House, Nariman Point
193, Backbay Reclamation,
Bombay 400 021
2. Capital Structure of the applicant Organisation
Authorised capital
Rs 100,000,000 divided into 1,000,000 Equity shares of
Rs 100/- each
Issued, Subscribed and Paid-up Capital
Rs 95,769,000 divided into 957,690 Equity shares of
Rs 100/- each
3. Management Structure of the applicant Organisation
indicating the names of the directors, including
managing/wholtime directors and manager, if any
The Company is managed by the Managing Director under
the overall supervision and control of the Board of
Directors
Names of Directors
Mr Vijay Maliya (Chairman)
Dr E Baltin (Managing Director)
Mr S V Divecha
Mr C L Jain (Whole-time Director)
Dr H G Janson
Dr J Reden
Mr U Seitz
Mr H J Timmer
Mr P N Venugopalan
Mr V L Schmidt
(Alternate Director to Dr H G Janson)
Mr K K Unni (Wholtime Director)
(Alternate Director to Mr H J Timmer)
4. Indicate whether the proposal relates to the establish-
ment of a new undertaking or a new unit/division
The proposal relates to the manufacture of new Articles in
the existing manufacturing plant
5. Location of the new undertaking/unit/division
Mulund
District Greater Bombay
Maharashtra State
6. In case the proposal relates to the production, storage
supply, distribution, marketing or control of any
goods/articles indicate
i) Name of goods/articles
ii) Proposed licensed capacity
iii) Estimated annual turnover
BATRAFEN (Ciclopriox Olamine) CREAM and SOLUTION
Will be manufactured within the installed capacity available
in Mulund, Greater Bombay, Maharashtra State for
Ointments/Liquid Orals
Rs 140 crores approximately
7. In case the proposal relates to the provision of
any services, state the volume of activity in terms of
usual measures such as value, income turnover, etc
Not Applicable
8. Cost of the Project
NIL Since formulation activity will be undertaken within
the existing facilities for Ointments/Liquid Orals available in
Mulund as stated above
9. Scheme of finance indicating the amounts to be
raised from each source
Not Applicable

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Government of India, Ministry of Industry, Department of Company Affairs, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein

Depreciation Restriction

Revenue Potential and Impact on Corporate Sector

K C Sharma

This paper examines the government's decision, taken in December last year, to limit allowable depreciation to 75 per cent of the amount calculated under the Income Tax Act and attempts to assess (a) the extent of corporate tax revenue which could have accrued from this measure if all the existing leakages in the corporate tax system had been plugged, and (b) its impact on the level of gross saving of the corporate sector. It is argued that the revenue raising potential of this measure was largely frittered away in 1990-91 due to the availability of many tax offsetting provisions in the present corporate tax system and the author attempts to identify the major leakages and suggests measures to plug them. It is also suggested that this measure of disallowance of depreciation be tried again in 1991-92 after removing the identified leakages.

THE government of India had announced on December 27, 1990 that the allowable depreciation on the written down value of block of assets would be limited to 75 per cent of the amount calculated under the Income Tax Act and had estimated additional resource mobilisation of Rs 750 crore from this measure during 1990-91. The government had earlier hiked the surcharge on corporate income tax from 8 per cent to 15 per cent and had estimated accretion of Rs 400 crore from that measure. These corporate tax measures together aimed at mobilising Rs 1,150 crore were taken on top of the two main steps of abolition of investment allowance/IDBI deposit account scheme and reduction in the basic tax rates by 10 percentage points in the union budget, 1990-91, which were expected to generate additional revenue to the tune of Rs 800 crore and yield total corporate tax revenue of Rs 6,089 crore in 1990-91 under the new dispensation as against Rs 5,289 crore under the old tax structure. Inclusive of the two post-budget corporate tax measures mentioned above, the government had evidently taken steps to raise corporate tax revenue of Rs 7,239 crore in 1990-91.

Against the envisaged corporate tax collection of this order in 1990-91, the interim central budget for 1991-92 has presented only the original budget estimate of corporate tax revenue of Rs 6,089 crore for 1990-91 and the revised estimate of Rs 6,350 crore. In his budget speech, the union finance minister had attributed the additional corporate tax collection of Rs 261 crore over the budget estimate largely to the post-budget additional resource mobilisation during 1990-91. The budget papers, on the other hand, state that the revised estimate of corporate tax collection has been arrived at after taking into account the changes made through the Taxation Laws (Amendment) Act, 1991 which includes the depreciation restriction measure. Therefore, in the absence of any explicit reference in the union budget to the extent of accretion to corporate tax revenue from this measure, it is difficult to ascertain its likely contribution to the exchequer. But since the post-budget hike in surcharge on corporate income tax by seven per cent would have anyway yielded revenue to the extent of at least Rs 328 crore (total collection from 15 per cent surcharge being Rs 702 crore as per revised estimate in the interim

budget) and also because there are many tax offsetting provisions in the current corporate tax structure to have permitted depreciation restriction measure to yield the requisite additional revenue, its implication for the economy need to be carefully examined. Moreover, the latest available data on net corporate tax collection in 1990-91 has reportedly shown actual corporate tax revenue at around Rs 5,300 crore because of the higher order of refunds disbursed in 1990-91 amounting to Rs 2,032 crore relating to the accounting year 1989-90 as against Rs 1,150 crore refunded in 1989-90 pertaining to 1988-89. But for the sharp rise in refunds by Rs 882 crore in 1990-91, the corporate tax revenue would have aggregated Rs 6,182 crore.

This paper attempts to assess (a) the extent of corporate tax revenue which could have accrued from this measure specifically if all the existing leakages in the corporate tax system had been plugged, and (b) its impact on the level of gross saving of the corporate sector. Since the revenue raising potential of this measure was largely frittered away in 1990-91 due to availability of the many tax offsetting provisions inherent in the present corporate tax system, this paper also attempts to identify the major leakages and suggests measures to plug them. It also suggests that this measure of disallowance of depreciation to the extent of 25 per cent for tax computation be tried again in 1991-92 after removing the identified leakages in order to realise the full revenue potential of this measure for meeting increased revenue requirements. However, before dealing with this subject, it is essential to first deliberate as to what the restriction on allowable depreciation implies.

The paper has been divided into six sections. Section I deals with the implications of the measure of restriction on allowable depreciation for the prevailing rates of depreciation. Section II spells out the methodology used for computing the additional corporate tax revenue which could have been raised from this measure in 1990-91 if leakages had been sealed. Section III details the actual computations of additional corporate tax revenue based on the available data. Section IV sets out the impact of the diversion of resources from the corporate sector to the government by way of additional tax revenue on the gross saving

of that sector. Section V identifies the various leakages in the present corporate tax structure, which would first need to be sealed before the requisite revenue could accrue from this measure if this measure was to be extended to 1991-92 and Section VI summarises the conclusions.

I

Implication of Depreciation Allowance Restriction

Depreciation allowance is allowed to be deducted from the gains of business or profession in order to provide for replacement cost of assets which are used up in the course of carrying on of such business or profession. Depreciation allowance therefore provides a cover against the diminishing value of assets on account of their wear and tear over a certain specified period which may broadly correspond to the pre-determined life of an asset.

Ordinarily a company is allowed to charge depreciation on its fixed assets broadly by using two methods, viz, the written down value method and the straight line method which are also known as 'declining balance method' and 'sum-of-digits' or 'fixed instalment method'. The written down value method has an advantage over the straight line method in so far as it enables a company to charge more depreciation in the earlier years of the use of an asset than in the later years. Thus it provides for accelerated depreciation in the earlier stage and helps the company to recover a major portion of its investment in plant and machinery at a speedier pace and leads to greater generation of internal resource which would have otherwise gone toward tax payments.

The Income Tax Act prescribes rates of depreciation according to the written down value method to enable speedier recovery of cost of assets by the assessee with a view to promoting investment. The Companies (Amendment) Act, 1988, on the other hand lays down different rates of depreciation according to the written down value method as well as the straight line method for presentation of books of accounts. The Companies Act, 1956 already allows further flexibility to the companies to compute their profit separately under section 205 for payment of

dividend and under section 350 for payment of remuneration to the directors, manager, etc. of the company. Under section 205, the Central Government can also allow a company to pay dividend for any financial year out of the profits of the company for that year or any previous financial year without providing for depreciation. A comparative picture of the rates of depreciation which are broadly admissible under the Income Tax Act and the Companies (Amendment) Act, 1988 is presented in the annexure.

The restriction on allowable depreciation for various blocks of assets to the extent of 25 per cent in 1990-91 was applicable for rates admissible under the Income Tax Act. As a result, the rates of depreciation on the specified blocks of plant and machinery given in the annexure against three different slabs of 33.33 per cent, 50 per cent and 100 per cent stood reduced to 25 per cent, 37.5 per cent and 75 per cent respectively. These rates had become admissible with effect from the accounting year 1987-88 when these were hiked from the earlier rates which were spread over five slabs including the general rate of 15 per cent, the special rate of 20 per cent and three other rates of 30 per cent, 40 per cent and 100 per cent. The rates of depreciation on residential and factory buildings and wooden structures had been left unchanged at 5 per cent, 10 per cent and 100 per cent, respectively, since the accounting year 1983-84 but a higher rate of 20 per cent was introduced in 1987-88 for hotels and small dwelling units with plinth area of up to 80 square metres. Similarly while rates of depreciation admissible on vessels ordinarily operating on inland waters were left unchanged at 20 per cent for speed boats and 10 per cent for the other vessels, those on ocean-going ships were hiked from rates ranging from 5 to 10 per cent, to 20 per cent. Therefore the depreciation restriction measure should have reduced all the admissible rates of depreciation by one-fourth and its impact should have been spread over a wide spectrum of industries. However, it is entirely a different matter as to how much of this impact led to correspondingly higher taxable profits of the companies due to several tax offsetting provisions and tax concessions built into the present corporate tax structure. Therefore, the moot question is whether this measure in itself had led to any increase in taxable profits in 1990-91. If the revised budget estimates of corporate tax revenue are any indication, the government expectation of raising additional corporate tax revenue of Rs 750 crore from this measure had largely not materialised.

II

Methodology of Computing Additional Tax Revenue

In order to estimate the amount of additional tax revenue which could accrue to the central government from extending the restriction on admissible depreciation allowance from 1990-91 to 1991-92, it is essential in the first place to estimate the

amount of total depreciation which could have been provided by the private corporate sector and the non-departmental public sector enterprises separately in 1990-91 for computing the same for the entire corporate sector. This can be done by adopting any one of two alternative procedures.

The first method makes use of the available data on total depreciation as published by the Central Statistical Organisation (CSO) for 1987-88 and projects it for 1990-91 on the basis of annual average compound rates of growth for the private corporate sector and non-departmental public sector enterprises witnessed in the preceding three years, which coincide with the first three years of the Seventh Plan.

The second method relies on the projection of the available RBI company finances data on gross fixed assets formation and the average depreciation rate to estimate total depreciation for the private corporate sector (excluding co-operatives) for 1990-91. As regards depreciation provided by the public sector non-departmental enterprises, this has been projected on the basis of average annual compound rate of growth of depreciation provided by the non-departmental enterprises generating surplus internal resources, for which such data are available from the survey of the Bureau of Public Enterprises.

These data on total depreciation for the private corporate sector and public sector non-departmental enterprises generating surplus internal resources would have to be adjusted for estimated depreciation provision made by the loss-making companies. Even if some of these companies made profits in 1990-91, they would have been eligible to set off these profits against losses incurred in the preceding years and as such would not have contributed to the exchequer despite showing taxable profits after implementing depreciation disallowance provision in 1990-91.

Since there is no other reliable parameter to segregate the depreciation provided by profit-making companies from that of loss-making companies at the global level, the ratio of depreciation provision made by the existing profit-making companies to that of all companies covered in the RBI sample studies on company finances has been used. The ratio of depreciation provision of the existing loss-making companies to that of all companies covered in the RBI studies on company finances, which was placed at about 23 per cent in 1985-86, has been rising subsequently due to widespread industrial sickness and stood at 32 per cent in 1987-88. Assuming that this trend would have continued in the subsequent years as well, the ratio of depreciation provision of loss-making companies to all companies could have gone up to 40 per cent in 1990-91. Thus the ratio of depreciation provision as between profit-making and loss-making companies can be taken at 60:40 for 1990-91. This ratio is considered reasonable on other grounds also because each year a substantial portion of the depreciation on on-going new investments in plant and machinery made during the preceding two years or so

would have to be largely excluded by the companies from their depreciation claims as these new investments generally take time to fructify and yield profits to enable the companies to set off their tax liability by filing eligible claims on depreciation. In the absence of any other firm data, the proportion of depreciation eligible for working out tax liability at 60 per cent of the total estimated depreciation seems reasonable.

While these ratios would suffice for obtaining the total depreciation which could have become eligible for computing depreciation disallowance and the consequent additional tax liability in respect of companies in the private corporate sector, similar ratios for the public sector corporate enterprises would have to be worked out in proportion to the depreciation allowance which could have been provided by the profit-making and loss-making companies in that sector in 1990-91. The available data on depreciation provision in respect of non-departmental enterprises in the public sector reveal that the share of depreciation provided by the enterprises generating surplus internal resources to total depreciation provided by all the non-departmental enterprises is 50.4 per cent for the first three years of the Seventh Plan. In the absence of any other reliable data to bifurcate total depreciation of public sector enterprises as between profit-making and loss-making companies therein, the share of depreciation provided by the enterprises generating surplus internal resources to total depreciation provided by the non-departmental enterprises could well represent the respective shares of profit-making and loss-making enterprises at 50:50 for 1987-88. This ratio was expected to come down in 1990-91 as there has been an increase in the losses of loss-making units since 1987-88. Moreover, government investment in public enterprises is generally having longer gestation periods than in the private corporate sector due to the nature of such investment. Therefore, generation of surpluses by the government's recent investments would involve longer time-lags. In the circumstances, the ratio between depreciation provision of profit-making non-departmental enterprises can be placed at 45:55 for 1990-91.

TABLE I: TOTAL DEPRECIATION AS PROVIDED IN BOOKS OF ACCOUNTS
(Rs crore)

| Year | Total Depreciation | |
|----------|--------------------------|------------------------------|
| | Private Corporate Sector | Non-Departmental Enterprises |
| 1984-85 | 3405 | 4307 |
| 1985-86 | 4057 | 4540 |
| 1986-87 | 4478 | 5256 |
| 1987-88 | 5242 | 6410 |
| 1988-89* | 6053 | 7320 |
| 1989-90* | 6989 | 8360 |
| 1990-91* | 7700** | 7200** |

Notes: * Estimated.

** Rounded off to the nearest hundred.

Source: Central Statistical Organisation for data up to 1987-88

Total depreciation projected for the private corporate sector and the non-departmental public sector enterprises has to be segregated for profit-making companies by applying the above given ratios to derive the eligible depreciation which could have qualified for yielding additional tax benefit under the depreciation restriction measure. Detailed computations using the two methods are given in the following section.

III

Estimates of Possible Additional Tax Revenue

(A) ADDITIONAL REVENUE AS PER CSO DATA

The CSO data on total depreciation provided by the companies in their books of accounts in the private corporate sector as well as by non-departmental enterprises in the public sector up to 1987-88 and estimates for the subsequent three years are presented in Table 1.

Total depreciation registered an annual average compound rate of growth of 15.5 per cent in the private corporate sector and 14.2 per cent in non-departmental enterprises during the first three years of the Seventh Plan. Assuming that these growth rates would have been maintained in the next two years of the Seventh Plan, total depreciation would have stood at Rs 6,989 crore for the private corporate sector and Rs 8,360 crore for the non-departmental enterprises in 1989-90 as compared to the level of Rs 5,242 crore and Rs 6,410 crore, respectively, in 1987-88. The Gulf crisis which led to the acute balance of payments situation had a

dampening effect on imports of capital goods. This together with difficult domestic situation and extra-budgetary doses of taxation would have adversely affected the tempo of new investment in the second half of 1990-91. Therefore, the gross fixed assets formation and the resultant rate of growth of depreciation would have decelerated. In fact the deceleration in industrial production and in the incremental bank credit was already in evidence since the first quarter of 1990-91 over that in 1989-90, which may be expected to be reflected in lower rate of growth of new investment. This would have, in turn, reduced the rate of growth of depreciation which may be placed at 10 per cent for 1990-91. Similarly total depreciation that could have been provided by the non-departmental enterprises may also not exceed 10 per cent in 1990-91 due to reports of subdued performance of the public sector units, with the infrastructure sector suffering a severe setback in the second and third quarters of 1990-91 and a general slow down in the public sector investment. The results of public sector enterprises for the first half of 1990-91 have already shown increased losses of loss-making units.

At the above given rates of growth of depreciation, the total depreciation provided by all the companies in the private corporate sector would work out to about Rs 7,700 crore and that by the non-departmental public sector enterprises to about Rs 9,200 crore in 1990-91. Of this, depreciation provided by profit-making companies in the private corporate sector at 60 per cent and that by profit-making non-departmental enterprises at 45 per cent as suggested earlier in the section on

methodology, would yield eligible depreciation of Rs 4,620 crore for the private corporate sector and Rs 4,140 crore for the non-departmental enterprises, which would form the basis for computing exempted and taxable portions of depreciation.

The taxable portion of eligible depreciation at 25 per cent depreciation restriction can thus be estimated at around Rs 1,155 crore for the private corporate sector and Rs 1,035 crore for the non-departmental enterprises, as shown in Table 2. This could have yielded additional corporate tax revenue of Rs 531 crore from the private corporate sector and Rs 476 crore from the non-departmental public sector enterprises, together accounting for Rs 1,007 crore, composed of Rs 876 crore at the basic tax rate of 40 per cent and Rs 131 crore at 15 per cent surcharge thereon, of which Rs 61 crore could have accrued from hike in surcharge by 7 per cent.

Thus whichever of the two methods is applied for working out the feasible additional tax revenue owing to restriction on depreciation allowance by 25 per cent, collection could have ranged from about Rs 1,000 crore to Rs 1,100 crore, inclusive of surcharge of Rs 130-140 crore. Even excluding surcharge, additional tax revenue could have ranged from Rs 870 crore to Rs 960 crore which is also higher than Rs 750 crore estimated by the government. But since there are several tax offsetting provisions in the corporate tax structure, revenue of this order would not have been realised.

(B) ADDITIONAL REVENUE AS PER RBI AND BPE DATA

Estimates of anticipated additional corporate tax revenue resulting from the measure of depreciation disallowance have been presented in Table 5 on the basis of data obtained from RBI sample studies in respect of public, private and financial and investment companies. Total depreciation for 1987-88 for the sample companies has been blown up using the population paid-up capital to work out depreciation for the private corporate sector as a whole.

Depreciation to be provided by the private corporate sector in 1990-91 has been computed by moving forward the level of depreciation for 1987-88 to 1990-91. For this purpose, the level of gross fixed assets has

TABLE 2: FEASIBLE ADDITIONAL TAX REVENUE IN 1990-91 BASED ON ESTIMATES OF CSO DATA (Rs crore)

| Sector | Eligible Depreci- ation | Portion of Eligible Depreciation | | Additional Tax Revenue | | | Total (col 5 + col 8) | |
|---------------------------------|-------------------------------|-------------------------------------|-----------------------------|--------------------------------------|---------------|---------------|-----------------------------|-------|

(Rs crore)

| Year | Public Limited Companies | | | Private Limited Companies | | | Financial and Investment Companies | | |
|---------|--------------------------|--------------|------|---------------------------|--------------|------|------------------------------------|--------------|------|
| | Gross Fixed Assets | Depreciation | Rate | Gross Fixed Assets | Depreciation | Rate | Gross Fixed Assets | Depreciation | Rate |
| | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| 1984-85 | 37398 | 2362 | 6.3 | 12330 | 943 | 7.7 | 316 | 33 | 10.5 |
| 1985-86 | 45294 | 2917 | 6.4 | 13938 | 1018 | 7.3 | 407 | 48 | 11.8 |
| 1986-87 | 54622 | 3231 | 5.9 | 16092 | 1089 | 6.8 | 879 | 78 | 8.9 |
| 1987-88 | 61695 | 4148 | 6.7 | 18400 | 1650 | 9.0 | 1282 | 125 | 9.8 |
| 1988-89 | 69715 | 4671 | 6.7 | 20424 | 1838 | 9.0 | 1603 | 157 | 9.8 |
| 1989-90 | 78778 | 5278 | 6.7 | 22671 | 2040 | 9.0 | 2004 | 196 | 9.8 |
| 1990-91 | 86656 | 5806 | 6.7 | 24938 | 2244 | 9.0 | 2204 | 216 | 9.8 |

Notes: 1 Data are estimated at the global paid-up capital on the basis of RBI company finances studies for the period 1984-85 to 1987-88 and projected at the specified rates for the subsequent years.

2 Depreciation rate is derived by taking depreciation provision as a percentage of gross fixed assets.

been worked out in the first instance by taking average absolute growth in gross fixed assets witnessed during the first three years of the Seventh Plan at 13 per cent for public limited companies, 11 per cent for private limited companies and 25 per cent for financial and investment companies for 1988-89 and 1989-90 and estimated growth rate of 10 per cent for 1990-91 for the aforementioned reasons. Total depreciation for each year has been derived at the observed depreciation rates of 6.7 per cent for public limited companies, 9 per cent for private limited companies and 9.8 per cent for financial and investment companies in 1987-88. Depreciation rates for 1987-88 alone have been taken for the necessary computation, as the admissible rates of depreciation on various blocks of assets were hiked under the Income Tax Act with effect from the accounting year 1987-88. Total depreciation for the entire corporate sector worked out in the manner described above would have amounted to Rs 3,806 crore in respect of public limited companies, Rs 2,244 crore for private limited companies and Rs 216 crore for financial and investment companies in 1990-91 as may be seen from Table 3.

As 60 per cent of the total depreciation would represent the share of profit-making companies, Rs 3,484 crore in respect of public limited companies, Rs 1,346 crore in respect of private limited companies and Rs 130 crore in respect of financial and investment companies could have come in the purview of eligible depreciation for computing taxable portion thereof. As 75 per cent of the depreciation was entitled for tax exemption and only 25 per cent was taxable, Rs 871 crore in respect of public limited companies, Rs 336 crore in respect of private limited companies, and Rs 33 crore in respect of financial and investment companies [The basic rate of corporation tax is 40 per cent for widely held companies, 45 per cent for closely held industrial companies and 50 per cent for trading and investment companies. The surcharge on corporation tax is uniformly fixed at 15 per cent for all these companies.] could have fallen in the tax net and yielded additional tax revenue of Rs 401 crore, Rs 174 crore and

Rs 19 crore, respectively. The total additional tax revenue from the private corporate sector possibly on account of coming in of Rs 1,240 crore of depreciation in the tax net could have thus amounted to Rs 594 crore, comprising Rs 36 crore from the hike in surcharge from 8 per cent to 15 per cent.

On the other hand, total depreciation in respect of non-departmental public sector enterprises generating surplus internal resources may be placed at Rs 4,993 crore in 1990-91 at the growth rate of 14 per cent for 1989-90 as observed from 1985-86 to 1988-89 and at the growth rate of 10 per cent in 1990-91. These estimates are presented in Table 4.

Of the total depreciation of the non-departmental enterprises generating surplus internal resources, the eligible depreciation falling within the purview of the measure announced by the government could have amounted to Rs 4,463 crore on the basis of Rs 3,227 crore provided in 1987-88 and Rs 1,236 crore for the subsequent period at 70 per cent of the incremental depreciation of Rs 1,766 crore provided from 1988-89 to 1990-91. Of the eligible depreciation, Rs 3,347 crore (75 per cent) would have belonged to the exempted category and Rs 1,116 crore (25 per cent) could have been taxable. At the given corporate tax incidence of 46 per cent, additional tax revenue from non-departmental enterprises could have amounted to Rs 513 crore, including Rs 31 crore from hike in surcharge by 7 per cent.

In short, the additional tax revenue computed on the basis of RBI and BPE data could have been of the order of Rs 1,107 crore, including Rs 67 crore arising from the hike in surcharge from 8 per cent to 15 per cent as shown in Table 5.

IV

Impact on Gross Saving

Gross saving of the corporate sector needs to be estimated first before assessing the impact thereon of the possible tax collection estimated earlier. For this purpose, gross saving of the private corporate sector and non-departmental public sector enterprises is required to be estimated distinct from each other not only to assess the impact separately but also because of conceptual differences between the methods applicable for working out gross saving of the two sectors. These are discussed below.

Gross saving of the private corporate sector is measured as a sum of total depreciation and net saving. Net saving itself is derived by deducting the non-operating surplus of the companies from their retained profits. Retained profits represent the residual amount available for ploughing back into business after payment of tax and dividends from profits before tax which constitute both operating profits from normal business activity of a company and non-operating surplus/deficit emanating from its other activities and write-back of certain items pertaining to the previous year/s. These other activities may be classified as of capital nature and revenue nature. Non-operating

surplus may arise on capital account from profits on sale of fixed assets and profits on sale of investments. Similarly non-operating surplus may also arise on revenue account from write-back of excess provisions of tax, dividends, etc. made in the earlier years, insurance claims received, reverse flow of other claims such as excess excise duties paid, set-off against sales tax, etc. write-back of income/expenditure relating to the previous year and other unclaimed balances. However, due to the nature of origin of various items of non-operating surplus/deficit, all the items do not merit to be included in the saving/disa-saving of a company. There is a general consensus that only some items of a revenue nature such as excess provisions of tax, dividends, etc. written back during the current year can be legitimately taken into account for calculating the saving of a company. It has been observed that such excess provisions written back have generally constituted around one-fourth of the total non-operating surplus of the companies and may be considered for inclusion in the computation of gross saving. It may, however, not change the overall saving scenario to any significant extent or alter the results perceptibly at the macro level. Therefore, the concept of net saving as used for the private corporate sector is that which has so far been widely accepted and generally used.

Retained profits and non-operating surplus of the private corporate sector can be derived on the basis of the observed pattern of their behaviour and structural relationship between major items such as sales, profits before tax, tax provision, profits after tax and dividends as thrown up by the RBI company finances studies. To begin with, sales have been moved forward by projecting the recent growth rate in sales. Profits before tax are in turn obtained as an observed percentage of sales. Retained profits in 1990-91 have been derived by providing for the normally observed percentage of tax provision to estimated profits before tax and similarly observed percentage of dividends to profits after tax. Non-operating surplus is deduced at the ordinarily observed percentage of retained profits in the last couple of years or so. Since no consistent trend is discernible ultimately in the non-operating surplus as well as retained profits of the companies over a period of say five or 10 years, net saving of the private corporate sector as published by the Central Statistical Organisation registers vast fluctuations, as may be seen from Table 6. Therefore, a structural relationship between a number of inter-related items has to be perceived over a shorter time-frame in order to obtain the results.

Net saving of the private corporate sector has been accordingly taken at Rs 776 crore in 1988-89 which represents the annual average of net saving achieved in the preceding three years from 1986-87 to 1987-88. On the basis of 18.7 per cent average annual compound rate of growth in net saving observed in the latest RBI study on 622 large public limited companies, each

Source: Survey of Public Enterprises, 1988-89

having paid-up capital of Rs 1 crore and above and covering the period 1986-87 to 1988-89, net saving has been projected for the next two years and estimated at about Rs 1,100 crore in 1990-91. Even if the alternative method of estimating separately the retained profits and non-operating surplus of the private corporate sector is to be followed on the basis of available company finances data, retained profits can be placed at about Rs 2,000 crore and non-operating surplus at about Rs 900 crore in 1990-91 on the basis of observed structural relationships between major economic variables of the companies as explained above. Since the methodology adopted for computing net saving of the private corporate sector so far takes retained profits net of non-operating surplus, net saving would again be placed at Rs 1,100 crore. Thus the same results are obtained by both the methods whether by projecting the CSO data on net saving or the major economic variables based on RBI company finances data.

Gross saving of the private corporate sector can thus be estimated to range from Rs 8,800 crore to Rs 9,366 crore in 1990-91, comprising Rs 7,700 crore to Rs 8,266 crore towards total depreciation as estimated earlier and Rs 1,100 crore towards net saving. Gross saving of this order of the private corporate sector as against additional tax revenue which could have accrued on account of the depreciation disallowance, ranging from Rs 511 crore to Rs 594 crore estimated above, could have reduced gross saving of the private corporate sector by around 6 per cent.

As regards the gross saving of the non-departmental public sector enterprises it is measured as a sum of total depreciation, retained profits and deferred revenue expenditure (DRE) written off during the year. Since no data are reported by the non-departmental enterprises with regard to their non-operating surplus, no adjustments are made to that effect. However, deferred revenue expenditure written off during the year by the non-departmental enterprises is included in their gross saving as it represents certain payments made or payable which are amortised annually over a specified period such as technical assistance fees under foreign collaboration agreements, one-time installation charges for computers and other equipment, liability for debenture redemption premium set up at the time of allotment, retirement benefits for employees, etc. While total depreciation of the non-departmental public sector enterprises in 1990-91 has been taken on the basis of the earlier estimates presented in Table 1, estimates of retained profits and deferred revenue expenditure are based on similar data published by the Bureau of Public Enterprises in their annual surveys on the performance of public sector enterprises operating during the year.

Gross saving of the non-departmental public sector enterprises is estimated at Rs 12,680 crore in 1990-91, comprising total depreciation of about Rs 9,200 crore, retained profits of Rs 2,700 crore based on current trends and Rs 780 crore towards deferred

revenue expenditure written off during the year. Retained profits of non-departmental public sector enterprises have been reported at about Rs 3,450 crore for 1989-90. However, retained profits may be estimated at around Rs 2,700 crore in 1990-91 due to the reported increase in the losses of loss-making units during the first half of 1990-91 by Rs 622 crore and the likely subdued performance of the profit-making units during the next six months of 1990-91 due to deterioration in the overall economic environment and the reported decline in the performance of infrastructure industries in the public sector. Therefore, gross saving of the non-departmental public sector enterprises aggregating Rs 12,680 crore could have gone down by about 3.8 per cent to 4 per cent if additional tax revenue ranging from Rs 476 crore to Rs 513 crore from the non-departmental public sector enterprises on account of depreciation disallowance had been realised in 1990-91.

On the whole, gross saving of the corporate sector could have shown only a small

decline ranging from 4.6 per cent to 5 per cent on account of depreciation restriction if the possible tax collection of Rs 1,007 crore to Rs 1,107 crore from the private corporate sector and the non-departmental public sector enterprises taken together had actually materialised by the effective plugging of existing leakages in the corporate tax system, as against the estimated gross saving of about Rs 21,480 crore to Rs 22,046 crore in 1990-91. The corporate sector could have had made up the actual gap, if any, arising in their resources on account of depreciation restriction by either mobilising greater internal resources by improving productivity and reducing dividends or by raising external resources to a larger extent by greater resort to market funds or by employing varying combinations thereof and thus maintained the expected level of investment in 1990-91. But since the corporate tax collection shown in the interim budget for 1990-91 has hardly presented any evidence of revenue raising impact of this measure while at the same time several tax reduction

a As provided in the books of accounts. It would differ from the depreciation provision which may be worked out by the alternative method of estimated value of fixed capital stock and the expected age of various types of assets.

b Net saving represents retained profits minus non-operating surplus.

c Deferred Revenue Expenditure.

d Estimated.

Notes: 1 Net saving is subject to substantial revisions if derived by a change in methodology. 2 Retained profits and deferred revenue expenditure pertain to operating non-departmental enterprises and are based on surveys of public enterprises published by the Bureau of Public Enterprises.

3 The data on depreciation and net saving are those published by the Central Statistical Organisation.

procedures are available in the current corporate tax system to have neutralised the tax collecting potential of this measure it could have had hardly made any dent on the corporate investment in 1990-91.

V

Leakages from Feasible Additional Revenue

In view of the fact that the government could not realise the anticipated additional revenue from the measure of depreciation restriction in 1990-91 on the one hand and the need to reduce the burgeoning deficit on revenue account, *inter alia*, by raising the requisite revenue from corporate income tax commensurate with its potential on the other, it is desirable to first identify the existing leakages in the corporate tax system and plug them and thereafter extend this measure to the current financial year in the full-scale central budget for 1991-92. The exercise of checks would enable the government to mobilise that additional revenue in 1991-92 which it could not realise in 1990-91 from this measure. It may be emphasised that accretion of additional corporate tax revenue of the order envisaged in 1990-91 is quite feasible in 1991-92 provided the companies are not allowed to considerably reduce or nullify their additional tax liability arising from this measure by adopting escape routes presently available to them.

This can be done by bridging the following gaps in the corporate tax system.

Firstly, whenever companies are not in a position to claim depreciation allowance in particular assessment year/s due to losses or insufficiency of profits, the unabsorbed depreciation is allowed to be added to the claims made for the subsequent years. Therefore, even those companies which were hitherto making marginal profits or losses would have substantial unabsorbed depreciation allowance relating to the previous years to be set off against additional taxable profits during the current year which might be computed by them as a result of the proposed restriction on the allowable depreciation.

Secondly, there are numerous tax concessions which the companies normally try to avail of in order to minimise their tax liability. As such, there are a number of prosperous zero tax companies and high profit making but low tax paying companies which would have escaped the tax net in 1990-91, as in the past, due to the scrapping of Section 115J of the Income Tax Act in the central budget for 1990-91 which required the companies to pay tax on at least 30 per cent of their book profits. Unless this provision is reintroduced, multiple tax concessions would again enable many good companies to neutralise the impact of the restriction on depreciation allowance on their tax liability if this measure is adopted for 1991-92.

Thirdly, unabsorbed investment allowance of the preceding years up to 1989-90 would have been carried forward to 1990-91 and a large portion thereof would again spill further into 1991-92 which might also be availed of suitably by the companies to negate

their additional tax liability arising from depreciation allowance restriction unless set-off of taxable portion of depreciation is disallowed against various tax concessions, including unabsorbed investment allowance.

Fourthly, a high degree of flexibility is allowed to the companies for writing off depreciation in their books of accounts according to the straight line method as well as written down value method at the rates prescribed under the Companies (Amendment) Act, 1988 and for write-back of depreciation provided by them in the earlier years, as against the amount computed by them under the Income Tax Act according to written down value method with yet another set of depreciation rates for working out their tax liability. Besides serving the purpose of window-dressing for many a company and confusing even the knowledgeable observer, this flexibility allowed to the companies to use one written down value method under the Income Tax Act at one set of rates of depreciation for computing their income tax liability and another written down value method under the Companies (Amendment) Act at different rates of depreciation for presentation of their annual accounts, could be used ingeniously by the companies to reduce their overall tax liability.

Since the amount of unabsorbed depreciation, extent of tax concessions and unabsorbed investment allowance would differ from company to company, as also their profitability which would ultimately determine their ability to resort to these tax reducing provisions to the desired extent, it is not possible to predict as to which of these measures, either singly or in combination with one another, may be adopted by the individual companies to reduce their tax liability to the minimum. Moreover, not only no firm data on unabsorbed depreciation allowance, unabsorbed tax concessions and unabsorbed investment allowance are available, but also these data, even if surmised, cannot be straightaway clubbed together to derive the admissible tax deductions on account of the carry forward of these items from the preceding years to 1991-92. The extent of leakages accordingly could not be estimated with any precision although it would be necessary to take relevant steps in the full central budget to plug them effectively with a view to augmenting additional resource mobilisation effort during the current financial year.

VI

Conclusions

The quantum of additional corporate tax revenue estimated in the range of Rs 1,007 crore to Rs 1,107 crore, computed by using two different sets of data at the given premises, represents the maximum additional corporate tax revenue that could accrue to the government in 1991-92 by extending to the current year the restriction on depreciation allowable on written down value of assets to 75 per cent of the depreciation normally allowed under the Income Tax

Act, as announced earlier for 1990-91. Interestingly, both the methods of computation have given estimates very close to each other. But since there are a number of built-in leakages in the corporate tax system as it prevails today, the final outcome would depend on the extent to which these leakages are effectively plugged. Presumably, it is for this reason that the government had made a somewhat cautious calculation of raising additional revenue of only Rs 750 crore by this measure in 1990-91 but failed to realise even that target on account of the absence of necessary checks on the loopholes discussed above.

The government, however, could introduce this measure again in 1991-92 with the necessary checks and balances in the corporate tax system such as reintroduction of the earlier provision of minimum tax on 30 per cent of the book profits of the companies, abolished in the 1990-91 central budget, to stop the phenomenon of zero-tax companies, either by placement of moratorium on tax concession arising from unabsorbed investment allowance for a couple of years or phasing tax concession available on it over a period of four to five years, and disallowing set-off of 25 per cent depreciation disallowance by either unabsorbed depreciation or unabsorbed tax concessions. This would enable the government to raise revenue as originally envisaged from this measure.

The depreciation restriction measure in effect means that depreciation rates applicable, *inter alia*, for various types of plant and machinery allowed under the Income Tax Act, which were hiked substantially from five slabs of 15 per cent, 20 per cent, 30 per cent, 40 per cent and 100 per cent up to the accounting year 1986-87 to only three slabs of 33.33 per cent, 50 per cent and 100 per cent with effect from the accounting year 1987-88 and onwards, would stand moderated to 25 per cent, 37.5 per cent and 75 per cent, respectively. Similar reductions would occur in rates of depreciation admissible on buildings ranging from 5 to 20 per cent, on wooden structures at 100 per cent, on furniture and fittings at 10 to 15 per cent and on ships at 10 to 20 per cent. However, consequent on abolition of investment allowance/IDBI Investment Deposit Account Scheme in 1990-91, together with a corresponding reduction in the corporation tax rates, it is desirable to retain liberal depreciation rates under the Income Tax Act to encourage private investment. Incidentally, steps need to be taken to ensure better tax compliance by the companies at the substantially reduced rates of corporate income tax enunciated in the 1990-91 central budget. The impact of the depreciation restriction measure on the gross saving of the corporate sector would be rather small, at best 4 to 5 per cent, and may not adversely affect private investment if adopted as a one-time measure for 1991-92 only.

| (ii) Other vessels | 10 | 10 | 3.34 |

WDVM = written down value method; SLM = straight line method.

Notes: 1 Buildings include roads, bridges, culverts, wells and tubewells.

2 The above list of blocks of assets is indicative and not complete as the list of items classified against different rates of depreciation under Income Tax Act and the Companies Act is not uniformly available on comparable lines. The list is broadly comparable.

3 The above rates of depreciation under the Income Tax Act came into effect from the accounting year 1987-88 and have remained unchanged since then. Similarly the above rates of depreciation under the Companies Act are those given in Schedule XIV of the Companies (Amendment) Act, 1988.

4 With the introduction of a uniform accounting year with effect from the financial year ended March 1989, many companies had to either extend or shorten their accounting year 1988-89 in compliance with this provision of the Income Tax Act inserted under the Direct Tax Laws (Amendment) Act, 1987. While full normal depreciation is admissible under the Income Tax Act even if an asset is in use for a few days during the previous year, proportionately increased depreciation was admissible for the transitional year 1988-89 wherever the accounting year consisted of 13 months or more.

5 Where, during any financial year, any addition is made to any asset or any asset is sold, discarded, demolished or destroyed, the depreciation on such assets is to be calculated on a pro rata basis from the date of such addition or up to the date on which the asset is sold, discarded, demolished or destroyed, in terms of the provisions of the Companies Act.

6 Extra shift allowance was abolished with effect from the accounting year 1987-88 under the Income Tax Act following steep hike in the rates of depreciation allowable from that year under this Act. This system, however, continues to prevail under the Companies Act.

Communists and Democracy in the Philippines

Olle Törnquist

In 1986, the 'national democratic movement' which constituted the main force of the revolutionary Left in Philippines calling for a boycott of the historic elections ordered by Marcos ran into a blind alley. Other cause oriented groups rallied behind Cory Aquino and in February, Marcos had to flee the country unable to face the upsurge of people's protests. The 'national democratic movement' seemed almost irrelevant and it had soon to admit that its boycott decision had been at least a 'major tactical blunder'.

While it is important to inquire why the boycott decision was taken and why the Left lost its initiative, this article explores why the radical Left failed to carry out materialist analyses towards a more fruitful and convincing understanding of political transformation in general, and in this case the growing importance of struggle for political democracy in particular within the framework of their basic theses.

[This paper has been published in two parts. The first part appeared last week.]

IV

Rethinking?

CAME then the snap-elections and the 'EDSA revolution'. As we have seen, democratic means and demands had not been especially relevant within the radical Left. Those who suggested at least alternative tactics were either imprisoned or severely weakened. The promising attempt to establish 'Bayan' as a broad coalition of popular oppositional forces had failed.

The radical Left could do little but watch how more or less bourgeois forces, and even the Church (both of which in theory were bound to fail in any progressive undertaking), managed to guide and manipulate widespread and explosive interests in democratic rights and rule (which in Left-theory no classes were primarily interested in anyway) and got rid of Marcos, in the process using all means at their disposal (except armed struggle).

But how did the radicals read what they saw? Did they develop previous analyses further, and did their views on democracy change?

'DEMOCRATIC SPACE' OR BUSINESS AS USUAL?

Previous dissidents within the radical Left, including the 'popular democrats' and an alliance of socialists called BASIG,⁷¹ who had opposed the boycott and acted in favour of critical participation in the elections, felt vindicated. In their view, the 'EDSA revolution' had overthrown much of Marcos authoritarianism and created a 'democratic space' which had to be defended and used as long as possible.⁷² Meanwhile the armed struggle should be terminated, while the capacity to rapidly resume it could be kept intact. The new government was lacking a clear-cut social basis. Many forces were now competing for best possible positions. The radical Left should offer critical support to progressive factions within, and aspects of, the new administration, and try to make use of it. Conservative forces which had defected the Marcos regime for opportunistic reasons had to be obstructed. Radical people should try to work within the administration and

also approach progressive young officers. A lot of interest organisations among various sections of the population, cause-oriented groups, community organisations, etc, could now be even more active. There were, for instance, also unilateral actions among peasants and tenants who tried themselves to enforce agrarian reforms.⁷³ The popular initiatives should not primarily be brought under the umbrella of, for instance, the 'national democrats', but instead be supported and radicalised. The 'people power' which was expressed at EDSA could thereby be institutionalised and serve as a more firm and radical base for a more progressive coalition government.

These and similar arguments in favour of urgent democratic action to develop a basis for extended democratic rights and rule were faced with suspicion, and a general incapacity among the leading mainstream 'national democrats' to take any firm decisions. A large-scale debate on aims and means had emanated out of the devastating boycott decision.⁷⁴

This was one of the reasons why the full capacity of the radical Left to make use of the new and wider room for manoeuvre and to influence the new regime could not be utilised. Four years later, Sison, among others, admitted that a lot of opportunities "to work with Cory but also with the lower levels of RAM" were lost.⁷⁵ "She still did not have much organisational following in 1986 and we could have offered some in exchange for certain gains... For instance, we could have helped her against Enrile. Dante had the best of contacts and could have bridged me. But the boycott debate took so long time..."⁷⁶

Another reason why the radical Left mainly remained a spectator even after EDSA was the very conclusions which the mainstream 'national democrats' slowly arrived at.

The general secretary Salas resigned and the boycott-decision was, after some months, recognised as a 'tactical blunder'. But not even the two almost disobedient issues which could be published by *Praktika*, a theoretical journal of the National Urban Commission of the Communist Party, included much more than extrapolations from previous arguments and debates. The 'insurrec-

tionists', as we know, claimed that the snap-elections and EDSA had been lost opportunities. But since the revolutionary situation soon dwindled they had little to offer for the time being. And while certain arguments in other articles were rather close to those advanced by the 'popular democrats', there were, as in 1978, mostly references to Lenin's, Stalin's and Dimitrov's more cautious theses about the need to use all possible means for tactical purposes, especially when no revolutionary situation exists.⁷⁷

According to the orthodox 'national democrats', on the other hand, nothing serious could actually have happened in February 1986. The whole affair was simply a quarrel within the elite, where some factions had become fed-up with Marcos' way of governing the country, the deep economic crisis and the risk that the 'national democrats' would take over. (Some even maintained that Washington had masterminded the whole affair.⁷⁸) No basic socio-economic changes had taken place. The old ruling classes were still in place. The new government did not signal any qualitative change.⁷⁹

Meanwhile, however, many mainstream leaders kept a comparatively low profile and 'gave Aquino a chance'. For instance, negotiations between the National Democratic Front and the new government had started in August, and a ceasefire was agreed upon in November.

There were special difficulties related to these negotiations, including among other things, that those in actual command of the contending armed forces did not take part, and that it was hard for the 'national democratic' representatives to base themselves on a firm political line which was still under review.⁸⁰

But the main and general problem was rather that the new government never "got a chance". If the 'national democratic' leaders believed in their own argument that no real changes had taken place in February 1986, the new government would not be able to change much if anything. So why then "give Aquino a chance" if she could not take it?

One answer could have been that the 'na-

tional democratic' leaders were really serious in both giving Aquino and some of her associates 'a chance' as individual leaders and trusted the 'national democratic' thesis that no real socio-economic changes had taken place. But this implied that there was a need to mobilise and trade alternative "critical" support for Aquino so that she would get a real option to challenge the dominating classes. And such support was not offered by the mainstream 'national democrats', only by much less powerful Left-dissidents.

A more plausible answer is therefore that it was not Aquino who should get a chance but rather the vacillating 'national democratic' sympathisers and many of Aquino's followers who must be able to discover that the new government could not change anything. This tactic was thus almost the same as in late 1985, when the leaders who did not give the struggle for fair elections a chance but instead advocated boycott claimed that the masses would follow them as soon as people realised that more radical methods were necessary.

Consequently, the progressive forces within Aquino's administration could not rely on alternative social forces in their attempts to countervail demands from within the armed forces, landowners, national and international private business and other. But despite the fact that the rightward drift of Aquino's administration was to a certain extent a self-fulfilling prophecy of the mainstream 'national democrats', these claimed to be vindicated and began to speak up with self-confidence again. Sison, for example, stated that "the replacement of Marcos by Aquino has not rooted out the fundamental causes of fascist dictatorship, has not solved the deepgoing crisis of the semi-colonial and semi-feudal system and has kept the ground fertile for social unrest and armed revolution..." (The new government) represents the same class interests (as Marcos)—those of the comprador big bourgeoisie and the landlord class...⁸¹

That this thesis was totally inconsistent with accusations against the Aquino government for not doing anything progressive did not mean much, besides in private conversations.⁸² The most brutal dispersal of a peasant rally in central Manila in the end of January 1987, which left eighteen people killed, was instead followed by the suspension of the peace-talks on the part of the 'national democrats', after which the doors remained closed.⁸³

ANOTHER ELECTION DEBACLE

Voices of dissent continued, however, to appear among the 'national democrats'. Just a few days before the Mendiola massacre and the break down of the negotiations, continued peace-talks and broad unity against 'fascism and imperialism' had been most forcefully advocated from within a 'national democratic' framework. The Philippine concept of "popular democracy" could be

legitimised as a "substage in the national democratic struggle" by recalling the European Communist tradition of initiating Dimitrov's so-called 'popular fronts' to defend 'bourgeois democracy' against fascism before it was possible to go ahead with more advanced means and aims.⁸⁴

Moreover, while the party organ *Ang Bayan* spoke vehemently about the senatorial and congressional elections scheduled for May 1987, and seemed to rule out any form of participation, the 'national democrats' decided to participate indirectly through a new legal party initiated in 1986 by, among others, Sison and his wife, 'Partido ng Bayan' (PnB), the organisation 'Volunteers for Popular Democracy', (VPD), and certain groups within 'Bayan', which formed the 'Alliance for New Politics'.⁸⁵ ⁸⁶

For a majority of the 'national democratic' leaders 'Partido ng Bayan' seemed to be a way of relieving the movement from paralysing disputes on issues of democracy and participation in elections. Having established the party, most of the activists would instead be able to concentrate on actions among peasants and workers and other sections of the population as well as the armed struggle, while the dissidents would be left alone with at least a formal chance to prove their point.⁸⁷

The results were extremely depressing. Hardly anyone was elected, not even to the Congress. Over-all analyses of the election results reveal a drastic return to the pre-martial law period of 'cacique democracy', to use Ben Anderson's notion.⁸⁸ Most of those elected belong to prominent business cum political 'families'. The radical Left was in no way ready to replace this 'elite democracy' with 'popular democracy'. There was also some fraud, harassment (including the assassination of the chairman of the PnB), and army offensives against the clandestine organisations which enabled the military to control the voting in many radical strongholds.⁸⁹

Despite the Left should have been able to do better.⁹⁰ The 'national democratic' movement as a whole may have been serious about using the elections for propaganda purposes. In the senatorial elections (where the nation as a whole serves as a constituency) this may not have been a matter of dispute. For instance, one of the dissidents who ran as a candidate for the senate, Bernabe 'Dante' Buscayno, claims that he himself told people to listen but not necessarily vote for him.⁹¹ However, he is far from alone in adding that several of the candidates for the Congress could have won if the full capacity of the 'national democratic' movement had been mobilised in support of the candidates and democratic politics.⁹²

To begin with, the forces of the Left were inexperienced and used to boycotting elections. Not even all loyal followers cast their votes. But the real failure was "on the open market". The organisation of the campaign was poor even in terms of supporting the

candidates, getting people to register, and organising activists to protect and count the votes. And certain contending candidates were able to buy their way from sections of the 'national democratic' movement which tried to mobilise resources for the real struggle.

Secondly it was probably even more important that the 'new politics candidates' could only trade progressive ideas—not reliable promises on what to deliver and realistic chances to win. The price which a poor and fragile voter would have to pay in case his 'radical' candidate did not win could be substantial. The 'national democrats' who fought landowners in the fields or capitalists in the workplaces were more interested in, for instance, favourable relationships with the local police and some 'private contributions' than in access to governmental and bureaucratic positions and democratic rule of public resources.

The well established political machines and socio-economically deeply rooted patron-client relationships were thus given a free lease on life and won the day.

The outcome was a loss of face for the Left, but orthodox 'national democrats' may have felt justified. They seemed victorious as the party-leadership closed the internal debate in early-August 1987. While the remaining dissidents in general and the 'popular democrats' in particular were harshly criticised, certain concessions may have been made to those who had suggested urban insurrections. Rural as well as urban offensives were initiated which met with little success but, especially during 1988, exposed many militant leaders as well as vulnerable followers to severe hardships, internal witch-hunts for traitors, and outright state-sponsored terrorism by semi-private vigilante armies.⁹³

While the orthodox leaders resumed their predominance, the legendary founder of the New People's Army and one of the candidates for the senate, Commander Dante, who had long been most sceptical over the policies but had tried to work from within, came out openly with his critique. He was, among other things, against the emphasis on armed struggle, advocated radical politics within the framework of the 'democratic space', suggested that the development of capitalism had created new important contradictions, and most of all rejected all forms of dogmatism.⁹⁴ I shall soon return to his ideas and his new project.

It was not only 'national democratic' hardliners who grabbed for their guns. In the end of August, the first really serious coup-attempt against Aquino by anti-communist officers, who must have felt outmanoeuvred by the politicians after the elections, forced the legal-Left—which had just tried to advance through a popular transport strike against higher oil prices and other applications which had almost paralysed Manila—into defensive positions.⁹⁵ Those who tried to use the 'democratic space' to influence the regime were from now on incapable of do-

ing much more than watching Aquino adjusting her staff and policies to the right.

NEW STAKES IN DEMOCRACY?

While staging new drastic offensives against the regime, the mainstream 'national democrats' also engaged themselves in the nationwide provincial and local elections in early 1988. There were cases where local popular groups succeeded in boosting progressive candidates. But generally speaking the previous attempts to initiate 'new politics' seem to have been replaced by widespread adaptation to what was so obvious in the May 1987 election—a clear tendency toward the restoration of 'cacique democracy'. The 'national democrats' now played the game, and joint business and 'political families continued to score victories—provided that they had come to some kind of agreement in terms of money, various supplies including weapons, a friendly local policeman, etc, with more or less powerful and well armed revolutionaries in their area.⁹⁶

When discussing how the 'national democrats' might approach the coming elections in 1992 Sison as well as Luis Jalandone of the NDF are eager to emphasise "the need to build regional and local alliances and do what is possible within the system, like in the local elections of 1987/88"⁹⁷

'Empowerment'

In face of the electoral failures in 1987 and 1988, the restoration of 'cacique democracy', the revival of dogmatic 'national democrats', frequent coup-attempts, and a weak government drifting rightwards, one of the priorities of the "popular democrats" has been to help vulnerable people 'empower' themselves through their own development initiatives, thereby becoming reasonably autonomous citizens—a basic pre-condition for a more genuine democracy.⁹⁸

This is thus a conscious attempt to combine development efforts and political struggle. Strikes, militant and sometimes armed struggles, pressure politics, etc, are fine. But the emphasis on such methods presuppose that one first must grab political power, then economic power, and finally use all these powers to make people viable and fully capable of governing themselves and the country. If, on the other hand, serious efforts are made to help people to do some labour for themselves (and not only for others) in terms of joint development efforts, they should already at present become viable enough to participate as reasonably autonomous citizens who can stand up for themselves in a more democratic struggle for radical change of society.

In other words: the international discourse on "civil society against the state", and the role of so-called 'non-governmental organisations' in general and social movements in particular (with or without 'green' perspectives), has become increasingly important for the 'popular democrats'—as have the large sums of money available

for such projects on the development-aid-markets.

Much energy has for some time been spent on initiating and stimulating various development projects, including education and popular co-operation, among local cause-oriented groups and community organisations as well as, for instance, within trade unions.

The 'popular democrats' can not protect the activities or, for instance, get rid of a landlord by the use of arms. And their followers, who are usually from the 'middle-class', may be less 'devoted' than the guerrilla soldiers. But the 'popular democrats', can deliver certain goods—at least partly through their access to development funds—and they do address people's livelihood problems in concrete local settings. They can also, in the general debate, put forward grand visions about alternative development strategies.

The idea is, of course, that these projects and movements shall become self sustainable within a reasonable period of time and constitute the basis for local people's councils. This will then, among other things, undermine a good deal of the basis for 'cacique democracy'. People themselves will be able to form and govern parties rather than the other way around. And the same holds true for the organs of the state at various levels.

Actually, similar perspectives and practices have even deeper roots and quantitative importance among many socialist oriented groups and community organisations.⁹⁹ While the 'popular democrats' turn mainly to local activists affected by the 'national democratic' perspective, socialists and social democrats reach out to those influenced by their concepts.

But one cannot stop here. In the Philippines as in India or Indonesia and elsewhere almost every political force, including the religious institutions and some business factions, have created their own environment of so-called NGOs.¹⁰⁰ And every cluster has its international financiers and patrons of various kinds, with various special interests, such as the undermining of the state or other political forces.¹⁰¹

Even president Aquino herself has recently made an attempt to by-pass especially the senate and congress, but also parts of the central administration, by turning directly to various local governors, mayors and friendly old as well as timely established new NGOs, thereby getting hold of the international development funds directed to the NGOs, drawing on some of their success-stories, and reviving her populist 'people power' heritage in face of the 1992 elections.¹⁰²

Finally, the whole process has created huge markets with good opportunities for not only 'organic intellectuals' but also, and perhaps mainly, for more or less devoted, often missionary-minded, and entrepreneurial 'middle class' development organisers with irrelevant experiences and in-

sufficient education.¹⁰³

This is not to say that the genuine efforts to develop foundations for 'popular democracy' are hopelessly undermined from the very beginning. But there is definitely a need for closer studies of the decisive interests involved, both among those who try to 'stimulate' and among their 'targets'. The most serious problem is perhaps that the theoretical and analytical frameworks adhered to by the radicals rarely generate such concern and studies.

For instance, the concept of "civil society against the state" does not help much when attempting to answer questions such as under what conditions different features of democracy become instrumental for various groups and political forces.¹⁰⁴ This is crucial. Most of the actors may be interested in a 'democratic space' wide enough to allow their 'business' to continue without being repressed or regulated by an unfriendly state. But what about the democratisation of existing public administration and resources? What about extending democratic rule to vital resources which are now privately controlled?

Moreover, if funds are available overseas it may be more important to go for a workshop in Amsterdam than to join those fighting political monopolisation of credits in Manila or in one of the provinces. And to what extent are people really 'empowered' and the projects sustainable? Do those who are eager to sustain progressive development projects look for the best possible patron? What shall local activists do when they cannot even start a union or a co-operative because of threats or naked repression?

In a discussion about the problems of combining people's own development efforts with democratic political struggles the largest popular co-operative effort in the country merit special attention.

One of the most important bases for the powerful 'national democratic' movement grew out of the poor tenants in Tarlac, Central Luzon, their leader since the sixties, Commander Dante, and their struggles against Japanese imperialism, Philippine landlords, post-colonial authoritarianism, as well as their own war-lords. The New People's Army was formed here in 1969 and led by Dante. At present, however, the same peasants and the same leader are instead busy laying the groundwork for what may perhaps become a 'New Democratic People's Project'.¹⁰⁵

Dante still claims that oppression under feudal landlords and the Marcos regime was for many years so massive that people simply had to fight illegally, and defend themselves through armed resistance. But in the early-eighties, and after the assassination of his friend Ninoy Aquino in 1983, the situation started to change. From his prison cell Dante argued in vain for, among other things, the participation of the communist-led movements in the snap-elections.

After his release Dante returned as an observer to the highest organs of the Com-

Communist Party. But when not only Leftist incidents on lower levels but also Dante himself claimed that the mistakes were fundamental, he again found himself part of a tiny minority, and came to realise that the movement as a whole was not seriously interested in the 'new politics' that he and others fought for in the May 1987 elections.

The election was no personal disaster for Dante, who received more votes than anybody else in the Left. But when he was personally hit by the violence he sought to avoid, and when the dogmatic leadership closed the internal 'national democratic' debate, Dante spoke out openly and felt that politically he had to start from scratch in Tarlac, where people would also protect him.^{106, 107}

Decades of militant struggle against the, in many respects, feudal landlords in Tarlac had compelled Marcos to initiate a minor land reform in areas where maize and rice were grown. Many of the old sharecroppers were now independent small farmers. As far as they were concerned the anti-feudal struggle for land was over, for all practical purposes.

Instead, they were now exposed to all the disadvantages of capitalism. Their plots were small, and they had no access to support from politicians and bureaucrats. The farmers were therefore not able to acquire the effective production inputs which businessmen sold or rented at good profit. After the harvest, mill-owners and others charged exorbitantly. Middlemen bought cheaply and sold dearly. Most of the farmers were heavily indebted. The workers were given miserably low pay. And of course there was also a scarcity of labour opportunities.

Many had already lost their land. Concentration of land ownership, or at least 'kulakisation', i.e. the growth of a group of rich farmers with their own workers, seemed imminent. Dante therefore suggested that the many small farmers should make use of the new room for manoeuvre under president Aquino, co-operate openly, and seek public credits. By acting in common they could provide more and cheaper input goods, and use them more effectively. Better preparation and irrigation of the fields could be organised collectively. Everyone could harvest their own fields, but the harvest should then be stored collectively, and be sold only on the farmers' own terms, preferably with no middle-men involved. The co-operative could take care of as many bags as were needed to repay the loans, and then ask for new money. Later they could invest in their own mill and in other processing. This, in turn, would give the workers better wages and more jobs.

The peasants shook their heads in disbelief, thinking of all the unsuccessful co-operatives that smart businessmen and politicians had turned to their own profit. But Dante had been able to gain unquestioned confidence among perhaps 500 peasants since decades of dedicated work among them. If for nothing else, they joined out of

loyalty, while the guerrillas in the nearby mountains left their former commander in peace.¹⁰⁸

The next item on the agenda was now not merely to avoid being obstructed by the state, but to get access to sizeable credits. Like Ninoy Aquino, the present governor of the area chose a live-and-let-live relationship with Dante and his peasants. In the presidential palace Corazon Aquino probably neither dared nor wanted to move against a man who had been the friend and prison mate of her assassinated husband during the 1970s.

Late in 1988 the project could be launched.

When I arrived in Tarlac about a year and a half later the 500 sceptical peasants had become more than 4,000 enthusiasts. Their plots, which are still individually owned, comprise more than 8,000 hectares.¹⁰⁹ The sugarcane-growing Hacienda Luisita close by is 2,000 hectares smaller, but is, of course, endowed with more capital. The co-operative is the largest in the country.¹¹⁰ Production has increased drastically. The rice, maize, and beans harvested are stored collectively until the purchasers offer acceptable prices. Even those harvest-time workers who are employed by the farmers themselves get better pay under the supervision of the co-operative. The farmers have been able to repay their previous loans, and are no longer threatened by bankruptcy. The state credits to the co-operative have even been repaid ahead of schedule. As a result they have been able to get even larger loans, from a government which lacks its own success stories, and is doing its best to exploit those of Dante.¹¹¹ In and outside the country even conservative columnists and business reporters write assured and admiring articles about the co-operative.

There are, of course, also problems (such as how much of the net harvest that should be invested or how much to pay those employed by the co-operative). But above all, the co-operative suffers from growth pains causing some problems of organisation and leadership, among other things. More and more people want to enroll. Schools need to be started as soon as possible. The drought is getting serious and there is fanatic digging for water, which in the future may be pumped up by use of windmills rather than with the expensive electricity or diesel. When I was there, top priority was given to the new rice mill, which was inaugurated later on in April.

More than seventy elected local leaders co-operate in some twenty groups, with one co-operative co-ordinator and one technical adviser each, constituting the basis of the central leadership. Internal democracy is 'developed according to the speed at which the peasants themselves recognise the advantages of co-operation'. To prevent infiltration there is a requirement that those who have been employed by the co-operative must have a local base. Those who are to run the new rice mill will also own shares in it,

thereby securing their own interest in its effectivity.

In the main office—with a few long tables at one end of an otherwise empty factory hall which has been rented cheaply, and is used mainly as a warehouse—we discuss the background and development of the left.¹¹² Finally I ask Dante whether he has abandoned politics. Has he become merely a progressive moneylender with good contacts or a managing director for a farmer's co-operative? Does he want to exploit the success story in Tarlac to run for mayor, governor or congressman in the elections in 1992? What about the self-reliance of the project? Can it really stand as a model for other areas in the Philippines?

Dante is conscious of the fact that Tarlac is unique in some respects: the farmers own their land, he himself is a seasoned leader, they can now act quite openly, and they can get considerable credits—which the co-operative is productive enough to repay immediately.

But on the other hand, the preconditions are not extraordinary. The land was not theirs from the start, but they forced the change. The leadership grew with the struggle. Nor is today's room for manoeuvre a gift from heaven, but a product of hard work. And the co-operative is viable enough to pay back its credits even ahead of schedule. Tarlac is not the only place where this kind of thing can be done, Dante says. I am not so sure, mentioning as an example areas where poor peasants cannot organise co-operatives or trade unions because of the landlords' private armies. Dante nods, and says that at least they can now form broad popular defence organisations.

But then he adds that "on the other hand, the whole point is really that we might fail here in Tarlac". The argument is that the project cannot succeed within the parameters of the system. Peasants must have more power.

Dante's big idea is that people do not become revolutionaries in Tarlac or anywhere else just by receiving propaganda, but only through their own personal experiences. Now, when the room for manoeuvre is so much greater than under Marcos, one has to work hard and fast together with the peasants to achieve as much as possible "under existing relations of production". Only when the peasants are themselves confronted with the unavoidably hard opposition from powerful businessmen, politicians and bureaucrats will they be able to develop the common political struggle. "And only then can I decide how I should proceed myself. I am not even sure how far this process has advanced by the time the new elections are held."

How important is the struggle for democracy? Dante believes that most of the peasants are conscious of the need for freedom and possibilities to co-operate, as well as elected politicians and reasonably uncorrupt administrators who can fix loans on favourable terms, are indispensable if they

are to continue. I would argue that this heavy dependence on—and motive to fight for—not only civil rights and freedoms, but also for political rights and a democratic state administration can partly be explained by one factor specific to Talarac: in contrast to many other important development organisations and action groups in the Philippines, the co-operative in Talarac does not primarily rely on international assistance. But the risks that Dante and all those involved will have to add just to the best possible patrons in order to sustain the individual project are of course great. For how long and to what extent democracy will make sense in Talarac remains to be seen and analysed.

Coalition building

Finally, in addition to the attempts by 'popular democrats' and socialists to 'empower' people as a means to developing better conditions for genuine democracy, the tradition from the *Plaridel Papers* to create a framework for coalitions between various groups within the radical Left has at present become increasingly important and gained some success.

The hard times for the Left may be right for limited co-operation. The mainstream 'national democrats' have faced serious problems, including efficient hard repression since they resumed the armed struggle in 1987. And while many committed activists who have fought oppression and exploitation for many years may become even more devoted but also more isolated—since they find few if any alternative avenues which do not imply that they almost have to start anew—many of those who distance themselves from the mainstream movement do not turn to hard work in alternative projects. Some gains are reported from the labour front, but the student movement is on the retreat. The next military coup attempt may be successful. The recent developments in China and Eastern Europe have generated a lot of questions. And within the clandestine movement there are even difficulties in carrying out simple discussions in face of the outright war declared by the state. Finally, new elections in 1992 must soon be tackled.

One aspect of the just mentioned coalition building efforts is that popular democrats and socialist oriented intellectuals conduct and publish analyses which open up for discussions of what conclusions the many factions could agree upon—rather than on areas of disagreement, while other questions remain to be solved or can be taken up later. This is also reflected in frequent 'public forums' where concerned scholars, leaders, and activists with various ideas and experiences are able to meet and discuss. Lectures, statements and comments are often published.

These are not new phenomena, though they may have become more important. But another feature is at least some leaders within a number of various groupings—including 'national democrats', 'popular

democrats', radical socialists and nationalists, as well as followers of the old Communist Party—have for some time been able to meet and, in an atmosphere of mutual respect, hold discussions around what concrete issues some or all of them should be able to co-operate on.¹¹³

All this has favoured broader actions in questions such as the US-bases, the huge Philippine debt and its consequences for common people, human rights, and a genuine agrarian reform. One could also mention the successful attempts by 'popular democrats' in the provinces to get a broad following behind and respect among the fighting parties for a concept of 'peace zones'.¹¹⁴ Finally it is not impossible that some kind of argument among the various progressive forces can be reached as they face the 1992 elections.

However, these tendencies should not be overestimated. There are not only problems of differing analyses, strategies, and tactics. Everyone concerned carries along assorted bad experiences amassed over the years. Moreover, it is important to remember that coalitions are built mainly on rather short term questions, focusing demands rather than alternatives and relating to traditional pressure politics primarily in the capital. Therefore as 1992 elections approach one can not be sure that the alliances are made compatible with the efforts to 'empower' people and develop bases for more genuine democracy. The coalitions may instead be adjusted to the ways in which sections of the Left related to the best possible patrons within the existing framework of 'cacique democracy' in the 1988 local elections.

V

Towards a Conclusion

The experiences from Communist led political struggles in Indonesia and India indicate that various forms of appropriating surplus through the monopolisation of mainly public communal and co-operatively managed conditions of production—often in combination with privately owned resources which usually are external in relation to the units of production (for instance credits and irrigation) had been difficult to take into proper consideration with the use of predominant Marxist theories. These characteristics may be labelled political rent capitalist. One can study them without abandoning Marxism by extending the analyses of means of production to include also additional vital conditions of production. If these dynamics are vital a lot of people should have a material interest in struggling for demonopolisation though they may vacillate between democratisation and privatisation.¹¹⁵

Clearly the Philippines is much different from both Indonesia and India. The role of the colonial and post colonial state to take one example has been much less decisive in the Philippines despite Marcos' attempts at state led development and his cronism. In

no way does my brief study of the Philippines allow for systematic comparisons with the above conclusions about neglected rent-capitalist features in India and Indonesia. However, it seems to me as if the main reason why it was difficult for almost all sides of the radical Philippine Left to foresee the growing importance of struggle for democracy was that their basic theoretical and analytical perspectives allowed for the identification of main sources of power only outside the political sphere.

In the beginning of this article maximum democracy was defined as the actual capacity of the adult citizens to exercise in various forms equal effective rule over resources which they hold in common without thereby undermining the absolutely necessary prerequisites for this rule.

Democracy was not vital according to most radical Philippine analysts and ideologues. The essential prerequisites for democracy or the "actual capacity to exercise equal effective rule"—were lacking. They had to be fought for. However, this could rarely be done in legal, peaceful, and democratic ways because of the limited rights and liberties available. Furthermore, the essential resources in the society were not even formally public but in private hands. Even if the organs of the state, and public resources had been reasonably democratically governed it would not necessarily have created significantly better preconditions for democracy. Nor would it have undermined the dominating classes: Imperialists, big capitalist compradors, landlords and others who were in command of the real sources of power. These had instead to be tackled head on.

This is not to say that all political analyses were equally square. But even most of the dissidents employed short term tactical perspectives in support of the above mentioned basic views when arguing in favour of—for instance—critical participation in an election. They wanted to start from the actual level of consciousness among the people and win them over step by step, or they wanted to create a revolutionary situation, or they recommended struggle over the control of relatively autonomous institutions, and so on.

On the other hand the more independent dissidents who gave priority also to the creation of autonomous organisations—popular participation in addition to representation pluralism and coalition building, etc.—and have added since some time back the 'empowering' of people within movements and NGOs—usually abstain from basic analyses of which controls of private and public resources should be tackled because such considerations could undermine their attempts to build tactical coalitions. This makes it difficult for most of them to indicate which social forces might be interested in fighting for their democratic model in a longer term perspective. Many different interests and actors are involved, including neo liberals and new patrons. There is thus

need for closer studies of under what conditions, for how long, and to what extent popular movements may find it instrumental to give priority to various features of democracy.

(Concluded)

Notes

- 71 BISIG (Union for the Advancement of Socialist Thought and Action) was founded in May 1986 by radical socialists and Marxists with various backgrounds (including Christian social democracy, trade union work, community activism concerned scholarship, the old as well as new communist movement) For a review of socialist groups in the Philippines, see Paul Petitjean, 'The Trajectory of the Left Forces that Supported Cory Aquino's Campaign', in *International Viewpoint*, No 103, July 14, 1986 See also BISIG, 'The Socialist Vision', in *Kasarinlan*, Vol 2, No 3, 1987, and Francisco Nemenzo, 'Beyond February The Tasks of Socialists' (paper presented at the BISIG founding congress 24-25 May, 1986), in *Kasarinlan*, Vol 2, No 1, 1986

JAYSHREE CHEMICALS LIMITED

It is hereby notified for the information of the public that Jayshree Chemicals Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new division. Brief particulars of the proposal are as under:-

- | | |
|---|--|
| 1 Name and address of the applicant | JAYSHREE CHEMICALS LIMITED 14, Netaji Subhas Road, Calcutta-700 001 |
| 2 Capital structure of the applicant organisation | Authorised 80,00,000 Equity Shares of Rs 10/- each Rs 8,00,00,000/- Issued, Subscribed and Paid-up 18,48,750 Equity Shares of Rs 10/- each Rs 1,84,87,500/- |
| 3 Management structure of the applicant organisation indicating the names of the Directors, including Managing/whole-time Directors and Manager, if any | The names of the Directors of the Company are as under - Shri N D Bangur Shri T P Chakravarti Dr Dara P Antia Shri S K Bangur—Managing Director Shri A K Rungta Shri R Viswanathan Shri S S Ghosh Shri N R Hota Shri M V N R Seshagiri Rao Shri A K Sureka |
| 4 Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division | The proposal relates to the establishment of a new division |
| 5 Location of the new division | 512, Maker Bhavan No III, New Marine Lines Bombay 400 020 |
| 6 Capital structure of the proposed undertaking | Same as in No 2 hereabove |
| 7 In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles indicate i Names of goods/articles ii Proposed licensed capacity iii Estimated annual turnover | Not applicable |
| 8 In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc | The proposal relates to the establishment of a separate division to undertake construction of buildings as contractors |
| 9 Cost of the project | Rs 1,10,00,000/- |
| 10 Scheme of finance, indicating the amounts to be raised from each source | Rs 10 lacs by way of unsecured loans and balance from payments against running bills |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein

K G BALDI
Secretary

Dated, 18th July, 1991

- 83 For an interesting contemporary analysis, see Ed Tadem, 'The Agrarian Question Confronts the Aquino Government' in *Kasarinlan*, Vol 2, No 4, 1987
- 84 A clandestinely distributed discussion paper written under the pseudonym 'Pepe Manalo' and later on published under the title 'Political Strategy and the Political Negotiations'. It is interesting to note that this terminology was later on applied by the top-communist leaders when 'Popdem Question' was discussed as late as in early 1988, others maintained that it might not merely be atactic but could even serve as an alternative programme (*CPP Document Captured by the Authorities from the Archives of Rafael Baylosis in Early 1988*). At least as early as 1987 the organisation 'Volunteers for Popular Democracy' was included in the National Democratic Front, although identified as having a shallow role as a united front tactic. The argument that there was a need for a strategic conceptualisation of the legal struggle was, however, regarded as problematic, and it was stated that the 'popular democrats' had initiated co-operation with 'non national democratic progressive forces' without the approval of the party (*Captured minutes of the CPP CC Plenum* January 6 March 18, 1987)
- 85 'Bourgeois elections and Parliament Props for Counterrevolution' *Ang Bayan* No 4, March 1987
- 86 For a report on the formation of 'Partido ng Bayan' see *Midweek* Vol 1 No 36 October 1 1986
- 87 Indirectly confirmed by Sison and his wife in interview, May 3 4, 1990. Sison himself has written that the 'Partido ng Bayan' could "relieve the legal mass organisations and alliances of the burden of having to debate and divide over whether to participate or not in voting exercises". They could instead concentrate on fundamental sectoral and multisectoral issues and simply decide and set forth the criteria for influencing the electoral process". Sison and Werning *The Philippine Revolution*, op cit, p 169
- 88 Ben Anderson 'Cacique Democracy' op cit
- 89 See *Condensed Report on the May Elections*, Institute for Popular Democracy (Quezon City 1987) and summaries of a survey and analysis of political clans in the Philippines carried out by the same institute in *Conjuncture* (published by the Institute for Popular Democracy), Vol 1 No 2, and in *Far Eastern Economic Review*, September 14, 1989, which also included additional material (Cf also Ed de la Torre, 'Structural Obstacles to Democratisation in the Philippines II: Continuing of Political Clans' in *Conjuncture*, Vol 1, No 7, June 1988, and the report in *Far Eastern Economic Review*, May 21, 1987). I draw also on interviews with the director of the institute, Clark Soriano March 20, 1990 and would like to thank Ben Anderson for fruitful conversations on related issues of his 'Cacique Democracy'
- 90 To get an idea of some expectations, see Ed de la Torre, 'Electoral Etudes' in *Midweek*, Vol 2, No 23, May 13, 1987
- 91 Interview, March 26, 1990. The chairman of PnB claimed, however that Dante was out for votes (*Midweek*, Vol 2, No 37 September 23, 1987). And many seemed to agree on the fact that the radical alliance should have abstained from the senatorial elections and concentrated on the Congress. For a presentation of the 'Vanguard of the 'New Politics', the Magnificent 7' see *Midweek*, Vol 2, No 19, April 1, 1987
- 92 Here and below I draw especially on interviews with Dante, March 25 and 26, 1990, Joe Castro, previous leading member of PnB and one of its candidates for the Congress, March 25, 1990, Horacio Morales, candidate for the senate, March 27, 1990, Etta Rosales, leading member of Bayan and PnB, March 23, 1990, Ed de la Torre, leading member of VPD, May 3, 1990, Clark Soriano, director of the Institute for Popular Democracy and in charge with their studies of the elections, and on the interview with Fidel Agcaoli, chairman of PnB in *Midweek*, Vol 2, No 37, September 23, 1987
- 93 For one general review, see Gregg R Jones, *Red Revolution*, op cit, pp 162f and 239 ff. It might also be interesting to note that the chairman of the Manila-Rizal Committee, Filemon Lagman, who in 1978 revolted against the party leadership by suggesting critical participation in the elections and thereafter was purged, has now resumed his position as he is reported to be in favour of armed urban actions and 'insurrectionist' perspectives, *Far Eastern Economic Review*, August 23, 1990, p 18ff
- 94 See the interview with Dante (Panayan kay Dante hinggil sa stratehiya) in *Diliman Review*, Vol 35, No 3, 1987
- 95 For interesting analyses, see *Kasarinlan* Vol 3, No 2 1987 and Francisco Nemenzo, 'A Season of Coups' in *Kasarinlan*, Vol 3, No 4, 1987
- 96 I continue to draw mainly on many of the sources mentioned in relation to the May 1987 elections (Cf also Gregg R Jones, *Red Revolution* op cit, p 310f)
- 97 Interview with Jalandoni, May 3 and with Sison May 3 4 1990
- 98 I am mainly drawing on interviews with Isagani Serrano Philippine Rural Reconstruction Movement January 19 March 20 and May 29, 1990 and Clark Soriano, Institute for Popular Democracy January 19 and March 20 1990, Horacio Morales, March 27, 1990, and Ed de la Torre, May 3 1990, plus various issues of *Rural Reconstruction Forum* and *Conjuncture*, and Ed de la Torre's *The Politics of Popular Democracy* (Horacio Morales's *Political Economy of Popular Democracy* (Quezon City: Institute of Popular Democracy 1986), *Selected Speeches Isagani Serrano* (Quezon City: PRRM 1990), and by the same author *Developing a Fourth Generation NGO Strategy* paper to the 31st International Training International Institute of Rural Reconstruction October 11, 1989. See also Alex Magno 'Popular Democracy as apolitical form' in *Diliman Review*, Vol 34 No 3 1986
- 99 I am particularly thankful for discussions with Karina Constantino David, professor of Community Development and formerly Aquino's deputy secretary for social affairs and development, and herself an activist in the field, March 28 1990. See also her *Community Organisation and People's Participation*, paper for a seminar with the Dag Hammarskjöld Foundation Uppsala May 1984, and *The New Politics: Lessons from the Democratic Struggle in the Philippines* (manuscript 1988) available with the library of the UP Third World Studies Centre)
- 100 The dogmatic 'national democrats' are no exception. If for no other reason, they need their own NGOs to raise money (Confirmed off record by leading members.)
- 101 I continue to draw on the interview just mentioned with Karina Constantino David, (Cf also Karina Constantino David 'The Limits and Possibilities of Philippine NGOs in Development', paper for the University of the Philippines Round Table discussions on participation, March 9, 1990), and would also like to thank, among others, Mario Bolasco, for sharing his analysis of the role of the Church, interview March 19, 1990
- 102 Her movement is called KA BISIG (linked arm in arm)
- 103 In relation to this and the two paragraphs above, I am especially thankful for private communication, dated July 26, 1990, on a review of some foreign aid projects and several NGOs in the Philippines
- 104 Cf my 'Communists and Democracy: Two Indian Cases and One Debate' op cit
- 105 For the following I am mainly relying on discussions and interviews with Dante and Fatima Penilla Buscayno, his companion and additional propelling force within the project, January 21, and March 24-26, 1990, their unpublished paper 'Co-operatives: A Self Help Approach to Poverty Alleviation', (February 1990), and news clippings
- 106 Directly after a TV show where he had analysed the election results, terrorists attacked his car with submachine guns, but were only able to murder two of his friends and seriously wound two others. See also Fatima Penilla Sibal's story in *Diliman Review*, Vol 35 No 3, 1987
- 107 See the interview with Dante in *Diliman Review*, Vol 35 No 3 1987
- 108 At present the mainstream national democrats' are unhappy with Dante and his project (interview with the representative of NDI Luis Jalandoni, May 3, 1990, and with Sison May 3 4 1990), while dissidents are often favourable, though eager to stress certain special features in Iarlag which I shall return to
- 109 According to written communication with Fatima Buscayno (August 12 and October 20 1990) the project has since then grown steadily and expanded into an additional district (no 1) in Iarlag and the Pampanga and Nueva Ecija provinces. Some 8,000 farmers are now involved
- 110 Property of the Cojuangcos, including Corazon Aquino
- 111 Even the then agrarian secretary Florencio Abad told me (March 20 1990) that Dante is and I understand him tired, of being used by everybody by the government by various groups, by everybody
- 112 The office has since been moved to the new rice mill
- 113 I draw on interviews in March 1990 with people more or less directly involved. I am also told that a more open attitude has been authorised by the top 'national democratic' leadership
- 114 See eg Henry GP Isaac Jr 'The Naga Popdem Experience', in *Conjuncture*, Vol 3 No 4 1990
- 115 For the general conclusion see my *What's Wrong with Marxism* Vol 1 and 2, op cit. For a previous attempt to study when democracy made sense for communists in West Bengal and Kerala, see my *Communists and Democracy*, op cit

بنك عمان المحدود
Bank of Oman Limited

Bombay Branch

NOTES FORMING PART OF THE ACCOUNTS FOR THE YEAR ENDED 31ST MARCH, 1991

1 Significant Accounting Policies

- The Balance Sheet and the Profit & Loss Account have been prepared in conformity with Forms A & B of the Third Schedule to the Banking Regulation Act 1949
- Foreign Currency Translation
 - Assets & Liabilities in Foreign Currencies are translated at the rates notified by FEDAI as on 31st March 1991 and Contingent Liability in respect of forward Exchange Contracts and Letters of Guarantee are included at the contracted rates
 - Outstanding forward exchange contracts are revalued at the rates notified by FEDAI as at 31st March 1991 and resulting gains or losses on revaluation are credited or charged to income as the case may be
- Investments
Investment in Securities of the Central & State Government and other Trustee Securities including treasury bills of the Central and State Governments Shares Debentures or Bonds, other investments are valued at lower of cost or market value on a global basis
- Advances
 - Provision for Bad & Doubtful debts
The Provision for Bad and Doubtful debts is made to the satisfaction of the auditors after considering the value of realisable securities held by the bank in respect of such advances and other related factors till date. In cases where the bank has made no provision for bad and doubtful debts in respect of advances considered doubtful to the satisfaction of the auditors appropriate disclosures have been made to that effect
 - Advances are stated net of bills of exchange rediscounted and specific provision in respect of bad and doubtful debts
 - Provisions have been made on a gross basis. Tax relief which will be available when the advance is written off will be accounted for in the year of write off
- Premises Furniture and Fixture
 - Premises furniture and fixtures equipment and vehicles have been valued at cost less depreciation
 - Depreciation has been provided on all the assets at the rates specified in Schedule XIV to the Companies Act 1956 on written down value method for the whole year including additions made during the year
- Income Recognition
 - Interest income is recognised on accrual basis and in the case of fully & partly non-performing advances the same is recognised on recovery and settlement
 - Commission and fees charged are credited to income at the time the transactions occur
- Gratuity.
Provision for gratuity to Staff has been made on an accrual basis as certified by the actuary. Separate trust for Gratuity is yet to be set up

h) Head Office Administration Expenses

As per the past practice Head Office Administration Expenses are not charged to the Profit & Loss Account

2 Provision for Income Tax

- Provision for income tax has been made on the basis of the stand taken by the bank in the return of income and appeal filed by it with the assessing authorities. Pending outcome of the appeal/assessments the additional tax liability if any, cannot be ascertained

- The Bank is of the opinion that the decision of the Honourable Supreme Court regarding the taxability of interest on sticky advances in the case of State Bank of Travancore v/s CIT is not applicable in cases where no interest has been charged on sticky accounts. The bank has therefore not made any provision for income tax in respect of cases where no interest has been charged on sticky accounts. Loans and Advances considered good include

- An amount of Rs. 256.90 lacs being advance against shares pledged by borrowers with the covering letter only are considered as fully secured as per the legal opinion obtained by the bank
- An amount of Rs. 978.54 lacs given as a bridge loan to a borrower company against the public issue of convertible debentures supported by letters of comfort given by some of bankers to the issue are considered as commitments by the management and hence considered good and fully recoverable
- An amount of Rs. 204.47 lacs due from a borrower company secured by tangible assets which is identified to be a sick industrial company under the Sick Industrial Companies Act

- In cases where the Bank has made no provision for Rs. 6,884,038.30 in respect of bad and doubtful advances the balance as on 31st March 1991 in the Unremitted Profits Account is considered adequate to cover the after tax impact of subsequent losses if any arising out of these advances. In view of the steps being taken for the recovery of these advances it would be premature to quantify such losses

5 Particulars of Remuneration paid to the Chief Executive Officer (*)

| | Previous Year | Current Year |
|---|------------------|-------------------|
| | 14.89 to 5.11.89 | 14.90 to 31.3.91* |
| Salary & Bonus | Rs. 124,466.90 | — |
| Perquisites evaluated in accordance with Income Tax Rules | Rs. 20,154.00 | — |
| Total | Rs. 144,620.90 | Nil |

(*) There is no Chief Executive Officer posted at the Bombay Branch of the Bank during the year under audit

- The previous year's figures have been regrouped/rearranged wherever necessary

AUDITOR'S REPORT ON THE INDIAN BRANCH OF BANK OF OMAN LIMITED UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949

We have audited the attached Balance Sheet of the Indian Branch of BANK OF OMAN LIMITED as at 31st March 1991 and the relative Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date signed by us under reference to this report

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act 1956 the Balance Sheet and the Profit and Loss Account together with the notes attached thereto are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act 1956. The accounts are therefore drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act 1949

We report that subject to and read with the foregoing remarks

- We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory
- The transactions which have come to our notice have been in our opinion generally within the powers of the Indian Branch of the Bank

- In our opinion proper books of account as required by law have been kept by the Indian Branch of the Bank so far as appears from our examination of these books maintained and produced to us at Bombay

- The above mentioned Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account. In our opinion and to the best of our information and according to the explanations given to us the Balance Sheet and Profit and Loss Account together with the notes thereon and subject to

- Note 9(b), regarding provision for tax not made and interest not charged on sticky advances

and

- Note 4 regarding provisions not having been made for certain bad and doubtful advances of Rs. 6,884,038.30

give the information required for Banking Companies and on such basis give a true and fair view in the case of the Balance Sheet of the state of affairs of the Indian Branch of the Bank as at 31st March 1991 and in the case of the Profit and Loss Account of the profit of the Indian Branch for the year ended on that date

Understanding Fakirmohan

Biwamoy Pati

RABI SHANKAR MISHRA and Jatindra Naik (January 19, 1991) raise certain points centred around my paper/rejoinder (April 8, 1989 and October 20, 1990). It is really surprising to find Mishra and Naik accusing me of highlighting Fakirmohan Senapati as a champion of the language of the peasants. My basic thrust was to locate Fakirmohan's shift to the 'spoken' language from the 'high', Sanskritised Oriya, in a context when the existence of Oriya as an independent language was being questioned. It was *not* my remotest objective to present the case for Fakirmohan. In fact, I had tried to project exactly the opposite of what I have been accused of—i.e., how the language of the peasant was appropriated by an upper caste/class Oriya intellectual to demonstrate the independent identity of Oriya. Hence my point that the peasants' language saved Oriya from being obliterated—a feature yet to be recognised, given the hegemony of upper caste/class values.

Mishra and Naik seem to make a 'historic block' out of Fakirmohan. It is not my intention to establish who was a 'greater' writer (?)—Fakirmohan or some writer of the 1930s. For that matter, as far as 'greatness' or complexity of vision is concerned one need not even go to the 1930s. Here one can refer to Bhima Bhoi, a blind, tribal poet, a contemporary of Fakirmohan, as long as he is accepted as a creative person, given the domination of upper caste/class values and the reverence for literary canons. Bhima's humanism, universalism and popularity need to be delineated while referring to Fakirmohan. Two lines from this poet gives us an idea of his vision

Let my soul be condemned to hell,
But let the universe be redeemed

It is from their acceptance/construction of Fakirmohan as a 'historic block' that Mishra and Naik approach the question of perceptions of agrarian tension within literary texts. Their analysis pivots around a 'no-change'/'static' perspective. This implies that they do not provide any space for developments, the human agency and interventions between Fakirmohan's time and the 1930s.

Mishra and Naik attempt to whitewash Fakirmohan's role in the Bhuyan rebellion (Keonjhar, 1891). What they dismiss as "an expression of local grievances of some tribal leaders" was in actuality an anti-imperialist/feudal movement with a long history. Keonjhar saw a series of attempts by the British to interfere in its affairs in the 19th century. This, coupled with the oppressive feudal structure, provided the basis for a series of Bhuyan uprisings, culmina-

ting in the 1891 'meli' (revolt), chronicled by Fakirmohan. The way the British bailed out the princely state and rescued Fakirmohan (the assistant dewan of Keonjhar) from the rebels, who had imprisoned him, illustrates the broader linkages of this rebellion most unambiguously. More importantly, Fakirmohan's own account bears testimony to his upper caste/class construction of the tribal in revolt.

My point regarding Mangaraj's poverty-stricken background has been grossly misunderstood. My argument was that perhaps Mangaraj's 'upstart' origin was significant to Fakirmohan. Possibly the upper caste/class notions of the Oriya intellectual and his desire to preserve the social hierarchy shape Fakirmohan's construction

of Mangaraj as wicked and vicious—the 'upstart *nouveau riche*' appears to be the target of criticism. I have obviously nowhere suggested that Fakirmohan located all poor people as 'bad' (or, all rich people as 'good')!

My positions on Sachidananda Routroy are articulated elsewhere. It is fine if one decides to criticise him for his 'links' since the late 1940s. However, I would request Mishra and Naik to produce a single evidence to show that he was associated with the structures of feudalism or capitalism in the 1930-40 period. These 'links' with and recognition from the latter developed *only* after his compromise and retreat. To say that few Oriya literary critics understand the discipline of history and few historians/social scientists of Orissa care to use texts for historical and social analysis is too sweeping a generalisation to be worthy of any comment.

THE THEORY OF CAPITALIST DEVELOPMENT Principles of Marxian Political Economy

by

Paul M. Sweezy

(Original Publisher: Monthly Review Press, New York)

As a work in political economy this book begins with the simplest elements of Marx's thought, his method, use of abstraction, and analysis of the commodity and of the relations between labour and capital, and concludes with the most complex categories of modern society: the historical tendencies of the capitalist system, corporations, international economy, fascism and imperialism.

LNTAS HLL C OM 7 2015

His savings may be small but his returns need not be.

People used to believe they needed to invest large amounts to earn high returns. Now they know it's not true. Unit Trust has shown them that even on small savings they can earn high returns.

This is possible because as a mutual fund, Unit Trust is able to pool together resources of small investors. It uses the skills of its financial experts to invest these funds on the share market. The result is a higher return for the small saver. Year after year.

At Unit Trust, our commitment to the small saver remains unchanged. For 27 years. Even today, 84% of our investors have holdings of Rs 10,000 or less. And to join some schemes, Rs 500 is all you need. Though most people do invest more.

With Unit Trust, people know they can get what they want. That is why the number of Unit holders is going up so spectacularly. To over one crore today — 35 lakh investors joined last year alone.

These are people from every part of the country. From every walk of life. They have different needs, different dreams.

But they share the same abiding confidence in Unit Trust. Living up to this confidence is what keeps us going. And growing.

UNIT TRUST OF INDIA

At the service of One Crore Unit holders.

Registered Office 12-13 90, Street No 3 Tarnaka Secunderabad 500 017

Public Issue of 63,00,000 Equity Shares of Rs.10 each for cash at par

HIGHLIGHTS

- Promoters with wide experience in industry
- Setting up 2500 TCD Sugar unit Also holding licence for alcohol and alcohol based chemical units which are proposed to be set up subsequently
- Latest equipment from Buckau Wolf India Ltd — a renowned supplier of sugar plant and machinery
- Ideal location in close proximity to cane rich areas for assured cane supply*
- Professional Management
- Minimum Gestation - Production expected by November 1991
- 80M, 80L and Wealth Tax Benefits
- Listing at Hyderabad & Bombay Stock Exchanges

* "With proper effort for exploiting the cane potential, the mill can easily expand its capacity to 10,000 TCD."

Vasanthdada Sugar Institute, Pune

Risk Factors Prospects also depend upon climatic conditions and policy of Government of India

Perception of Management Major portion of command area is irrigated. Any future change in Government policy should be for the better in view of increasing demand for sugar

ISSUE OPENS ON 7TH AUGUST, 1991

In case the Company does not receive the minimum subscription of 90% of the amount of the present Offer the entire subscription will be refunded to the applicants within 90 days from the date of closure of the subscription list. If there is a delay in refund of such amount by more than 10 days the Company will pay interest at the rate of 15% per annum for the delayed period.

Oustees of Chandil Dam

THE displaced people from the Chandil dam, a part of Subarnarekha Multi-purpose Project (SMP), sat on an indefinite hunger strike from July 2 in front of the office of the superintendent engineer, Chandil dam at Chandil. The hunger strike organised by the displaced peoples' organisations namely Visthapit Mukti Vahini and Icha Kharkai Bandh Visthapit Sangh ended on July 11 after a written assurance by the project authorities that their demands would be met very soon. With the onset of monsoon, the issue of rehabilitation of 11,675 families has created a sense of despair, uncertainty and tension among the oustees as their homes will be inundated this monsoon.

The SMP authorities claim that the rehabilitation of the displaced people will be done such that the present living standard would not only be maintained but increased substantially. But in the rehabilitation plan conceived and implemented by the authorities there is no special provision to provide employment opportunities. Similarly, no investment plan for the scheme to provide employment to the oustees has been made. About 600 jobs meant for the oustees of SMP as a part of the rehabilitation programme have gone to non-oustees.

The rehabilitation plan prepared by the SMP authorities has not been implemented. The villagers of Durri have raised objections against low compensation but have no option other than accept the meagre amount. The 32 oustee families have lodged their cases at the office of the additional magistrate (land acquisition) at Sarakela. No hearing has been made in this regard so far. When the villagers of Baksai refused to accept the meagre amount, the SMP authorities threatened the villagers with dire consequences and delayed payments which forced the villagers to accept them.

Similarly there is a continuous agricultural plot of 20.8 acres in the village Moisada. The SMP authorities have given compensation for only 12.8 acres on the pretext that 'their' map shows only 12.8 acres of land.

Nearly 50 families were displaced without any compensation to pave the way for colonies to house project officials and engineers working at the dam site. Last year in the villages Odiya and Kudaktapa, nearly 360 and 100 acres of land were submerged respectively. This land was not declared submerged and has so far not even been acquired by the authorities. On June 7 the villagers of Durri met the administrator who assured them that their village would not come under sub-

mergence that year. A few days later, B K Roy (a rehabilitation officer) went to this village and told the people that their village would be completely submerged this year and the people should start moving elsewhere.

In April 1991, a time-bound programme was formulated for the visits of rehabilitation officers to every village which would be submerged and for listening to the grievances of the affected villagers. But no rehabilitation officer has come to the villages yet. In December 1990 the government of Bihar issued a revised rehabilitation policy for the affected people from SMP. As per this policy, every oustee of 18 years and above who owns less than five acres of land will get two acres of land or Rs 10,000 for the purchase of land and additional Rs 15,000 for preparing the purchased land for cultivation. Secondly, every oustee will get Rs 20,000 for the construction of a house. The type of land bought for Rs 5,000 per acre will take at least 10 years to make it fit for cultivation purposes. What will the oustees do in this period? The SMP authorities have decided to release the amount of Rs 20,000 for the construction of houses in three instalments. This is not only troublesome but also expensive in the long run.

To assess the environmental damages and losses, the project authorities are supposed to carry out detailed studies and follow up action plans to rectify the damages. Just one study was commissioned which was carried out by a private agency, Metaplanners and Management Consultants based in Patna and was completed in less than a year in 1990. Incidentally this study was commissioned after the work on the project was started. Much of the information in this study derives from government data, rather than fresh independent empirical data. Such a study can hardly be passed off as a legitimate environmental study. The World Bank has also expressed its unhappiness over this study. In fact, they have pressurised the project authorities to again carry out a detailed technical, economic and environmental study of the project. The revised study will be carried out by an independent agency in the coming months. While the work on the project is going on, the project authorities have yet to receive formal environmental clearance from the ministry of environment and forests.

New Delhi

KAVALIJI SINGH

Against IMF Loan

THE Association of Indian Economics Studies, Madison, USA, was founded in

1975. Its ninth bi-annual conference took place two weeks ago in Chicago. This conference discussed the economic situation in India and our members are concerned with the growing problems of the economy. At this conference, all the attending presidents of the association felt strongly about the need for a debate on the forthcoming negotiations with the IMF and drafted an open letter to the new prime minister, P V Narasimha Rao, which is reproduced below.

Congratulations on your election to the high office of the prime minister of India. As you have rightly pointed out in your first press conference, India continues to face severe economic problems. One of the major problems relates to the shortage of foreign exchange and the need to service external debt. A large amount of gold has already been reportedly sold. Your government will now seek another loan from the IMF since such a loan seems quite attractive, certainly in the short run. It seems that IMF and World Bank are also keen to give a loan to India. We suggest that your government assess seriously before it accepts another loan from the IMF. IMF loans are based on 'conditionality'. The earlier 1981-82 IMF loan imposed serious conditions and propelled India towards the debt trap—a situation in which India finds itself today. Reports suggest that this time the IMF is planning still harsher conditions such as devaluation and privatisation that will drive India into a deeper debt trap from which it may be impossible to get out. As the experience of countries like Brazil and Mexico shows, IMF 'conditionalities' are determined by highly biased economic analyses based on outdated ideologies, such as the infallibility of market solutions, that lead to low growth and anti-social policies. IMF policies help the short run at the cost of degenerating the long run problems. Devaluation, privatisation and export-led growth theory remain discredited. There is little hope that these will solve India's economic crises even its external debt problem. India is a large country, has enough potential to develop alternative means to solve its economic crises and needs to learn from the successes of Japanese and other similar economies. It can and should negotiate hard for the desired loans without mortgaging its economic independence, security and future growth for an immediate gain.

In view of the importance of this issue and the expertise of its members, the Association of Indian Economics Studies is organising a whole session on 'IMF Conditionality and Indian Economic Crisis' at its next economists' meeting in New Orleans.

ROMESH DIWAN

Rensselaer Polytechnic Institute, New York

Single-Point Budget

THE budget for 1991-92 addresses itself essentially to a single-point agenda. This was perhaps to be expected in view of the insistence of the IMF on the government of India bringing down its fiscal deficit to 6.5 per cent of GDP in the current year from the level of 8.4 per cent in 1990-91. Accordingly, the budget estimates presented by the finance minister this week show a reduction of Rs 5,604 crore in the fiscal deficit, from Rs 43,331 crore as per the revised estimates of last year to Rs 37,727 crore in 1991-92. This is sought to be achieved, hopefully, by raising the government's revenue receipts by 17.7 per cent while restraining the growth of its total expenditure to 6.3 per cent, both over the revised estimates for 1990-91. That is the arithmetic of it which, going by past experience, could prove tragically fragile. The budget for 1990-91, for instance, had hoped to contain the growth of the government's total expenditure at 6.9 per cent whereas the actual increase has turned out to be 14.9 per cent as per the revised estimates for the year and as a result the fiscal deficit which was expected to be Rs 36,795 crore has floated to Rs 43,331 crore. The political economic omens, in terms of the strengthening of inflationary pressures and the more government without a majority in parliament and assailed by dissensions within its own party and by aggressiveobbies of different interest groups, are scarcely more propitious in the current year for the fructification of the finance minister's expectations.

But more than the fragility of the budgetary arithmetic is at stake. The reining in of the government's total expenditure to show the fiscal deficit to be of the precise dimensions permitted by the IMF has been achieved by a massive slashing of capital expenditure, the rise in which is budgeted to be less than 1 per cent over the revised estimate for 1990-91. The finance minister's claim to have provided for a respectable 12.6 per cent rise in the budgetary allocation for plan expenditure is more than a little misleading because here again it is plan expenditure on revenue account which has been budgeted to rise by a whopping 21.7 per cent whereas the allocation for plan expenditure of a capital nature shows an increase of a mere 4.5 per cent. This demure withdrawal of the government from investment activity is, of course, what the IMF's diktat insists upon but against the background of the generally acknowledged onset of recessionary conditions in the economy is this such a good thing to happen even going by conventional economic wisdom?

The finance minister is not lacking in good manners. He

has not omitted to mention the need for special care to see that the burden of what he calls the 'fiscal correction' does not have to be borne by the poor. He has provided, *inter alia*, Rs 2,100 crore for rural employment generation under the Jawahar Rozgar Yojana. As it turns out, this is exactly what the programme had been allocated for 1990-91. In other words, employment creation for the rural poor has been denied any share in the 12.6 per cent increase in the plan outlay the budget takes credit for. And given the sharp rise in prices all round, the unchanged allocation for the Jawahar Rozgar Yojana must mean fewer person-days of employment even at the same money wage rates (meaning sharply reduced real wages in view of the steep rise in the prices of the basic necessities of life). But that is not the worst of it. How well will the budgetary allocations for rural employment generation and other such programmes stand up once powerful interest groups start their game of asking for more—for instance, once rich farmers all over the country decide to tell the finance minister what he can do with his funny idea of doing away with the fertiliser subsidy or once exporters, having digested the devaluation bonanza, set up a chorus about the country's exports being in jeopardy unless the government forthwith restores the export subsidy? In his budget speech the finance minister has already assured the prosperous farmers that they "will be compensated for the proposed increase in the price of fertilisers through suitable increases in procurement prices". Now, the price of rice in the wholesale markets rose by over 13 per cent in 1990-91 and that of wheat by nearly 49 per cent and the government's own *Economic Survey* is quite categorical about the contribution of enhanced procurement prices to these price increases, it points out, "the increase in prices of cereals, particularly rice and wheat, was attributable to the substantial increases in procurement prices and the consequent rise in issue prices which set the trend for open market prices". All the same the finance minister is ready with his assurances of further increases in procurement prices.

With the IMF holding the government's nose to structural adjustment and the powerful and the rich brooking not the slightest interference with the good life they have been used to, something has to give and what can that be but the measly allocations for employment, social services and such like? Such a denouement has been rendered virtually inevitable by the way the finance minister has chosen to go about stitching together his proposed 'fiscal correction'.

CAUVERY DISPUTE

Evading the Issue

RIVERS have always aroused strong emotions. Quite apart from their role in the community's economy, or perhaps emanating from this, they become integrated into the cultural and social fabric of the people who live around them. Any threat to a people's right over river waters can then be easily construed and projected as a threat not only to the livelihood but to the long standing life styles of the people concerned, even if this is not really the case. Inevitably these become political issues and have to be acknowledged and dealt with as such. The problem with the manner in which the Cauvery dispute (and for that matter, every other river dispute in the country) has been handled is that the attempts at resolving it have baulked at recognising this reality and have in fact tended to deplore the supposed 'politicisation' of the issue. In effect, technical administrative and judicial solutions to the problem have come to founder in the political squalls.

The Cauvery dispute in its present phase is a typical illustration of this phenomenon. Attempts to arrive at the so-called equitable distribution of waters have been constantly bogged down by disputes over the veracity of the relevant statistics regarding the volume of water and the irrigated areas etc. provided by the two states. Even if a specially constituted body were to conduct extensive surveys for these data, they would still be disputed. Such a body of data would become operational only if there were agreement between the disputing parties on the manner in which river waters might be shared. And this is a political exercise. The setting up of a tribunal was not a wholly acceptable decision for either state and, given the course of discussions prior to its setting up and later, it could more or less have been foreseen that the tribunal's orders, interim or otherwise, would have been challenged by one or the other states. Karnataka's contention that the interim order did not take into account the volume of water available in the river in laying down the minimum volume to be released to the Mettur dam is as valid as Tamil Nadu's claim that without these waters the 'kuruvar' crop in the delta were at risk. In other words, the essence of the disagreement about the interim order was the same as the issue which gave rise to the setting up of this tribunal (and other similar adjudicating bodies in the past). Karnataka's response of passing an ordinance ostensibly protecting the Cauvery waters, but in effect nullifying the interim orders of the tribunal, not only makes a mockery of the judicial processes, but sets unsavoury precedents. The centre's deci-

sion to seek the advice of the Supreme Court is an expression of its inability to come to terms with the political content of the issue.

In the meanwhile, of course, much water has flown down the Cauvery, literally. The river in spate, overflowing the 70 year old Krishnarajasagar dam and inundating the famed Brindavan gardens, has forced Karnataka to release waters such that the Mettur dam is likely to be full this season, for the first time in a decade. The irony is that despite there being enough waters, the tribunal's orders will probably continue to be challenged by one or the other state, the Karnataka ordinance will come to stay and the Supreme Court will work at its own pace to devise a solution.

POLITICS

Premium on Chauvinism

Will India be going the Yugoslav way? It appears that Nehru and Tito who had worked hard in consolidating the solidarity of the third world countries did not succeed appreciably in developing inter-regional amity within their own federal polities. The triangular conflicts among the Yugoslav federal centre, Slovenia and Croatia bursting into intermittent hot wars on the one hand and India's embroilment with secessionist violence in the states of Jammu and Kashmir, Punjab and Assam on the other have already proved the point. The recent aggravation of the quarrel between Tamil Nadu and Karnataka over the sharing of the Cauvery waters has only revealed another dimension of the simmering tensions within the pluralistic entity that is India. Political manoeuvres, including the resignation of the Tamil Nadu Congress (I) president from the union government and the threat of withdrawal of support to it by the AIADMK MPs and the unarticulated threat of a similar move by the Karnataka Congress(I) members in the union government and parliament have been backed by a simultaneous 12 hour bandh in both the states. The centre's tentative move to remove the strife from the streets to the quieter arena of the Supreme Court's sanctuary may succeed in soothing the nerves, but only temporarily. The issue has now come to the present level of confrontation after decades of meandering through the corridors of negotiation and arbitration.

The Cauvery water dispute, however, is not the only flash point of inter-state confrontation nor is it the hottest so far. The inter-state boundary dispute between Assam and Nagaland has led to warlike actions by the state armed forces on more than one occasion. The favourable background for the solution in all such cases has to be sought in the cultivation of

fraternal relations among the various communities of the Indian people, overcoming their manifold divisions. This can be sought to be achieved only on the basis of a credible perspective of shared benefits from an all-round development of the country as a whole. With the gradual dimming of such prospects, only the centrifugal pressures can gain momentum.

Earlier the Indian communists at least sought to intervene in the critical developments of this nature with a degree of goodwill. When tempers had been running high over the Bihar-Bengal merger proposal, mooted by the late B C Roy in the fifties, the secretaries of the Bihar and Bengal units of the CPI met to draw up a common platform for joint action. Similarly, for a time the communists also tried to intervene soberly in the Maharashtra-Karnataka dispute over Belgaum. Now, of course, with the high premium gained by chauvinism of all sorts even in the former socialist paradise, discretion is deemed to be the better part of valour.

THE BUDGET

Blurred Figures

EVEN if one were to look at the central budget on its own—forgetting for the moment that it is part of the package of closely interconnected measures that the new government has taken since it took over—the very first thing that strikes one is that while compared to the interim budget presented by the Chandra Shekhar government in February, the reduction in the fiscal deficit is only Rs 748 crore (from Rs 38,475 crore to Rs 37,727 crore), the measures proposed to raise additional revenues and to reduce certain non-plan expenditures add up to amounts several times as large. Thus the additional taxation proposed in the budget is estimated to net Rs 2,617 crore in the current year, with the centre's share coming to Rs 2,005 crore. On the expenditure side, the abolition of the export subsidy along with the subsidy on fertilisers and sugar should save the exchequer a sizeable amount (the overall saving of Rs 1,726 crore shown in the budget appears to be a gross underestimate). The question arises then about where all these amounts have got absorbed, since the reduction in the fiscal deficit is relatively so small.

As one probes the figures, one notices that the provision for non-plan expenditure in the budget is higher by Rs 2,790 crore in comparison to that made in the interim budget. On the plan side there is virtually no difference between the interim budget and the budget under review. True, the finance minister has shown a reduction in the revenue deficit of Rs 3,912 crore over the interim budget. But since revenue receipts are projected to show a

net improvement of Rs 3,945 crore and with the economy measures referred to above, why has it not been possible to make a larger reduction in the revenue deficit? In this context, the large step up in the provision for interest payments, by as much as Rs 5,600 crore, is intriguing and has gone unexplained either in the budget papers or in the budget speech.

While the finance minister has underlined that for non-plan expenditure, excluding interest payments, defence and major subsidies, the budget provision he has made "reflects a reduction of Rs 1,538 crore compared with the provision in the revised estimates for 1990-91", he has overlooked to explain the enormous increase in the provision for interest payments. The three major heads accounting for the increased provision are market loans, provident funds and small savings. Together the increases under these three heads add up to Rs 5,721 crore. On the other hand, there is hardly any increase in interest receipts. Take small savings, of which three-fourths are supposed to be channelled to the states. Should not a corresponding increase in interest collections from the states have been provided for?

The more tongue-tied the finance ministry is with respect to the budget, the more natural it is for outsiders to suspect that everything is not right with the figures. In this particular case, given the general belief about the sacrosanct nature of interest liabilities as contractual obligations and therefore the tendency in general to accept the figures unquestioningly, could it not be an attempt on the part of the mandarins of the ministry to exploit this credulity and make an over-provision? Surely, the finance minister owes everyone an explanation of why he has had to provide for such a large increase in non-plan expenditure in general and interest payments in particular.

RESERVATION POLICY

Congress Dilemma

THE five-member constitution bench of the Supreme Court has categorically demanded from additional solicitor general Altaf Ahmed the present government's clear-cut stand on the August 13, 1990 notification on the implementation of the Mandal Commission's recommendations issued by the National Front government. The additional solicitor general's attempt at evasive action by citing the reference, in the president's address before parliament on July 11, to the government's commitment "to special measures in favour of socially and educationally backward classes" was curtly dismissed by the bench.

The Supreme Court's firm demand is a welcome departure from its earlier ambiguous pronouncements, most notably

the orders of September 11, September 21 and October 1, 1990 in response to the prayer of anti-reservationist petitioners for a stay of the implementation of the August 13 notification until the court had given a final verdict on its constitutional validity. Each of the orders was ostensibly a clarification of the preceding order, yet the orders only became progressively more ambiguous.

While today the roles are reversed with the government being ambivalent and the court seeking a clear statement, many questions remain. The court had fixed November 6, 1990 as the date of commencement of hearing of the petition challenging the constitutional validity of the notification. The matter was of sufficient public and political importance and had generated large scale violence in parts of the country and caused the fall of the then government. It is surprising that the court should have dragged its feet on so important a matter as to be seeking clarifications from the government nine months after the scheduled commencement of the hearings.

More importantly, the petition relates to the constitutional validity of the notification. It is therefore unclear as to why the present government's stand is so crucial a concern. The bench has sought from the government not a clarification on the modalities of the reservation arrangement but "a categorical statement whether it supports the stand of the previous government on the reservation issue or not". It may reasonably be assumed that the constitutional status of the notification has little to do with the position of the government of the day. Perhaps the Supreme Court is unwilling to hand down a clear cut ruling itself.

This notwithstanding, the court's demand may have its positive aspect of compelling the Congress(I) to discard its vacillating opportunism. Neither in its election manifesto nor in statements subsequent to assuming office has the party made its position clear on the issue save for feeble interjections on the introduction of some economic criterion to determine backward status. This ambivalence is not without reason. From August 1990 on a vociferous section of the party has been advocating the implementation of the commission's recommendations. Electoral compulsions made ambivalence a party programme.

The latest outburst has come from welfare minister Sitaram Kesri who has instructed his ministry to proceed with the job of making out a foolproof case for reservations with a view to ensuring a favourable verdict from the court. The party's cabinet committee on political affairs also favours a pro reservation stand. Yet opposition from those like Arjun Singh and S B Chavan can be expected to

be stubborn. It remains to be seen how a party already faced with dissent on the new economic adventures of the government tackles so contentious an issue.

POLITICAL PRISONERS

Specious Argument

IN West Bengal, there are a little over 4,500 undertrial prisoners. Among them there are 21 Naxalites whose duration of detention varies from four to 11 years. Following a long drawn out legal battle for their release, the Calcutta High Court issued an order on April 5, directing the state government to "take necessary steps for releasing the undertrial Naxalite prisoners within 13th April, 1991". In his order, the judge, Dilip Kumar Basu, commented "I think and hold that detention of most of the political prisoners is illegal and in violation of their fundamental rights as contemplated in Article 21 of the Constitution of India". He directed the state government's home secretary to submit a report to him on April 19, complying with his directive. On that date, the state's advocate general turned up at the court to plead that the court "in its infinite wisdom be pleased not to direct release" of the prisoners. His arguments were that three of the prisoners were already convicted and were serving sentences. One had not yet been served a charge sheet and, as for the remaining 17, none of them had been "illegally detained for periods longer than the maximum terms prescribed for the offence(s) for which they could have been sentenced, if convicted".

This dangerous argument implies that anyone can be held in detention without trial for a period which could be prescribed for him if he is convicted of the charge brought against him. If someone is hauled up on the charge of murder, and if the punishment is life sentence, the government can keep him in jail for that period without bothering for an early decision to prove whether he is guilty or not. At the end of a trial, if he is proved innocent, what redress can he have for his incarceration, which becomes palpably illegal? How can the advocate general be sure that all these 17 prisoners will be convicted and sentenced to terms of imprisonment covering the period which they have undergone till now?

The West Bengal government's defence through its advocate-general—has several chinks. First, despite a Supreme Court order that charge-sheets against prisoners should be issued within two and a half years, in most of the cases of the 21 Naxalite prisoners in the state's jails, charge-sheets were issued much after the stipulated period. Secondly, none of the prisoners was produced before the

court every six months, as stipulated by the law. The last time they were brought before the court was in 1988. Further, while the advocate-general denied that these prisoners were "prosecuted for being Naxalite, extremist or for political reasons" (thus refusing to accept them as 'political prisoners'), the inspector general of prisons of the state had earlier in a statement to the court (January 31) admitted that they were Naxalites.

The hurdles that the Left Front is putting up in the tedious legal proceedings mock at the very concept of speedy justice. West Bengal's Marxist rulers quite rightly protest against the arbitrary arrests and detention of their comrades in Tripura. But they have no qualms in treating their political opponents in their own state in the same arbitrary fashion. For the hack advocates of the governments of the two states, there has never been any dearth of specious legal arguments in defence of violation of the citizen's right to liberty.

SOUTH AFRICA

ANC Forced to Get Tough

ON the basis of what in retrospect seem to have been entirely spurious claims to have initiated radical reforms towards majority rule, sedulous efforts have recently been made by a host of western governments to dignify the status of the racist South African state. Their ill-concealed enthusiasm for lifting sanctions against South Africa despite opposition from anti-apartheid groups is part of this project of securing the racist regime's place in the 'comity of nations'. This notable foreign policy success altered the domestic political equations, giving de Klerk a clear advantage in negotiations over the ANC which was increasingly being expected to retreat from previously held attitudes commensurate with the reforms initiated.

But some of the fruits of this statesmanship seem to have been squandered through an excess of cunning. The credentials of the 'authentic liberal' whom the west saw and promoted as an alternative to the ANC have been tarnished by damaging revelations of a direct official role in the ANC-Inkatha conflict and the vicious township violence. This confirms the charge that the beleaguered ANC has consistently levelled against the de Klerk government.

Nico Basson who worked for 15 years with the South African defence forces in various sensitive positions has corroborated that the township violence was engineered by Pretoria as part of an overall plan to weaken and destroy the ANC. Basson, who had participated in a similar operation in Namibia aimed

against the SWAPO, charged that the campaign was geared towards retaining white control by fostering an ethnic divide within the majority race by linking the Zulus to Inkatha and Xhosas to ANC and incorporating the former into the system as an alternative to the ANC. The government has been forced to concede the veracity of the charge to the extent of admitting that R 100 mn had been spent in the campaign against SWAPO and that a total of R 1.5 bn had been spent on secret projects over the last five years. These figures were disclosed by foreign minister RF 'Pik' Botha who also claimed he had a clear conscience. By apartheid standards there is nothing incongruous about the claim.

The turn of events has proved fortunate for the ANC which in recent months had been pushed on the defensive, making a series of concessions on armed struggle, on nationalisation, on the pace of change and so on. Compounding the problem came the township violence. To make matters worse the recently-held first national conference elected a headline national executive council, one of whom, Patrick Lekota, had in full conference denounced Nelson Mandela's authoritarian tendency to impose his will on the internal decision-making process. Caught in a trap that is by and large of his own making and forced into conceding too much ground, this is just the right opportunity for Mandela to revert to a sterner line. The ANC's new demands go beyond merely seeking the resignation of defence minister Magnus Malan and law and order minister Adrian Vlok. Mandela has called for a new government of national unity and the creation of a constituent assembly.

This hardening of ANC's attitude will further strain relations with the de Klerk government and create obstacles in the negotiation process. So long after the exposure the ministers in question continue to be part of the government while another senior minister has defended the government's manoeuvres. Even as de Klerk puts on display his various democratic virtues, his government has seen fit to take no action against those directly involved. Even if de Klerk himself is not part of the conspiracy, negotiations may still prove to be difficult since the issue is not one of intentions but of consequence. Irrespective of de Klerk's intentions it is clear that recalcitrant segments of the state repressive apparatus and apartheid hardliners are able to take steps which have serious consequences with impunity. It is perhaps just as well that the NEC of the ANC is dominated by hardliners. Suspending armed struggle without any guarantee from the state to suspend its own armed struggle is counter-productive.

TWENTY YEARS AGO

EPW, Special Number 1971

The Sino-American *détente* has obviously upset some of the basic assumptions of Indian foreign policy. It was more or less taken for granted till now that the United States would want India to be a strong and stable power in south Asia, more so in view of its impending withdrawal from its deep involvement in Vietnam. A related assumption seems to have been that, even while it disengaged itself, the United States would not wish to allow conditions to be created in any part of this region favourable to the emergence of a situation such as that which developed in Vietnam earlier. It was firmly believed for this reason that the United States would at least remain neutral regarding Bangla Desh, even if it did not play a more positive role in working for a satisfactory political settlement.

These assumptions and expectations have been falsified at least for the present. The desire of the United States to normalise its relations with China is, of course, not only understandable but to be applauded. This is what India has urged all along since the early fifties. The thaw in Sino-American relations cannot therefore by itself be a matter for concern. What was not expected was the manner in which the United States chose to open up—more particularly the cynical fashion in which it ignored the issues raised by the massive genocide in Bangla Desh and used the present government of Pakistan as its favoured intermediary at this critical stage. If anything became evident from all this, it was that neither these issues nor what was at stake for India were of any great concern to the United States.

★ ★ ★

Pakistan is perhaps the only ally of the United States in this region which has not only no misgivings about its normalising relations with China but has a great deal to gain from it now. Add to this the simple problems of logistics—finding a base from which the presidential envoy could fly non-stop to Peking and back and the fact that the use of the regular PIA service would not be noticed by anyone—the choice of Pakistan for this particular operation is not difficult to understand.

Nevertheless, would the United States be appearing to function in such open support of the present government of Pakistan if it foresaw the possibility of its being cut to size by Bangla Desh successfully breaking away or if it expected India to act more forcefully in defence of its own interests? One cannot be sure of the answer to the first part, but to the second one can offer at least a tentative answer. If the United States was certain that India would retaliate in response to the massive inflow of refugees from Bangla Desh, and that such action would find support not only from the Soviet Union but from public opinion elsewhere (including its own), one would expect it to have shown more hesitation and be less blatant in its collusive operations with Pakistan.

Success through Value Added Products

BHADRACHALAM PAPERBOARDS suffered a 3 per cent drop in production from 83,923 tonnes in 1989-90 to 81,558 tonnes in 1990-91. This was mainly due to floods which stopped operations for three days and labour unrest for almost four weeks during the year under review. As a result, capacity utilisation remained lower at 130 per cent as compared to 134 per cent in the previous year. The situation was aggravated further by powercuts and shortage of diesel due to the Gulf crisis.

Although the volume of sales declined from 84,888 tonnes to 81,212 tonnes, net sales realisation showed an increase of 11 per cent. The market which was buoyant throughout 1989 turned sluggish from October 1990 especially in the packaging segment. However, product development,

value addition and quality upgradation helped the company to increase the turnover. Several new high value products were developed through research and development to cater to emerging demands. The R and D expenditure incurred by the company at Rs 0.71 crore formed 0.60 per cent of net turnover. The quality of products gave the company a competitive edge in the international markets. As a result, the foreign exchange earnings during the year under review registered an increase from Rs 3.77 crore to Rs 6.47 crore.

Notwithstanding an increase of 9.8 per cent in raw material cost, 10.1 per cent in power and fuel cost, 5.5 per cent in labour cost, the profits before tax registered an increase of 66 per cent over the previous year. Thanks to large investments in the tax saving units of UTI, the company did

not incur any tax liability during the year under review as against Rs 1.52 crore in the previous year. As a result, profits after tax spurted by 99 per cent to Rs 15.60 crore from Rs 7.84 crore in the previous year. The company paid dividend at the rate of 37.5 per cent as against 32.5 per cent in the previous year.

In order to minimise dependence on forest based raw materials, the company used recycled fibre, both indigenous and imported. However, doubling of custom duty on waste paper from 20 per cent to 40 per cent and on pulp from 5 per cent to 10 per cent and also the stringent measures to curb imports coupled with 25 per cent higher rate of interest on borrowings to finance imports caused considerable financial strain on the company in particular and the paper industry in general. The foreign exchange outgo largely on account of recycled fibre was Rs 13.98 crore as against Rs 17.14 crore and the net outgo after setting aside the export earnings was Rs 7.51 crore against Rs 13.37 crore in the previous year.

During the year under review, the company issued fully convertible debentures worth Rs 30 crore. The long term borrowings of the company showed an increase of 55 per cent resulting in a higher debt-equity ratio of 1.781 as against 1.501 in the previous year. The improvement in operating profits provided a higher interest coverage ratio of 3.21 as against 2.65 in the previous year. A modest increase in the current ratio indicated the better working capital position resulting from increase in the loans and advances to the extent of Rs 6.50 crore.

The funds flow of the company during 1990-91 amounted to Rs 48.12 crore. Reserves and surpluses improved by Rs 11.49 crore and depreciation by Rs 6.39 crore. The internal sources accounted for 37 per cent of the funds. The major chunk of 61 per cent of the funds was utilised for tax saving investment in UTI units. As much as 19 per cent was invested in fixed assets while 14 per cent was utilised for loans and advances.

The company continued its effort to make substantial investments in modernisation towards achieving market expansion. The completion of the second phase of modernisation, further research and development, quality upgradation and widening of high value added product range are expected to give a further boost to production during current year. The company also proposes to diversify into the business of financing investment, leasing and hire purchase by setting up a subsidiary company with an investment not exceeding Rs 5 crore.

TIN PLATE COMPANY

Profits under Pressure

TIN PLATE COMPANY, the largest producer of tin plate in the country with a market share of 68 per cent, witnessed a fall in electrolytic tin plate (ETP) production from 56,041 tonnes to 51,892 tonnes during the year ended March 1991. As a result, the capacity utilisation of the ETP plant was lower at 58 per cent than 62 per cent in 1989-90. However, 52,220 tonnes of TMBP coil were processed and the prime yield in ETP increased to 83 per cent from 78 per cent in the previous year. Production of hot dip plant (HDP) was affected due to the power crisis in the eastern region during the first half of the year. Although the year witnessed an all time high production of over one lakh tonnes of black plate/galvanised corrugated and plain sheets, capacity utilisation remained lower at 98 per cent than the 136 per cent in the previous year. The one silver lining was that the company showed an increase of 11 per cent in sales realisation during 1990-91.

The company was able to reduce the overall expenses-to-sales ratio to 0.97:1 from 1.03:1 during 1990-91 despite a substantial increase in power and fuel and also labour charges. The operating costs of the company increased only by 5 per cent from Rs 10.98 crore to Rs 11.54 crore. Interest charges on account of working capital funds was reportedly less since the company availed of a six-month supplier's credit on import of TMBP coils and the resultant financing cost was included in the raw material cost. However, the interest on term loans was higher on account of financing of HDP modernisation. As a result of fall in interest charges, the gross profits before depreciation showed an improvement of 22 per cent over the previous year. However, profits before tax moved up only by 10 per cent due to higher depreciation charges on account of addition to capital assets in the HDP. Net profits, however, fell steeply by 17 per cent due to the significantly higher tax provisions.

The company showed improvement in the profitability ratio measured in terms of gross return on sales and total capital employed during 1990-91. Assets utilisation showed improvement with the sales to assets ratio at 1.95:1 against 1.52:1 in the previous year. However, the return on shareholders' funds was lower at 9.30 per cent against 11.52 per cent in the previous year.

Technology absorption, adaptation and innovation included processing of double reduced TMBP coils for manufacture of electrolytic tin plate, development of cans fabricated from double-reduced tin plate

for providing economic packaging to canners and use of tin-free steel for edible oil and vanaspathi packaging.

Although the HDP was set to achieve a record performance, the current year may not be smooth for the ETP which depended on imports for 83 per cent of its raw material. The foreign exchange used for import of raw material during 1990-91 amounted to \$ 29.6 million against which export earnings were negligible. The devaluation of the rupee will have considerable impact on the cost structure of the company. The company has initiated steps to indigenise the source of raw materials for the ETP plant by commissioning a TMBP manufacturing facility.

VST INDUSTRIES

Puffing Profits

VST INDUSTRIES, with a market share of 11.3 per cent in cigarettes, made a significant improvement of 43 per cent in turnover during the year ended March 1991. Despite a phenomenal increase in cost of raw materials and labour charges, the company was able to bring down the expenses to sales ratio from 1.06:1 to 0.99:1 in 1990-91. Profits before tax at Rs 32.58 crore, including the net capital gains of Rs 13.62 crore arising out of disinvestment of shares in Bhadrachalam Paperboards, showed a spurt of 177 per cent over the previous year.

The physical performance of the company showed a set back compared to the previous year. Production of cigarettes fell from 11,635 million pieces to 11,253 million pieces in 1990-91 showing a fall in capacity utilisation from 35.3 per cent to 34.5 per cent. Production of paper conversion products also fell to 8.90 tonnes from 9.33 tonnes in the previous year.

Profitability ratios improved considerably during the year under review. The gross return on net sales increased from 14 per cent to 24.78 per cent while the gross return on investment spurted to 30.48 per cent from 16.14 per cent. The net return on shareholder's fund more than doubled from 15.12 per cent to 40.33 per cent. Investment to sales ratio showed improvement from 1.15:1 to 1.23:1 in 1990-91.

The company achieved a good measure of success in tobacco exports, including export of non-traditional varieties. Tobacco exports increased over seven fold to Rs 415 lakh during 1990-91. Although cigarette sales to West Asia suffered a set-back, the company seized the opportunity offered by the Russian market and increased exports significantly to Rs 157 lakh. Further, the company made a beginning by exporting agri-products worth

Rs 437 lakh to Europe and the Far East. The thrust on exports enabled the company to increase aggregate export earning to Rs 1,009 lakh as against Rs 125 lakh in the previous year.

Funds flow during the year under review was Rs 30.51 crore. The internal sources at Rs 30.51 crore formed 67 per cent of the total, while trade dues accounted for 29 per cent. This was mainly used for financing investment in UTI units which formed 45 per cent of assets formation. Financing of inventory accounted for 35 per cent while gross fixed assets accounted for 11 per cent.

The company has identified certain concrete proposals for diversifying and in particular plans to widen its agri-business which is regarded as highly profitable.

IN THE CAPITAL MARKET

Cauvery Electronics

CAUVERY ELECTRONICS, a running company belonging to the Bush group in the field of colour and B/W TV sets, will enter the capital market on August 12, with a public issue of 18.20 lakh equity shares of Rs 10 each at a premium of Rs 5 each, aggregating Rs 273 lakh. The company has an installed capacity to produce one lakh sets of black and white and colour television sets at GIDC Electronics Estate, Gandhinagar. During the 11 month period ended February 1991 the turnover of the company at Rs 11.29 crore showed a fall of 24 per cent (on annualised basis) mainly due to the general shrinking trend in the domestic market coupled with loss of production on account of restructuring of production facilities to cater to the export market in western Europe. During the year ended March 1990, the company had paid dividend at the rate of 25 per cent, amounting to Rs 60 lakh. The paid up capital of the company as at February 1991 amounted to Rs 64 lakh including preference share capital of Rs 4 lakh. Reserves and surplus stood at Rs 178 lakh. The book value per share works out at Rs 39.67. The borrowing was Rs 633 lakh. The debt equity ratio was 2.73:1. The interest coverage ratio was 2.17. The total capital employed was Rs 1,394 lakh. The gross fixed asset amounted to Rs 632 lakh and accumulated depreciation was Rs 220 lakh. The object of the present issue is to meet working capital needs of the company for ensuring smooth operation. Besides, the company also plans to use a small portion of the present issue for financing various normal capital expenditure. The object of the issue also includes listing of the share at Bombay and Ahmedabad stock exchanges. The company has haggled an export order for 50,000 TV sets and is reportedly negotiating with a number of overseas agencies to increase exports. It also plans to diversify its activities. The company operates a studio which is equipped with the most advanced Beta Cam editing facilities and computerised animation system. It also incorporates video to film conversion equipment.

Calcutta Diary

AM

There is just one uneasy thought: After all this solemn drama of wholesale capitulation in advance, suppose the Fund fails to cough up, or does not cough up to the extent New Delhi hopes it will. Who then goes where?

THOSE thirty-five economists, who wanted to say something different, cut a sorry figure. Nothing behoves this nation as conformity does. Editorial articles in the newspapers have a shrill, unifying theme. Assorted once-advisers to former prime ministers, half-a-dozen former governors of the Reserve Bank of India, superannuated politicians, superannuated *danseuses*, smugglers released on parole, sports people who had perhaps come sixth or seventh in a heat of an Olympic event a score of years ago, congregate under the canopy. It is almost as if another war is on against China or Pakistan, patriotic emotions gush. In the evening cocktails in New Delhi or Bombay, painted ladies and their consorts experience a surge of empathy with each other, is it not a throbbing historical occasion, all of them are in it together, there was no alternative to devaluation of the rupee, nor to recourse to the International Monetary Fund, the nation was living beyond its means, but Indians have that extra something in them, when the hour of crisis dawns, few amongst them are found wanting, they have proved the point, they have been unflinching in their resolution, the nation's sovereignty needed to be surrendered to the Fund and the World Bank, the country's interests demanded that this be done, servility, who does not know, is patriotism, love for the market, who does not know, is salvation.

Whoever disagrees does not quite belong. Either he is not quite there, or he must have fallen prey to some utterly stupid alien ideology. Fortunately, in stances of such waywardness are few and far between. When the crunch comes, even the parties in the opposition realise instinctively that they have to be on their best behaviour, one or two *in camera* sessions with the prime minister and the finance minister, the opposition leaders look suitably grave as they emerge from these sessions, it is not done to rock the boat at this critical juncture of the nation's life, politicians, the occasion demands, must behave like statesmen, the country is facing the direst peril, do not ask what the government can do for the opposition, ask what the opposition can do for the government. It would have been nice if

there were prior consultations with them, it would have been nice if the IMF conditionalities were divulged to them, you can not however accuse the country's loyal opposition of being bereft of either maturity or patriotism. The poor finance minister himself has perhaps not been informed fully about these conditions, they are unending. Be that as it may, the nation must be in it together, one or two amongst the members of the opposition even deem it proper to call on the lady with the dark glasses at number 10, Jan Path.

Whoever is not with us is against us. There cannot be any joining of issues, consensus has already decided the matter, devaluation was unavoidable, going to the Fund was equally unavoidable. The living beyond the means phase in the nation's life must end, each one of us has now to strive for the economy attaining the highest level of efficiency. The newest adjective to make the grade is 'vibrant'. Whoever questions the devaluation and the capitulation to the Fund conditionalities is *ipso facto* against a vibrant economy. Such a person is, by consensus, an enemy of the nation. Liquidate him, either for his bad economics or his bad verse.

In this cacophony, the essential point is missed. Perhaps it was always the intention that the point be missed. Running to the Fund and the World Bank and signing on the dotted line do not signify self-abnegation, but precisely its reverse. Those who matter in this nation are determined to eschew the path of independent economic development. They cannot do without foreign goodies, they will not economise on the use of foreign exchange. A default in servicing outstanding obligations on account of past debts would have endangered the uninterrupted flow of foreign exchange. That peril had to be avoided at all cost. Ladies in the cocktail circuit have nothing to worry about. The IMF conditionalities will not inconvenience them. Swings and roundabouts. Their fathers and husbands and paramours will extract fabulous premiums from the sale of exim scrips in the open market, the demise of CCS is more than bearable. The foreigners who will henceforth take charge of our destiny are a full of exciting no-

tions; they will teach us to accept the quintessential reality of the market, of what we called till yesterday the black market, which brings supply and demand into equilibrium, equilibrium is tranquillity, it is Euler's Theorem eliminating the scope of factor exploitation.

The fallacy has a class bias. It is simply not true that the nation as a whole has been living beyond its means. It is only a minor segment of the nation, the top-most decile, which has lived it up since that egregious doctrine of borrow and spend, borrow again and spend again, became official policy in the eighties. The forthcoming ceremony of tightening the belt, promised to be as impressive a spectacle as trooping the colour outside of Buckingham Palace one particular day in the year, will not however affect the rich. Because the government they control have delivered the country to the Fund and the Bank, they will be let off. True, the increase in the rupee cost of imports consequent to devaluation will hurt some of them at some places, there will however be compensations elsewhere. Food and fertilisers subsidies, both of which add to the coffers of big farmers and rich peasants, can be expected to be kept out of harm's way. And already there is talk of some of the export subsidy being exempted from the ambit of the new trade policy. Since the Five Year Plan is to be shelved, and only an apology of an Annual Plan will do duty, development outlays can be pruned on the quiet to the extent of two thousand five hundred to three thousand crore of rupees. Additional revenue of around a couple of thousand rupees can be raised by excise imposts on essential articles and key intermediates. Scaling down the fiscal deficit to this extent should for the present propitiate the foreign masters. It could be explained to them that given the susceptibilities of international armament merchants and commission agents, it would be unwise to reduce defence spending that would also not go down well with the Vishwa Hindu Parishad brigands, who have to be kept in good humour. The inextricable interrelationship between defence preparedness and internal security cannot be ignored either. The nuclear lobby too will heave a sigh of relief.

The economising will mostly target on outlays intended to provide relief to the poor and middle classes. Employment creating rural works will be mercilessly slashed, the midday meal and similar other nutritional schemes will be pruned, the public distribution system catering to the working class and the urban poor will be rationalised, literacy and educational programmes will receive a heavy battering.

Power rates for non-bulk consumers will be raised, and subsidised public transport, a scandalous luxury the indigent sections had been privileged to enjoy so long, will be brought to an end. A fair number of public sector units, assiduously built over the period when *Izvestia* was not yet aware of the facts of life, will be dismantled, if not, a sizeable chunk of their shares will be disposed of in the open market. Either stratagem will help to narrow the fiscal gap. The banks and financial institutions will be put up for part sale, thereby fetching some more money for closing the income expenditure hiatus in government accounts.

The Fund and the Bank are agreed that no direct taxes be imposed on the affluent classes. The latter will therefore be left free to enjoy their foreign exchange allotments. Ambrosia for the gods, dollars and deutsche marks for India's indolent set. A few import based and small scale units they manage will go to the wall, but the expansion of the comprador sector now that private foreign investments are, according to the finance minister, to pour in, will hopefully make up for all that. For since Indians too are going to be market loving, and all ceilings and regulations will be eliminated, there is little reason why the transnational corporations will not begin to feel comfortable here. Confident predictions have already been forthcoming from the most wise quarters: two to three billion dollars worth of foreign private investment might start flowing in each year. If such predictions are slightly off beam, it is because of the excitement of the season. The current annual intake of private foreign capital is less than one hundred million dollars. Even were New Delhi to deregulate all controls, scrap MRTPA and IDRA and FERA, meekly give up on the issue of patents and intellectual property rights, a twenty or thirty fold increase overnight in private foreign capital inflow could still be a pipedream. Investors from rich foreign lands are wont to consider the political and cultural ambience of the countries that invite them to go in. They are not ignoramuses. They will get to know about Punjab, Kashmir and Assam, about the Swedish engineer, the Israeli tourist, and Sergei Gritschenko. They will also, rest assured, be informed about the riots likely to occur across the length and breadth of the country following the hike in prices of essential consumer articles and key intermediate products so as to satisfy the Fund conditionalities. Devaluation in any event will steeply raise the rupee cost of all imports, and the latter will go up in volume because that is one of the things

the Fund and the Bank have been insisting upon. The double-digit inflation will therefore assume a runaway form. As the finance minister has forewarned, unemployment will increase once outlays are cut back. Stiff anti trade union laws, to be placed on the anvil in accordance with Fund Bank wishes, will additionally contribute to the fun.

In the quarter of a century since 1966, the Indian rupee has depreciated to the extent of at least three hundred per cent. Exports as a proportion either of the country's national income or of the total volume of global trade have hardly showed any improvement though. An occasional spurt in exports in individual years has been on account of special circumstances, the depreciating rupee has had little to do with it. Many brave words were spoken in 1966, the same words are being repeated now by officialdom, but the confidence behind the words seems to be wavering, and for good reason. Conformity is not by itself enough. Prices have already started to rise on a wide front. Export optimism in this situation is of as little relevance as a nonagenarian's carnal desires. Assuming the Fund releases the eagerly sought foreign exchange, that will go to meet the servicing burden of past debts and to foot the bill of liberalised imports. The Indian ruling class will temporarily re-experience the bonanza of the mid eighties. The more things change, the more however they will remain the same. The stock of foreign exchange will once more be run through in three to four years' time. By then, the internal political crisis will deepen. At that stage, alongside importuning further foreign exchange, the nation's ruling class will also perhaps beseech the induction of foreign troops without which it will be impossible to put down the insurgencies rearing their head one after another.

For the past several decades, the whole of Latin America has been the exclusive theatre of operations for the Fund and the Bank. There is not one success story they can quote for each and every Latin American nation, the debt crisis has grown more and more intractable. And since Fund Bank prescriptions do not change, the poor are being squeezed out of existence. The rich set however survive and prosper. There are also other victories notched up. Even Nicaragua has been salvaged in the nick of time. Fidel Castro's day are numbered, you only have to read *Izvestia* which these days contains all the news.

So what, it is an impressive coup the Fund Bank establishment and their native collaborators have pulled off. Chandra

Shekhar had his life's ambition fulfilled, he and his finance minister did not have a clue what their appointees were plotting, the latter did not feel the necessity to tell them, they had, like the chief election commissioner, a direct line to Rashtrapati Bhavan. The new government is in a minority, so what, none will dare to vote it out. Besides, no risk is being taken, the Lok Sabha will be presented with a series of *fait accompli*. A subjugated nation cannot afford the luxury of democratic pretensions. Please do not ask the pointless question whether no alternative was available to the nation, whether curtailing imports to the extent of around 4 per cent of national income and restructuring the economy on the basis of domestic technology, domestic resources and domestic market demand are non feasible propositions. The alternative available to the nation was not acceptable to the ruling class, period. Self reliance is an impractical word, it goes against class interests. We must globalise, and must learn to be market loving. The loss of freedom is a small price to pay for that glorious thralldom. The loss of freedom does not hurt the top decile, it hurts only the poor.

The budget says it all or nearly all. There is just one uneasy thought. After this solemn drama of wholesale capitulation in advance, suppose the Fund fails to cough up, or does not cough up to the extent New Delhi hopes it will? Who then goes where?

Two of the Three Faces of Capitalism

Arun Ghosh

How does one provide employment and a minimum income to every adult member of the workforce? That is the most important problem to which our policies must be directed in the coming years

ONE has to take one's hat off to the functioning of the democratic system—as far as the media are concerned—in the USA. There still exist papers and journals which are no respectors of personalities, the imposing facades of the so called institutions upholding democratic traditions (in particular, the law enforcing machinery) or the working of the corporate system and the functioning of the economy. Take but two samples. The *Business Week* (McGraw Hill, New York) datelined February 25, 1991, has this to say about 'the Gulf War and on the US government plans for a reduction in the consumption of fossil fuels. "The Gulf War is in large measure about access to oil. And volatile energy prices have taken motorists on a six month roller coaster ride and pushed some US airlines into bankruptcy. For the most part Bush simply wants markets to control energy price and supply. And as long as prices are relatively low and supplies plentiful that seems to suit voters. 'Americans regard cheap gasoline as a birth right' says Robert Lbel vice president at Dallas energy company Enserch Corp.

Nobody would accuse the *Business Week* of being a radical paper, but you have the above piece from a team of four experts, Peter Hong and Howard Gleekman; with Tim Stewart, in Washington and Robert Buder in New York. They have, well after the Gulf War was won resoundingly (at little cost to the US taxpayer, and with considerable gain to the US armaments industry), blown the lid about the rationale behind the US intervention in west Asia late last year. Several writers in India have also made bold to say so, but have been accused of being anti-American by persuasion. I am merely quoting four Americans writing in an otherwise conventional American journal.

The sad fact is that after the Gulf War was won, and oil prices plummeted, the energy conservation measures (in the US) which had been proposed earlier—again I quote from the same article in the *Business Week* of February 25—and which are now in dispute are—Mandating a 40 per cent rise in corporate

average fuel economy standards for car makers (estimated savings 2.5 million barrels of oil a day by 2005)

—Establishing an energy conservation standard for electric lights (estimated savings Approximately \$ 800 million per year)

Exempting energy efficiency rebates given by public utilities from taxation (estimated savings 7 billion to 10 billion kilowatt hours per year)

Granting tax credits for electricity produced by such renewable sources as solar thermal, geo thermal, wind, photo voltaic or biomass methods (estimated savings 630 000 barrels of oil per day by 2000)

Creating a fund to finance energy efficiency programme for federal facilities (estimated savings \$ 1.5 billion over 10 years)

(Source: Data Energy Department Alliance to Save Energy, BW)

Of course we in India ought to have woken up to the need for energy conservation long ago and the sad fact is that for quite some time the government at the centre has been concerned not with national priorities but the immediate task of its own survival. However that is a separate matter and we are at the moment discussing a world issue, not an issue of importance to the Indian economy.

And now the second sample. In two issues (datelined July 17 and July 24, 1989), the *New Yorker* has published an account from A Reporter at Large on 'Big Sugar', the report being filed by Alec Wilkinson. The condition of the workers on the plantations of the United States Sugar Corporation (at Azucar and Clewiston, Florida) are what can only be described in our terminology as those of 'bonded labour', drawn from as far as Alabama, Mississippi, and emigrants from Haiti and Jamaica. Let me cite the fate of just one worker (Allen Slayton of Tuscaloosa, Alabama) as reported by Wilkinson (this happened in 1941, but the same story has been repeated in the 1980s).

A man from the sugar company told Slayton he would make thirty dollars a week in the cane fields. He left Tuscaloosa with other recruits in a truck provided by the company at two in the afternoon. They were given their first food the next evening. The following night they got more. The next afternoon, they arrived at Clewiston where they were told that each of them owed the company eight dollars for the ride. In addition, each was charged seventy five cents for a blanket, fifty for a cane knife, and thirty for a file. Mornings they were rounded at three thirty given a small breakfast and taken to the fields at four thirty. At eleven thirty they were given a short break then worked until dark. Slayton was paid a dollar eighty for his first few days then two dollars for a couple of days then a dollar twenty. The water supplied in the fields was dirty. For fresh water the cutters paid the company five cents a gallon. They worked every day of the next several weeks. Wind passed among them.

INTERNATIONAL JOURNAL OF DEVELOPMENT PLANNING LITERATURE

4 QUARTERLY JOURNAL PUBLISHED SINCE 1986

Editor S Bhagwan Dahiya

CALL FOR PAPERS

The International Journal of Development Planning Literature invites research papers from authors for publication in this Journal. The Journal aims at to publish (a) Original Research papers on any aspect of development (b) a comprehensive and balanced review of the recent literature in some subfield of development planning (c) one or more essays giving reactions of generally recognized leading development planners to his (or her) recent professional reading and (d) when appropriate a review article on some particularly outstanding book. Authors should send three copies of their papers to:

that they would be killed if they were caught trying to escape and that if they made it to the road they would be arrested for vagrancy and put into jail. Slayton asked the supervisor if he could leave. The supervisor tried to discourage him. Slayton was bitten on the hand by a snake or a spider and became infected. For four days he asked to see a doctor but was ignored. His hands were swollen and he could not work. Another cutter trying to treat him cut open one of his hands and Slayton was then taken to a doctor. Slayton's sister drove from Tuscaloosa to get him. Slayton asked again if he could leave. The supervisor asked if he planned to leave all this free doctoring behind and then said he could go. Nine other cutters slipped out through one of the fields and joined Slayton and his sister in her car.

This was in 1941. But story after story, down to the 1980s—the last story is datelined 1983—the story remains much the same but for the increase in wage rates except that though the workers are supposed to be paid by the day, actually they are given piece rates, and the untrained US workers get much less than they are promised and are sacked without any notice as soon as a trained Jamaican is available to replace him. Let me end with another quotation from Wilkinson indicating the present state of affairs.

When the cutters leave the bus for the fields in the morning the stars are out. Fog blankets the fields and the headlands, the road ahead and behind and the ditches. It looks like mist rising from the surface of a lake and it looks as if the fields were steaming. It is too early for birds. The only sounds are the ones the cutters make. Sweat rise from their shoulders and backs like vapour from the back of a horse. The pusher shouts. Cut that stubble pile that cane good. Too much stubble. Get that stubble man. Do good work. Cut that top man. It get you warm in a minute. Yeah yeah yeah. As they move down the rows they first become shadows then disappear into the mist.

It is a little surprising that the above situation continues in the US even today, perhaps such labour is cheaper than the use of a combine harvester. Or perhaps a combine harvester cannot be used in the otherwise wet sugar fields. Anyhow, the conditions of coal miners in west Virginia are not much better though they are probably better paid (when they can get work).

I have given a fairly extensive quotation because reading Wilkinson's description one is reminded of the human wreckage of the 19th century Britain immortalised in the works of Dickens. It is for this system that Gorbachev appears to have opted to improve the productivity of labour in the USSR, in place of the Khrushchev type reform of the system attempted in the 1950s. It is for this system that the World Bank and the IMF appear

to be pushing the idea of trade reform in India. The only trouble is that the US—which is supposed to be the bastion of both capitalism and democracy—does not believe in free trade, except in items in which it has a competitive edge. It has a well established policy of allowing selective quotas for sugar imports—and the basis for allocating these quotas is partly political and partly which lobby pays more to the decision-makers—and it has never agreed to free trade in textiles and garments, for which again it has a system of quotas. The same applies to Japanese motor vehicles, and a lot of other products.

Productivity of labour is, hereafter, going to be very difficult to measure because with scientific progress, very soon robots can perform all difficult manual operations, and genetic mutations can alter productivity of the farm in a manner which will totally divorce output from human labour. The Marxian ideal of plenty in regard to material output is likely to be achieved by the capitalist system in the not too-distant future. But has the system found an answer to the problem of distribution of that output? Also, of getting over the problem of exhaustion of the finite (exhaustible) natural resources of this planet? Maybe science can find an answer to that also but it is yet to focus its attention on the problem of the degradation of the environment, the destruction of the ecology in large parts of the world, the sub human condition under which some two thirds (or more) of the world's population lives. It is easy for us to condemn the destruction of rain forests in Brazil, but people in Brazil also must eat, and they need new farmland.

The failure of socialism in eastern Europe can be traced to *bureaucratisation* of the system. The protagonists of capitalism are happy, but unfortunately the Adam Smithian 'invisible hand' which is what the supporters of the system praise is nowhere in evidence today. There is really little or no genuine competition, and increasingly, there is a distancing of production operations from the population at large. And since free movement of labour across countries—and now, unfortunately, even within the country—is now a distant dream, one has to sit down and think how does one provide employment and a minimum income to every adult member of the workforce?

That may not be a problem in a highly developed society with a social security system though the article in the *New Yorker* does not seem to suggest that such is the case. But in India, that is the most important problem (and, regrettably, even

in developed countries like the US, though for a small part of the population). Every citizen of this country has a right to have a home, education, good health, a decent income. It is *this* priority which must inform our policy in the coming years, and not a policy that may have worked to the advantage of some country, somewhere in the world. I need hardly repeat myself on how precisely we can set about achieving the goal that we must set ourselves.

Workers against Privatisation

Mukul

The manner in which the ownership of the UP State Cement Corporation with vast assets has been transferred to the Dalmia Industries and the subsequent firing on workers protesting the move at the Dalla plant may well become the focal point for labour unions to organise against the trend towards privatisation.

THE privatisation of the U P State Cement Corporation with factories at Dalla, Churk and Chunar and the subsequent firing at Dalla on June 2, 1991, have become topics of debate nation-wide. It is perhaps for the first time in the industrial history of independent India that at least a dozen workers were killed and many more seriously injured while protesting against the forcible take over of a government factory by a private industrial concern. A large number of workers and their families have still not returned to their colonies, fearing arrests, government oppression and other suppressive measures. This is one of the reasons why the exact number of workers killed is not yet known.

After the police firing outside Dalla cement factory on June 2, the work at all the three factories have come to a standstill. The workers and officials of Dalla factory are on strike and those of Churk have stopped coming to work. And since the Chunar factory is a supplementary unit of Dalla and Churk, involved with grinding of the products manufactured, the work here has also stopped. The cement factory complexes of Dalla and Churk have virtually become police barracks. Workers' colonies wear a deserted look with locked homes and the constant PAC vigilance has created an atmosphere of fear. The local administration and police have issued warrants for the arrests of a large number of workers. On the other hand, Sanjay Dalmia Industries, which now controls the closed factory, is making all out efforts, including threatening workers and attempting to bribe them with the help of the local police administration, to restart work at the factory. The firing at Dalla, has spurred the workers of the corporation and a joint action committee has been formed of most of the cement workers unions. A new situation of confrontation seems to be developing now.

The U P State Cement Corporation (UPSCCL) is the only state sector company operating large cement plants, in

India. Cement factories are located at Dalla, Churk and Chunar. Dalla and Churk are in the newly constituted district of Sonbhadra and Chunar is in Mirzapur district. The first factory was established at Churk in 1954 and the second at Dalla in 1962. The corporation was formed in 1972 and registered as a public limited company in March. It took over the two state government cement factories at Churk and Dalla. These are composite units based on the obsolete wet process technology. The Kajarhat Chunar cement project (based on new dry process technology) taken up by the corporation after its formation, is a split location plant, having its clinker production kilns at Kajarhat (Dalla) and cement grinding unit of Chunar. Viewed in terms of installed capacity, the corporation is the third largest cement manufacturer in the country after ACC and CCI.

According to official figures, the number of workers in Churk, Dalla and Chunar factories is respectively 1,313, 2,043 and 1,107. But a large number of workers, around 3,000, are on the muster roll or are casuals.

The UPSCCL has incurred heavy losses, of the order of Rs 155 crore *vis-a-vis* an equity of Rs 1 crore during the past seven years. The reasons for this dismal performance have been many but the main one is the very poor utilisation of capacity which in 1990-91 was a mere 30 to 35 per cent. This is against the capacity utilisation ranging from 90 to 110 per cent in new cement plants and the national average being 74 to 78 per cent. The total liability of the corporation on account of repayment of loans and payment of interest to the financial institutions and banks was of the order of Rs 115 crore. Besides, the corporation had net current liabilities of Rs 35 crore, of which the major portion was government dues on account of sales tax, railway freight, power, coal, slag, cement reclamation account etc.

Mirzapur, it must be mentioned here

has abundant mineral resources as well raw materials required for the cement factory—limestone and coal. Limestone, coal and the main raw material in the form of slag (which basically contains iron) are available at a much cheaper rate here than in other regions. There are no problems in the supply of electricity. Similarly there is no dearth of a market for cement.

There are surprisingly, no official facts about the heavy losses incurred by the corporation. In spite of a long history of loss, the U P government has never felt the need to constitute a committee to look into and analyse the various reasons for the loss.

ACCOUNTING FOR LOSSES

The factory at Churk uses only the obsolete wet process technology for the manufacture of cement. Dalla has plants which use both the wet and dry process technology. The wet process not only leads to more consumption of coal, electricity and raw materials thus raising the production cost, but also limits the production capacity. Most cement factories in the country have discarded the obsolete wet process in favour of the dry process technology. Because of numerous technical faults the dry plant in Dalla started in 1984 could never exceed 50 per cent of its rated capacity. Senior scientists and technicians of the factory allege that not even a trial run has been done at maximum capacity. Moreover, in both dry and wet process, the last stage of cement production requires the use of fast cooling system technology. If the cooling system is not efficient, the quality and output of cement is reduced. Cement factories of both Dalla and Churk have inefficient cooling systems.

Similarly, the decision of the corporation to install a wet process technology plant at Dalla under the Kajarhat Chunar cement project and a grinding plant at Chunar, is said to have been unsound. This split location project is such that the raw material prepared at Dalla and Churk is sent to Chunar which is about 75 km and 90 km away from the two places respectively only for the grinding purpose. This increases the production cost greatly and also leads to a number of technological problems. Sources at the factory reveal that during the Congress reign, pressure from local political levels lead to the establishment of the grinding unit at Chunar which otherwise would have been constructed along with Dalla and Churk factories.

Poor management and corruption at the top level are also responsible for the loss. Out of 15 directors on the board, five are nominated by the governor, two by financial institutions and eight are elected by the board/shareholders. None of them are full time functional directors with professional qualification and relevant expertise. For example, one officer of IPS cadre was working as director (marketing) in addition to his wholetime appointment as CMD of U.P. State Minerals Development Corporation. It is also widely alleged that the top level is always dominated by the IAS who have been unskilled and inefficient from the technical point of view and have also been corrupt.

It is significant in this context that labour unions of the corporation, have been highlighting corruption and irregularities of the officials, and have clearly demanded action against some officials. The documents and memoranda of the labour unions also reveal irregularities in the corporation. For example, a project to install a mini cement plant in Dehradun was started and after incurring heavy expenditure, was shelved. No action has been taken against those responsible for the failure of the project. Similarly lakhs of rupees were spent on a proposed central office at Varanasi, which is yet to be opened. There have been numerous other irregularities and clear instances of rampant corruption. An advance payment of Rs 2,80,000 (all of it as commission) was made for the purchase of a wagon tipper at Chunar which cost Rs 14 crore. But even before the tipper was installed, the corporation had started procedures to sell it, because apparently it had no use for the same. Thousands of tons of clinker have been sold illegally to private industries. Cement worth Rs 1 crore was supplied to a private company without any advance payment and lakhs of rupees have been given as commission. There have been large scale irregularities in electricity consumption and payment of electricity bills. Maintenance and repair of the plant machines has been neglected as a result of which there have been a number of industrial accidents. Nor has there been any attempt to replace worn out machines which make for low production. Interestingly, the state government consumes 80 per cent of the production of the corporation, buying it at prices considerably lower than the market price. No attempt has been made by the government to look at these irregularities and anomalies, or bring corrupt officials to book.

PRIVATISATION OF CORPORATION

Workers of the corporation came to know of the privatisation plans only when

the government issued a press release inviting private companies to come forward. Till date there have been no consultations on this issue with the workers, officers or the unions. The state government press release on May 1, 1990 invited desirous entrepreneurs for discussions on privatisation of the corporation. A few proposals came including one from the employees to run the corporation as an employees co-operative as well as offers from central government owned Cement Corporation of India and other private industrialists like ACC, Gujarat Ambuja, Modi Cement and Dalmia Industries. After examining the various proposals the government decided to accept the proposal from Sanjay Dalmia Industries, and an MOU was signed between the state government and Dalmia Industries in February 1991.

The main feature of the MOU are Dalmias will take over the management of the corporation on 'as is where is' basis, the joint venture between state government and Dalmia Industries will be in the ratio of 49:51, 51 per cent shares of the corporation with a face value of Rs 100 per share were offered to the Dalmia Industries and 12 other companies under the management of the Dalmias at an actual price of Rs 75 per share, totalling Rs 25.12 crore. The payment terms by the Dalmia Industries were as under: at the time of signing the agreement Rs 1 crore, after three months Rs 2 crore, after six months Rs 2 crore, the balance amount as mentioned above will be reinvested by the state government in the UPSCC in loans/debentures carrying interest at 12 per cent per annum to be redeemed in five years in equal instalments, whenever the state government wishes to disinvest the balance 49 per cent share in the joint venture, the Dalmias will have the first right to purchase at an agreed price at that time. Further all employees of the UPSCC will be taken over by the joint venture on 'as is where is' basis, the state government will appoint the chairman and three other directors while Dalmia industries will appoint a managing director and four other directors, the Dalmias will run the plant as a cement unit for a minimum period of five years, internal and external auditors of the joint venture will be appointed in consultation with the state government, the joint venture will have sales tax deferment for five years which will be paid in five equal annual instalments after a three year holiday, all liabilities due to the state government agencies, exceeding Rs 2 crore, for a total sum of Rs 25 crore are to be rescheduled with a moratorium of three years followed by repayment in five years carrying interest at 12 per cent per annum, a rebate of 3

per cent will be given for timely payment; contingent liabilities of Rs 1.4 crore to the sales tax department and Rs 11 lakh towards stamp duty shall be waived; all sales tax cases of the past will be dropped, all other contingent liabilities will be paid by the state government; financial institutions and banks having stake in the UPSCC will be requested to provide all facilities of a sick company to the joint venture.

The main physical assets of the corporation are land, building and machines. Firstly, Dalmia Industries gets a plant of installed capacity of 16.80 lakh MT for clinker and 25.60 lakh MT for cement at a total cost of Rs 26.12 crore, which will otherwise cost nearly Rs 500 crore (assuming capital cost Rs 2,000 per MT at current prices). Dalmias gets 13.5 sq km of land estimated at Rs 135 crore at the rate of Rs 100 per square metre. There are 5,000 residential units at Rs 55 crore. There are three limestone mines covering an area of 30 sq km with mining rights for another 40 years. Average production of limestone is 2 lakh MT per month. The joint venture has a long term contract for slag with Bokaro Steels for 20 years from 1984 at prices prevailing in 1984.

Besides these visible assets, there are many invisible assets in the form of concession offered by the government. In this context a study by the economist Dalip S. Swamy is significant. According to this study, the current sales tax is about Rs 35

crore. Assuming that the sales tax remains at the level of Rs 35 crore for two years and then goes up to Rs 40 crore as production increases, the present discounted value of interest benefit of this deferment is estimated at Rs 194.33 crore. Further, "the value of the corporation in visible and invisible assets comes to Rs 421 crore. This amount is made up of Rs 135 crore for land, Rs 55 crore for buildings, Rs 24.83 crore for mining rights, Rs 194.33 crore for sales tax deferment benefit, Rs 7.2 crore for moratorium on liabilities to government agencies, Rs 3.65 crore for interest benefit on instalment payments, Rs 1.40 crore for waiver of sales tax, and Rs 0.11 crore for waiver of stamp duty. It should be emphasised that this is the minimum value of the corporation's assets, because many other assets like machines and furniture are excluded from the calculation and the sales tax deferment benefit is estimated at conservative levels of production. The corporation's total liabilities on account of repayment of interest to the financial institutions and banks is Rs 115 crore. This amount should obviously be deducted from the current market value of assets. Following this procedure, one gets the corporation's net assets value at Rs 306 crore. This is the market value of the UPSCC at which it should have been privatised. But the valuation of the UPSCC's assets is based on the paid up capital (book value) of the corporation, which is shown in the books as Rs 68.28 crore, a sum presumably initially contributed by the state government in 1972. This amount is adjusted downward by 75 per cent to Rs 51.21 crore in view of the depreciation of the corporation's fixed assets. The Dalmia's 51 per cent share is then estimated at Rs 26.12 crore.

It is also significant that a share valuation report was prepared for the company's employees by S. K. Ahuja and Associates, Kanpur, recognised by IDBI and government of India. The value of each share of Rs 100 comes to Rs 288. According to Churk Adhikari Kalyan Samiti various concessions and facilities have been provided to Dalmias at a cost of Rs 55.00 only per share, whereas the value of facilities provided actually come to Rs 270 crore, which would come to about Rs 200 per share. Thus each share of Rs 100 has a market value of Rs 488.00 (Rs 288 + Rs 200).

Soon after the privatisation moves became public labour unions in the corporation—there are nine in all of which AITUC, BMS, HMS, and CITU are prominent—independently started organising protest, distributing a series of pamphlets, posters, and memorandums, and

holding dharnas, demonstrations, etc. Simultaneously they also filed a writ petition against the privatisation move in the Allahabad High Court.

It is interesting to take a look at the order of the court against the privatisation and the response of the government, local administration and Dalmia Industries. The high court gave a stay order on October 16, 1990 stating, "...until further orders, the final implementation of the decision to hand over the factories run by the corporation shall remain stayed during pendency of the writ petition. However, in the meantime other formalities may be completed." But the UP state government under the leadership of Mulayam Singh Yadav was interested in going ahead with privatisation quickly and proceeded to do so. After signing the MoU with Sanjay Dalmia Industries in May 1990, the government even issued orders to induct five nominees of Dalmia Industries on the board of directors of the corporation, one of whom was also to be appointed the managing director. The Allahabad High Court had initiated contempt proceedings against D. K. Mittal, special secretary, ministry of industries, government of UP and against S. C. Gupta, company secretary of the UP State Cement Corporation.

During this time, the officers' association of the company also filed a writ petition challenging the government orders. The high court clubbed together both the writ petitions and the hearing started before a bench comprising chief justice B. P. Jeevan Reddy and justice R. B. Mehrotra on April 30, 1990. The high court obtained the views of the Industrial Development Bank of India, the State Bank of India and the Allahabad Bank as to whether their approvals mandatorily required were taken prior to the settlement. The next hearings were fixed for May 21 and 22. But after the May 21 hearing, further hearing remained suspended due to the assassination of Rajiv Gandhi and the high court went on summer vacation after May 24. In view of the urgency of the case, on May 24 the high court ordered that further hearing would commence on or after July 6 on which date the high court was to reopen.

On May 24, 1991, the high court also issued a clarification which ultimately created the way for government action and the police firing. The court order states:

We do not wish to express any opinion on the merits of the several contentions raised before us today at the hearing of this application. Our limited concern at this stage is that the corporation be allowed to run on proper lines till the disposal of these writ petitions. It is with that view that the following clarifications of the aforesaid interim orders are made:

(1) The registrar of companies, Kanpur shall verify whether transfer of 49 per cent of shares of UP Cement Corporation has been effected in favour of Dalmia Industries or their nominees, as the case may be, as on today, i.e. 24.5.91. On such verification, if he is satisfied that such a transfer has taken place, he shall issue a certificate to that effect both to the government of UP Cement Corporation and Mr. Gupta, senior advocate appearing for the petitioners.

(2) If the certificate is issued by the Registrar of companies affirming transfer of shares as contemplated by clause (i) above, the present board of directors will be allowed to manage the affairs of the corporation pending disposal of these writ petitions and subject to such further orders or directions as may be issued by this court in these matters.

(3) That the employees and officers of the corporation shall co-operate with the present management for a better running of the corporation. They shall act subject to the control and directions of the present board of directors. However, the officers and employees shall not be disturbed or shifted from their respective places of posting held by them as on today.

It remains controversial as to whether the concerned department of the UP government implemented and abided by this clarification of the Allahabad High Court. Many questions and doubts remain.

The assistant registrar of companies, Kanpur, A. W. Ansari, issued a certificate on May 27, 1991 to secretary department of heavy industries, UP, UP State Cement Corporation and Gupta, senior advocate. The language of the certificate in itself is serious. "In view of the above noted facts it is certified that 33,45,720 shares of UP State Cement Corporation, as mentioned above stated to have been transferred in the names of above noted transferees by the Hon'ble governor of UP through D. K. Mittal, secretary, industry department, UP government." (No. 20/05524/PC/955). But after the firing at Dalli, on June 7, 1991, the same assistant registrar wrote a letter to secretary, department of heavy industries, UP and UP State Cement Corporation asking for information in the name of governor about the total number of shares and the number of shares transferred to Dalmia Industries and their nominees, as well as details of the government order regarding share transfer (No. 20-03524/PC/500). It is natural to question the relevance of the letter issued by the assistant registrar on May 27, 1991. It is alleged that due to political and other pressures, the assistant registrar issued a certificate regarding the share transfer without verifying the facts. This allegation is further strengthened by the information that after some days the registrar himself issued a notice to assistant registrar to seek reasons and the basis

for issuing a certificate regarding share transfer

However, Dalmia Industries, the state government and the local administration interpreted a part of the court's decision in their favour and used it to give a concrete shape to privatisation. A conspiracy to go ahead with privatisation to its ultimate end was worked out

FIRING AT DALLA

Dalmia Industries clearly wanted to grab control and capture the management of the corporation before a new government took over in the state and the state government wanted the new management to take control of the corporation as soon as possible. And thus the Dalmia management, the government, the local administration and police together worked in this conspiracy. This was the background for the Dalla firing.

The government and the Dalmia management conveniently, reinterpreted a part of the decision of the court and used this as their armour. For example, agreement of financial arrangement clearly states

15) While UP government has decided to sell 51 per cent shares of the corporation as mentioned above to Dalmia and others, due to pending stay of Allahabad High Court, only 49 per cent shares will be transferred at present. Balance 2 per cent shares will be transferred only after the stay is vacated.

This document is signed by Pravin Kumar, managing director, Dalmia Industries and Ajay Vikram Singh, secretary, UP government. Another letter of joint secretary of UP administration, Alok Tandon, dated February 23, 1991, addressed to the president of Churk factory (No 489 18 13 91) reveals the same interpretation. "According to the view of the court, if 49 per cent of the shares are transferred at present then there will be no disregard of the high court's order, since the nature of the company will remain that of a public company."

On May 29, before the firing at Dalla on June 2, a similar incident had been averted at the cement factories of Churk and Dalla. Then the local administration with a large force invaded both the factories and sealed the cash room. According to district magistrate K P Singh and police superintendent K N D Dwivedi, the officers of the factory had illegally kept the government money of the corporation in the factory, instead of depositing it. With a view to protecting this government money, the case was registered under the Indian Penal Code and hence the move to seal the cash room. But the workers of these factories considered this act to be a mere pretext, with the actual aim being

to occupy the factory. Angered the workers came out on the streets and started protesting outside the factory. But then the initiative of the workers' leaders and the constraint followed by the local administration averted any firing. In reaction to this the workers at Dalla stopped work on May 30.

However, with this attitude of the local administration, police and representatives of the Dalmias, a rumour began to spread among the workers of Dalla and Churk that the work and organisation of the factory would be usurped by force in the near future. The workers began an intensive 'dharna' outside the gates of the factory. The rumours proved correct—on June 2 at 11 00 a.m., the local police with a large force, representatives of the Dalmia group and some outsiders brought by them surrounded the factory, workers were pushed out and the Dalmia management established its control over it. The workers continued with the 'dharna'. News about the incident at Churk reached Dalla and a number of workers on 'dharna' outside the factory swelled with other citizens and students also gathering there in large numbers. A number of UP government officers and the management personnel of the Dalmia group of industries arrived at the factory premises under heavy police security for acquiring physical possession of the factory for the Dalmia. By 3 p.m. around 650-700 workers, students and political activists were on the road in front of the factory on 'dharna' protesting against the forcible occupation and privatisation of the factory. The 'dharna' was peaceful and because of the large numbers of people got converted into a meeting and a protest march inevitably disrupting traffic. About half an hour later, i.e., at about 3 30 p.m., the police suddenly resorted to a lathi-charge without any provocation, notice or without any call to lift the 'dharna'. The lathi charge was almost immediately followed by teargas firing, again without warning. The workers were taken aback by the police attack and started running away.

The firing was first resorted to allegedly by the Dalmia personnel with their private pistols. The police then started firing on the fleeing workers at random. As some stopped to pick up the dead and injured workers the police fired at them from point blank range killing them on the spot. Some of the fleeing workers picked up stones and threw them at the police. The police chased the workers to distant places, into the forest, the hilly ranges in the vicinity and inside the residential colonies firing at random above the waistline all through

hours, i.e., up to 5.30 p.m. It was then that the police along with some anti-socials, hired by the Dalmia management, set fire to several vehicles, public buses and shops and later accused the workers for acts of arson. Curfew was imposed the same night and the next morning. It is alleged that quite a number of dead bodies were taken away by the police and burnt beyond recognition. It was reported that at least 40 persons were killed and about 60 injured. On June 3 and 4, the police forcibly entered the residences of the workers, beat them up severely, misbehaved with the women and looted their properties. A large number of workers, reportedly about 100, had already been arrested and cases were framed against them. The general manager of the Dalla factory, Dharam Vir Khushwaha, was arrested for allegedly supporting the workers against privatisation and charged under various sections and later, under the National Security Act. The other two general managers of Churk and Chunar managed to escape, but the things in their houses been taken into police custody.

The district magistrate of Sonbhadra at Churk, K P Singh and superintendent of police K N D Dwivedi state that they functioned according to strict government orders to get control over the factory. According to district administration, the workers at Dalla had openly revolted on June 2. They had made war-like preparations by blocking the roads with big stones and had planned an armed attack on the police. The workers started burning, attacking and looting property. Only then did the police resort to firing because of which nine workers were killed. As compensation, one lakh rupees would be given to the relatives of each of the dead as well as jobs to one member of each of their families and the injured would be given Rs. 10,000 each.

But a survey of the accident site at Dalla clearly reveals the hollowness of this version of the administration regarding the revolt and the attack. In the whole region, leaving aside one or two big pieces of stones there is no evidence of any blockade. And 'war-like preparations' by the workers in the nearby regions of the factory are practically impossible. Not only the factory workers but other citizens, journalists and political activists at Dalla are unani-

mous in their account of the police oppression that day. The workers are yet to receive even the declared compensation.

Clearly the local administration and the police blindly supported the Dalmias and in the name of obeying government orders made attempts to break the morale of the workers opposing the privatisation of the corporation.

AFTER THE FIRING

The firing at Dalla proved to be a turning point. The incident not only shook the workers and officers of the corporation and forced them to work out new equations in a united manner, it also created a new mobilisation process at Dalla, Churk and Chunar. The labour movement in the whole of eastern Uttar Pradesh saw a new awakening. Questions were now being raised not only about privatisation but also about the firing incident.

After the firing, a joint action committee of all the nine unions of UP Cement Corporation was formed and began the process of uniting the workers. In this region, also known as 'Ujjanchal', the workers of the UP Electricity Board's Obra and Anpara thermal power stations went on a last strike for 24 hours. In all of eastern Uttar Pradesh, at Allahabad, Varanasi, Mirzapur, Obra, Anpara, Pratapgarh, Rohitganj etc. a series of protest demonstrations and marches were held by workers and employees.

The police suppression after the killing of workers in the firing, the general disruption of normal life in the area, etc., has made privatisation an issue in the whole region. And thus various political parties of the region also jointly planned protest programmes and certain common demands emerged out of these protest programmes: (1) An impartial inquiry be conducted regarding the firing at Dalla, (2) The district magistrate and superintendent of police of Sonbhadra district be immediately suspended, (3) Relatives of every dead worker be given Rs two lakh and the injured Rs 50,000 as compensation, (4) All the arrested workers be released immediately and cases against them be withdrawn, (5) The decisions to give the cement corporation to the joint sector be withdrawn, and (6) An intensive inquiry be conducted into the loss and corruption prevalent in UP Cement Corporation and concerned officials be punished. A call for an indefinite industrial strike was given in the Sonbhadra district and the unions at Obra and Anpara thermal power stations also gave a call for indefinite strike from June 24. But the main current of the protest movement preferred to wait for the end of the Mulayam Singh Yadav govern-

ment and the formation of a new one. The workers of the corporation and other protestors felt that they had no hope of justice from the Mulayam government and instead of beating their head against a wall, they should wait for a more responsive government. Thus the programme for indefinite strike was postponed.

In the context of privatisation of UP Cement Corporation, two things regarding the local labour movement are extremely significant. First, the role of the union affiliated to Bharatiya Mazdoor Sangh (BMS) in the corporation. The BMS union (affiliated to BJP) had been regularly highlighting the corruption and irregularities at the corporation and appeared to be against its privatisation. But in the decisive stage of privatisation of the corporation and after the firing at Dalla, the BMS union started supporting the handing over of the corporation to the Dalmias. The union called back its representatives from the joint action committee of workers' unions though two of its representatives defied the decision and continued to work in the committee. The local leaders of BMS at Churk openly state that while government may have the control of the corporation, it should be run by the Dalmias. These leaders have sidelined the questions regarding the procedure of privatisation and the firing incident. And their demands have got limited to giving compensation to dead workers, stoppage of retrenchment, lay off of workers in the private sector and protection of pension/gratuity, etc.

This attitude of BMS has angered the workers, citizens and students of the region and allegations of corruption are flung at it. While the BJP MLA from Robertsganj, Tirth Raj Singh stated in a conversation with me that "the BMS workers' movement should come along with movement against privatisation. But the attitude of BMS leaders is not correct. Action should be taken against them", clearly the local BMS leaders do not agree with this stand. The attitude of the BMS is particularly suspect because the Vishwa Hindu Parishad leader Vishnu Hari Dalmia is known to have family connections with Sanjay Dalmia.

There are a number of interrelated streams in the movement against privatisation. It is true that the fight against privatisation and the firing incident have made the officials of the corporation and labour unions ride on the same boat. An organisation of officers, the 'Churk Cement Officer's Welfare Association' has played a positive role in organising the fight against privatisation of the corporation in the court and regarding disinforma-

tion. But the response of the officers and that of the workers to the privatisation move are vastly different. The workers of the corporation are as much against corrupt officers, their irregularities and luxuries as they are against the UP government and the Dalmia group. They say that it is precisely the misdeeds of these officers which have led to such a situation and they are being made to pay the price for it.

After the formation of BJP government in UP, all eyes have turned to the issue of privatisation of the corporation. The government led by Kalyan Singh has declared that all matters relating to privatisation of public sector enterprises taken by the Mulayam government would be looked into but there is no specific mention of privatisation of the UP State Cement Corporation. On the other hand, the Dalmia management at Churk is openly saying that due to the formation of BJP government, nobody can now touch them. On this basis, an attempt is being made to destroy the unity and confidence of the workers. After the firing at Dalla, the UP workers' unions, the all India workers' unions (CITU, AITUC, BMS, etc.), organisation of public sector unions, etc., have indicated the possibility of seeing this as a test-case and thus might become a focal point for labour unions to organise their protest against privatisation.

A Monumental Reference Work

COMMITTEES AND COMMISSIONS IN INDIA (1947-1973) (In eleven volumes)

by
Virendra Kumar

Rs 2600 per set

The publication provides in chronological order vital information about Committees and Commissions appointed by the Government of India during 1947-73. Information for each Committee and Commission is presented in four parts, namely: Constitution, Appointment, Terms of Reference and Recommendations.

Enigma of ULFA

Kamaroopi

Why has ULFA been able to gather such significant support from a people who have everything to lose and little to gain if the strategic objective of ULFA of Swadhin Asom were ever to be realised, or even pursued in an uncompromising manner?

WHILE it is true that the United Liberation Front of Asom (ULFA) has again and again been able to secure the fulfilment of even the most impossible of its demands by simply holding out unacceptable threats and tellingly demonstrating its ruthless readiness to execute these threats, this by itself cannot explain the failure of the authorities to meet ULFA's challenge. The other side of the determined coerciveness of ULFA is the substantial support it enjoys both in the countryside and in the cities of Assam, especially, though not only, in the Brahmaputra valley. ULFA's social base is not, as has generally been assumed, confined to small sections of the Assamese-speaking people, overwhelmingly upper caste Hindus and Ahoms, though such may have been the case at one time. It now encompasses a much broader spectrum of the 'people of Assam', and not merely of the 'Assamese people'.

The yet to be resolved hostage crisis in Assam is a case in point. By any account, the actions of ULFA should have caused the deepest dismay among the people of the state. Consider the facts. Less than 24 hours after the new government assumed office in Assam, 14 persons are spirited away in a series of co-ordinated actions from Guwahati, Mangaldai, Jorhat, Sibsagar, Nazira and Margherita. Barring the action in Margherita where the Soviet technician employed by Coal India, Sergei Gritchenko, and his companions tried to put up a struggle, every one of these actions is executed without a hitch. After keeping quiet about the action for nearly 48 hours, during which period the captives were all transferred and housed in several safe locations, a series of press statements issued under the signature of ULFA's chief publicity secretary, Siddhartha Phukan, follow, each more uncompromising and threatening than the other, proposing to exchange, in phasewise instalments and over a prolonged period, ULFA's specified number of militants in prison for the hostages. The first phase of this exchange, dictated by ULFA, envisages the release of two hostages, Sergei Gritchenko and the chief geophysicist of the Oil and Natural Gas Commission, Bholanath Jaiswal, both whom were described as

'foreign' technicians, in return for the release of six of its 'specified' militants whose names (and aliases) and the districts they hail from are mentioned. As if there could be any doubts on this score, ULFA also adds that unless its demands are met by the deadline set by the organisation (6 pm of July 9), which would "under no circumstances be extended", the two 'foreign' technicians it is holding as hostages would be killed.

Hoping to score a tactical and propaganda victory over ULFA, Hiteswar Saikia announces, apparently after securing the clearance of the prime minister, a 'general amnesty' which to all appearances (and indeed by definition) is unconditional and which, according to the provisions of the constitution (Articles 161 and 72), cannot anyway be granted by a chief minister. Though the announcement had the predictable face-saving provision that the 'general amnesty' would not cover those militants against whom there were 'serious charges', all the six militants specified by ULFA, every one of whom had several serious charges pending against him, are released well before the deadline set by ULFA.

About five hours after the six specified ULFA militants had been set free from the Guwahati jail, the Guwahati medical college hospital and the Silchar jail, another communication under the signature of Siddhartha Phukan is delivered to newspaper offices. The statement, dated July 7 and delivered on the night of July 9, tersely discloses that the Soviet technician had been killed in an 'encounter' that followed an abortive bid on his part to escape; and that one of ULFA's own soldiers, Bidyut Gohain, was also killed in the incident. As far as ULFA was concerned, that was the end of the matter; and 24 hours later, the organisation releases the ONGC geophysicist, claiming that since the other person it had promised to release had embraced 'a self-provoked death', it had fulfilled its part of the bargain by releasing Jaiswal.

A second proposal, this time offering three hostages in return for the release of 24 'specified' militants; the same conditions, the same threats. The state government once again concedes; and more than

24 hours after the 'specified' militants are set free (the government has to go through the motions of filing applications before the designated courts to secure orders for their 'release on discharge'), the three hostages are set free.

Yet another pause, yet another demand: this time for the release of 'all members and sympathisers' (no names or numbers) of ULFA in return for the release of two hostages by 6 pm of July 26. Unlike on the two previous occasions, this time the deadline is eleven days ahead in the future, later extended by another five days. Even after this demand is met, ULFA will be holding five more hostages (six, if one were to include the driver of the car of S K Tewari, commissioner and secretary, government of Assam, kidnapped from Guwahati) for nearly a month and will be in a position to make further, for the present unforeseeable, demands.

All the while, one is not even clear exactly what ULFA wants, apart from its strategic objective of Swadhin Asom which even ULFA cannot be planning to secure by simply holding some persons as hostages. Indeed, ULFA has not even bothered to address any of its communications to what it sneeringly refers to as 'India government' (it never deigns to mention the government of Assam). Hiteswar Saikia's apparently reasonable appeals to the organisation to hold talks are met with a peremptory declaration that ULFA will 'consider' holding talks with 'India government' if the agenda for such talks has at the top the question of the restoration of the lost sovereignty of the Asom People of Asom, whose unchallenged and sole representative, in ULFA's view, is naturally the organisation itself.

In any other situation, such a sequence of events would have been viewed as simply an intolerable imposition. But the reality in Assam is that at the 'popular' level, especially at the level of the youth and the middle classes, none of the actions of ULFA beginning with the kidnapping is being viewed as especially offensive or gruesome. Indeed, quite the contrary. No doubt there has been some editorial indignation and hand-wringing; but one is sceptical about their impact.

So one goes back to the point made at the outset about the all-encompassing social base of ULFA, and the legitimacy and social sanction that even its most impossible, even cruel, actions have acquired. Fear of reprisal by ULFA might explain some of the passive indifference at the level of the ordinary mass of the people; but fear alone cannot explain the active social legitimacy that these actions have acquired, the elaborate and clever defences in newspaper columns and the 'radical' rationalisations for the kidnapping and murder.

There are two aspects to this social base.

able to establish some roots. The organisation has been able to pull off many daring 'actions' because of the strong network of shelter and support it has been able to build, consequent upon its well-publicised 'constructive' activities and rather more telling interventions as the custodian of the morals of the community in the countryside. This network, for a long limited to some identifiable areas, has been expanding.

Two, these activities, especially 'non-combatant' activities like liaison with the media, communication and propaganda, have been sustained also because of the support ULFA enjoys among crucial sections of the broad middle classes—the professionals, the bureaucracy, especially the state's security apparatus, and the intelligentsia and women. The most remarkable aspect of this support is that none of these as a category or as a class

objective of Swadhin Asom quite simply because they realise only too well not merely the impossibility of achieving that objective even if society were to be prepared to pay immense (and finally quite wasteful) costs, but also the dangerous implications to themselves if Swadhin Asom were ever to be realised, given the geographical, demographic and historical realities.

It is time policy-makers as well as critics (and sympathisers, too) of ULFA addressed themselves to these basic questions, especially why ULFA has been able to gather such significant support from a people who have everything to lose and little to gain if the strategic objective of ULFA were ever to be realised, or even pursued in an uncompromising manner, instead of merely making disapproving noises or blindly supporting the organisation.

MAHARASHTRA

Boom in Teaching-Shops

J V Deshpande

With the rewards of private enterprise in technical education in Maharashtra so blatantly manifest, it was only a matter of time before the same system spread its tentacles into other areas of education as well.

THE extent to which the institutions of higher learning in Maharashtra have been turned into mere profit-making outfits was once again brought out forcefully in the state assembly recently. The state minister for education admitted on the floor of the house that four of the dozens of private engineering colleges opened in the last few years do not have a single student from Maharashtra on their rolls. Each of these colleges is run by either a minister or an influential functionary of the ruling party.

Nor is the position much different in the other private engineering and medical colleges which have mushroomed all over the state ever since the Vasantdada Patil ministry, in the eighties, threw the field of technical education wide open to the influence-peddlers and go-getters on the specious plea that these facilities needed to be expanded rapidly so that local students are not deprived of opportunities for higher education. A few medical colleges were also started about the same time in non-metropolitan areas, ostensibly to benefit rural youth. It is now revealed that in these colleges also, almost all the students are from the major urban areas in the country, including Maharashtra, and even from NRI families. Many of these students are the wards of successful

doctors in the cities.

When these colleges were first opened without any government grant, it was stipulated that 90 per cent of the seats must be given to students on merit, as per the norms of the government. These colleges not only charged high fees (about 10 times the fees charged in government-aided colleges) but also were allowed to hawk the remaining 10 per cent seats to the highest donors. It was expected that this will make up for the initial outlay of the 'promoters' of these institutes. As is now clear, even the fig-leaf of the guidelines of the education department has been discarded by these institutions.

It is naively assumed by many that even if private groups are allowed to open new donation-based colleges, since the courses, terms, examinations are all decided by the university, ultimately they will stand or fall by the standards set by the university. In practice, the situation is far more unpleasant. The structure of universities in Maharashtra is such that almost every new college and its management also acquires at least one vote in the university senate, board of studies and other decision-making bodies. In Poona University, for example, there are only one government-aided engineering college and two medical colleges, against scores of donation-

based, admissions-peddling colleges. One can well imagine how these bodies will go about enforcing educational or academic rectitude. To no one's surprise, both these faculties have been repeatedly rocked by scandals in the past few years in almost all the universities in Maharashtra.

It is also fondly believed by many that anyway higher education is the monopoly of the elitists and why not soak the elites for the benefits they extract from society. The basic fact is that by not expanding the aided facilities for higher education in the last 25 years or more, such education has been effectively turned into a private preserve of the same elites, with hardly any chance for the vast number of first-generation learners to get into it.

With the rewards of private enterprise in technical education so blatantly manifest, it was only a matter of time that the same system spread its tentacles in other directions also. In Maharashtra, already many colleges of business management, computer applications and, more distressingly, teacher education have sprung up on no-grant donation-funding basis, almost all of them under the patronage of some political leader or the other.

In view of the urgent need for rapid expansion of school education, it is hardly necessary to emphasise the need for a widespread and expanding network of institutes of teacher education. But, once again, by withdrawing from it, the state government has left the field wide open to 'educational promoters'. Admittedly, a seat in a BEd college is not as fetching as one in a medical college, but presumably the bulk makes up for the low per-head return in this case. Anyway, there is no dearth of privately-sponsored colleges of education in the state even as there has been no expansion of government-aided colleges for a long time.

What is urgently needed today is a modicum of perspective planning in the field of education. Not only has the government to anticipate job openings in various walks of life in the years to come and tailor the educational strategy accordingly, but it also has to plan for a normal increase in government-aided facilities to cope with the natural increase in the student population, so as not to build up pent-up frustration in youth. Above all, what is urgently needed is a fresh look at the outmoded grant-in-aid code for educational institutes that is being followed. A new grant-in-aid code has to be evolved, which will also streamline the present policy of reserved seats. However, the fact of the matter is that education in the state is being shaped by the very persons and parties who have done well out of the prevailing system. It would be unrealistic to expect any changes for the better so long as this situation continues.

Needle, Thread and Drudgery

Vimal Balasubrahmanyam

There is a very definite difference between promoting traditionally non-commercial crafts for commercial purposes and the Gandhian principle of not allowing machines to deprive professional craftspeople of their means of sustenance.

NO one who has studied in a girl's school run by nuns is likely to have very happy memories of learning needlework. Of course, I'm grateful now, though I hated it then, that the sisters at my school taught me to do cross-stitch, stem-stitch, feather-stitch and satin-stitch, not to mention basic knitting and how to use a sewing machine, because subsequently I've done quite a bit of creative embroidery and utility garment-making for my home and family. But at no point of time would I have jumped at the thought of earning a living by this acquired skill with needle and thread.

Whenever I come across a write-up eulogising some form of traditional embroidery which is said to have immense income-generating and export-earning potential, I squirm at the thought of the large numbers of women who are going to be 'organised' (rounded-up, might be a more accurate phrase) to produce exquisite handicraft items which will be sold at fancy prices but will enable the embroiderers themselves to just about survive.

Fine and intricate embroidery, when done at a moderate pace as a means of self-expression and for the adornment of one's home or for the personal use of one's small family circle, need not be a strain. If one can manage to adopt a Zen attitude to one's work, it could even be a joy. But as a means of livelihood, it is justifiable only if the work can be done at the same comfortable pace as when one does it for one's own pleasure. What's more, payment should, in all fairness, be determined by the time needed for completion, and the degree of skill involved, rather than on a piece-rate basis.

However, if the needleworker is to be paid on such terms, then inevitably the embroidered product will be astronomically priced and could be bought only as a sort of collector's item. In contrast, the piece-rate payment system brings the embroidered item within the buying capacity of a middle-class and rich clientele, foreign tourists and foreign importers. But at whose cost?

The real price in terms of sweated labour, aching backs and ruined eyesight is paid by the needleworkers. For, even to earn a pittance, they would have to work almost round-the-clock, besides fitting in all the other household tasks in between.

Last December, the Kutch Mahila Vikas Sanghathan (KMVS) had organised in

Delhi a display-sale of embroidered quilts produced by women artisans of Kutch. A group of these Kutchi women, many of whom had never stepped out of their villages before, had come all the way to the capital with their wares and an illustrated panel exhibition which told the story of their life and work.

The main theme of their narrative was to show how middlemen corner the major part of the earnings from handicraft. For an embroidered skirt, which might take more than two weeks to complete, the artisan is paid Rs 40. The middleman sells it to a boutique in the big city for Rs 100, earning a 25 per cent profit after deducting raw material cost. The final consumer pays a hefty Rs 400 for the garment, with the boutique owner effortlessly raking in a 300 per cent profit. A woman in one of the panels is shown asking: "Am I a 'majoor' (wage labourer) or a skilled artisan?" In effect she has indeed been reduced to performing wage labour. But if she were to throw away her needle and thread and instead do unskilled work on a construction site, she'd be able to earn the relatively princely daily wage of Rs 18 while now her income barely amounts to Rs 3-4 per day.

A recent study on women in Delhi's garment industry by Vijaya Rukmini Rao and Sabha Husain contains some startling figures. Average daily earnings for cut-work is Rs 6 for an 8-hour day and for crochet it is less than Rs 3. For intricate embroidery which requires more time and skill, average daily earnings amount to less than Rs 5 for a six and a half hour-day, even though the rate is Rs 15 'per piece' (see *Indian Women in Changing Industrial Scenario*, edited by Nirmala Banerjee, Sage, 1991).

The study points out that the industry is not aiming at production of large-scale standardised goods but at the "more exclusive smaller but expensive section of it". For this, embroidery, especially *hand* embroidery, is the special selling point. "In order to execute this labour-intensive task cheaply, the work is put out to home-based women workers." Interestingly, the researchers show that women's earnings from hand embroidery, which has a high market value, is less than that of machine embroiderers who are all men!

Whether it is 'chikan' work in Lucknow, lace-making in Narsapur, or the gorgeous mirror-work done by the women of Kutch, the pattern is the same. True, when volun-

tary agencies step in and organise the needleworkers to become more visible and vocal, and get better prices for their work, the situation may improve. But it seems to be a mistake to look upon this as anything more than an intermediate phase.

Hand embroidery as a means of livelihood cannot be totally freed from the constraints I described earlier. To maintain the health of the needleworker, production ought to be suitably restricted. But then prices would have to be kept exorbitantly high. Which means that only a limited number of buyers could afford the product, and so it can never be a viable 'business'. Surely the long-term goal ought to be the creation of alternative means of employment rather than getting bogged down in a sentimental glorification of ancient handicrafts.

As writers on Indian folk art and craft have pointed out, most of the traditional crafts at which women of different regions are experts have always had a domestic and ritualistic function rather than a commercial one. There is a clear distinction between crafts which are 'professionally' engaged in for a living and those which are symbols and expressions of an ethnic culture and identity. During better times the women of Kutch did their beautiful embroidery mainly to adorn themselves. Successive years of drought, increasing salinity of the soil and other ecological factors have reduced the community to a state of such desperation that the selling of their handicraft is the only option left for survival.

When a large volume of a time-consuming handicraft has to be speedily produced so as to earn some sort of income, however inadequate, not only does it affect the quality of the work, it imposes a terrible physical strain on the needleworkers and cruelly affects their health and eyesight. I don't deny that the KMVS does have a point in stressing the need for the artisans to get a better share in the profit. But the really significant item in its list of objectives is the reference to exploring land/cattle-based activities which will generate alternative sources of income.

Recently the Saturday features page of a national daily carried a glossily illustrated report on the revival of 'kantha', an exquisite form of patchwork embroidery done traditionally by women in Bengal. The article, with very good intentions no doubt, predictably highlights the income-generating scope of this craft and calls for its promotion so as to help rural women. Looking up 'kantha' in a book on folk art, I find among other things the following: "A work of this kind could be completed by one woman in about six months. However, a 'kantha' might be so richly embroidered as to occupy the female members of a family for the space of three generations." No further comment is needed, I'm sure.

Let me acknowledge at this point that

I'm aware that what I'm raising is a vexed question. Even if rapacious middlemen are eliminated it's hard to see how women doing hand embroidery can ever get time-rate payments, even when voluntary agencies, government departments and lovers of handicraft come to their rescue. I've no idea what those who have sincerely devoted their lives to the preservation of traditional embroidery-related crafts and the betterment of the conditions of crafts-women feel about the uncomfortable contradictions inherent in this issue. I know that I'd personally feel very sad if these beautiful crafts and intricate skills were to gradually die out. But then, all countries in the past must have had their own lovely handicrafts which at one time must have had an intimate place in the daily lives of their people. With industrialisation and changes in the methods of production, inevitably handicrafts have declined the world over. If today in India and elsewhere efforts are made to preserve these skills, surely they can be retained and admired only as museum pieces? Or indulged in as leisure-time activities by those who are fortunate enough to enjoy leisure time? What is the justification in clinging to them as a means of generating employment if the livelihood is going to be so exploitative?

There is a very definite difference between promoting traditionally non-commercial crafts for commercial purposes and the Gandhian principle of not allowing machines to deprive professional crafts-persons of their means of sustenance.

Of course, it may be argued, and rightly, that until alternative avenues of employment are created, this is surely better than nothing. True. But the present trend appears to be towards retaining and perpetuating the process rather than replacing it, all because of its export earning potential. As the study on Delhi's garment workers points out, though the garment export industry is subsidised in various ways by the government, the benefits don't reach the needleworkers. What is really being subsidised is 'unstable employment and poor working conditions'.

Tailpiece Curious to find out what the corresponding situation might have been in the west before full industrialisation, I came across an account of the conditions of women in England around the middle of the 19th century which says "In spite of the bad conditions, the factory girl was better-off than the so-called apprentices to the dress-making and allied trades which employed a very great number of women." This was before the invention of the sewing machine and the report describes cases of blindness among girls who sometimes had to execute, at short notice, large orders for 'fashionable mourning'. Sir James Clark, physician to Queen Victoria, is quoted as declaring: "The worst regulated factory is not so destructive of health as the life of a young dress-

maker."

The drudgery of women wielding needle and thread to earn a living appears to be part of a historical process in every country during its stage of industrial transi-

tion. But in our country it appears as if this phase is being deliberately and immovably frozen for large numbers of women, so as to enable the rest to march forward prosperously into the 21st century.

TEA INDUSTRY

Small Growers to Prop up Large Plantations

Sharit K Bhowmik

The Tea Board's formula for increasing area under tea is indeed ironic—it proposes to encourage landless labourers and unemployed youth to take up tea growing in areas on the periphery of large estates under an arrangement which will only benefit the latter.

THE tea industry in India is in a crisis. This is reflected in the abnormal increase in tea prices during the past three years with the prices having doubled in the past year. This situation is a result of the sluggish increase in production which is unable to meet the growing demand in the internal market. Tea exports have been curtailed because any increase here will accelerate the price rise in the domestic market. Exports have thus remained static at around 200 million kg for the last five years. The industry's performance during the Seventh Plan (1985-90) shows that this industry, which is almost exclusively controlled by tea companies owning large plantations, has been unable to meet any of its growth targets.

The rapid increase in domestic consumption underlines the urgency for higher levels of tea production. The Tea Board [1989 2] has assessed that while in 1957 only 36.3 per cent of the total production was consumed in the internal market this proportion increased to 67 per cent by 1987. An estimate made by V N Reddy (*Demand for Tea*, IIM, Calcutta) which has been accepted by Tea Board, shows that the annual increase in domestic consumption since 1984 is between 15 and 16 million kg. The consumption figures for the Seventh Plan period show that the actual annual consumption has been around 20 to 25 million kg higher than estimated. At the same time the anticipated increase in production was well below their targets. The situation therefore is quite gloomy and is likely to remain so unless production increases.

The Tea Board's approach paper on the Eighth Plan however gives quite another picture. While reviewing the achievements of the Seventh Plan it notes that "the production target set was more or less realistic". And that there was "an increasing trend in production". How the Board could come to such a conclusion is a mystery because on the same page of the

report the figures for production show that they are well below the target. The Seventh Plan envisaged an additional production of 140.6 million kg whereas the actual increase has been only 110 million kg. At the same time the envisaged additional production was based on estimates of increase in domestic consumption which were well below the actual consumption during this period.

The Tea Board attributes the failure to meet production targets to "adverse weather conditions" (meaning drought or low rainfall). In other words, production could increase if the weather was favourable. This again is not totally correct because along with good weather the industry also requires healthy bushes for increasing production. Till the end of 1987 [Tea Board 1989A 27] 44 per cent of the area under tea (viz. 1,71,408 ha of the total of 3,90,431 ha) had bushes which had crossed the economic age of 50 years. The industry has clearly shown no inclination to rectify the situation—only 6.3 per cent of the total area (24,568 ha) had new bushes less than five years old (see *EPW*, April 14, 1990).

In spite of these indications the Tea Board seems to believe that the large plantations are the only means of improving production. In the past the Board had spent all its resources in trying to mobilise these plantations to increase production or expand area under tea. Most of its efforts have borne little results. Even with the infusion of liberal doses of public money there has been only marginal increase in production and in the industry's health. The achievements of the Sixth and Seventh Plans show that the schemes for replacement of old bushes and extension of area under tea have achieved less than 30 per cent of their targets. Moreover, during the Seventh Plan, expenditure on items such as tea plantation finance scheme and tea machinery hire purchase scheme which

are utilised only by the large plantations have been higher than the allocated amounts [Tea Board 1989: Annexure 11]. On the other hand the allocation of Rs 20 lakhs as loans for co-operative tea factories (formed by small growers) has remained totally unspent.

SCHEME FOR SMALL GROWERS

One is therefore pleasantly surprised to find in the Draft Eighth Plan that the Board has laid some emphasis on promotion of small growers. It has decided on this scheme because all other attempts to increase area under tea have failed. Attempts to extend tea cultivation in non-traditional areas have not met with much success while in the traditional areas the large plantation do not seem interested in increasing their area. The Board has estimated that "about 40,000 hectares of additional land of which 25,000 hectares in North Indian gardens and 15,000 hectares in South Indian gardens are available for tea planting". It therefore proposes to encourage landless labourers and unemployed youth to take to cultivation of this land. The small growers will be located in the periphery of the large estates. This will enable them to have a tie-up arrangement with the large estates for technical know-how and sale of green leaves. The small grower will be 'adopted' by the nucleus tea estate and this arrangement will continue for at least 10 years.

The holding size of each small grower will vary between the minimum of 1.5 hectares and a maximum of 10.12 hectares. The nucleus tea estate will have to pay each of its adopted grower a subsistence allowance of Rs 400 per month for the first three years (36 months) and will provide technical assistance which the latter must accept. The estate will supply inputs such as planting material, fertilisers, weedicides, pesticides, etc, which will be bought by the grower. The small grower will have to sell his entire produce to the nucleus estate during the period of the agreement at a minimum price of Rs 3.50 per kg.

A tea bush takes around five years to mature though it starts bearing its initial yield of green leaves after three years. The planting costs are spread over the first four years with the major investment in the first year. The Board has estimated the planting costs for one hectare to be Rs 52,000. The small grower will be provided Rs 31,800 by commercial banks with 3 per cent subsidy in the interest rate while the Board will provide a subsidy of Rs 15,000. The grower will have to provide the margin money of Rs 5,200. During the first year Rs 18,000 will be provided as bank loan while the Board will provide a subsidy of Rs 6,500. During the next four years the bank loan will be Rs 4,600 per annum while the subsidy will be Rs 6,000, Rs 1,500 and Rs 1,000

respectively.

The draft plan ostensibly makes an attempt to create a core of small growers to boost tea output. However these growers will mainly help the large estates to produce more rather than emerge as independent producers. In fact on close examination this scheme looks like another ruse to favour the large growers. It will help them increase their output (and of course, their profits) at minimum costs. For instance, for cultivating one hectare of tea land an estate would have to employ at least two full-time workers, apart from the cultivation cost of Rs 52,000. The labour (which includes wages and other subsidies) at the current rate will come to around Rs 900 per month for two workers. This amounts to Rs 32,400 for 36 months. The workers will also need to be covered under the Plantation Labour Act which includes free housing, medical facilities, primary education for their children, etc. Under the new scheme the estate will have to spend only Rs 14,400 for 36 months as the stipend and all other expenses will be borne by the 'small' grower. This paltry investment will enable the nucleus estate to claim the entire produce of the grower for the following seven years.

Apart from being lucrative for the large estates this scheme will also result in exploiting the small grower. The grower is bound to sell his entire crop to the estate at the rate of Rs 3.50 per kg. The current rate for green leaves in West Bengal and Assam is between Rs 5 and Rs 6 per kg and is likely to increase with the rise in tea prices. The rate fixed by the Tea Board is too low but the growers will have to accept it because they will have the right neither to negotiate with other buyers nor to demand a higher price from the nucleus estate. The proposed agreement enables the nucleus tea estate to "purchase green leaf at a minimum price of Rs 3.50 or such enhanced price as may be fixed in consultation with *Tea Board/TRA/UPASI from time to time*" (Clause 4(a)(iv), emphasis added). Of the three organisations mentioned, the Tea Research Association (TRA) is subsidised by the Indian Tea Association while the United Planters Association of South India (UPASI) represents mainly the large growers. Can anyone expect small growers to get a fair price under such a set up?

The crisis in the tea industry can be eased only if new types of production organisations and ownership structures are promoted. The present domination of large estates owned by private sector tea companies has been largely responsible for the state of affairs. Encouragement of small growers will help in extending the area under tea and in boosting production. However, the Tea Board's approach is coloured by its bias towards the large growers. It has propagated the interests of the tea companies, spent public money in rehabilitating them even when most of

these companies have shown little commitment towards development of the industry and its workers. Hence its new plan of encouraging small growers is mainly centred around how they can help the large-scale private sector. Such an approach will help neither the small growers nor the industry.

It is therefore absolutely necessary that small growers be independent of the large growers. The experiences of small growers in the Nilgiri district of Tamil Nadu are very relevant in this regard. This district has nearly 30,000 small growers whose average holding is a little less than one hectare. Till the 1950s small growers there were dependent on the large estates for the sale of their green leaves. The Tea Enquiry Committee of 1958 (Menon Committee) had observed that this type of relationship would not benefit the small growers in the long run. It recommended that in order to be independent of the large growers, small growers should set up co-operative tea factories for processing their green leaves. The district has at present 13 co-operative factories which together have over 10,000 members. The co-operative factories have collectively emerged as the largest tea producers in the district (see *EPW*, August 26, 1989, Review of Agriculture).

The Tea Board's contribution has unfortunately been minimal in the development of co-operative factories in the Nilgiris. It had refused to grant any financial aid or loan for setting up these factories. The earlier factories (those which were formed in the 1960s) had to start with loans from commercial banks at high rates of interest. The later factories got assistance from the National Co-operative Development Council. The Tea Board, on the other hand has not even disbursed the amount sanctioned as loans for co-operative factories. Even in helping individual small growers it has been indifferent. The Board has schemes for providing subsidies to small growers for replantation, pruning and replacement. Only a handful of small growers in the district have been able to get these facilities.

Though the growth of small growers is a necessary step to increase tea production, the Tea Board is hardly the appropriate authority to undertake this venture. It could be given to rural development agencies which would be more sympathetic to the problems of small farmers. At the same time co-operative tea factories must be started in these areas to ensure that the small growers are not exploited by the neighbouring large estates.

Looking Back

A K Banerjee

Raj Thapar's memoirs recapture vividly the atmosphere of Bombay of the immediate post-war years. A personal response.

ALL These Years is the title of Raj Thapar's memoir which has been widely acclaimed. I want to talk about all the years that I knew Raj and Romesh, dearest friends—over 40 years, which is the span of the book.

When I read the book, I felt that Raj was talking to me, and that I was re-living my life. The story begins in June 1945, when Raj got married and came to live in Bombay in Mafatlal Park by the sea as my friend and neighbour. I was just beginning to know her then—I had known Romesh earlier—but she was already beginning to stand out in my estimation. Romesh had a magnetic personality and was much sought after. Raj was quieter but with a mind of her own, and was the humanising influence whenever Romesh was tempted to behave like a bull in a china shop. Once, early in their married life, Romesh flung the breakfast plate away because he did not like the way it was made. Raj could not stop giggling; she thought it funny that a grown-up man should behave like that. Romesh saw the point, felt small and foolish, and never tried that gambit again.

Raj recaptures vividly the atmosphere in Bombay at the time. The devastating war in Europe had ended, but the two atom bombs still waited to be dropped. There was universal relief, and hope of a new world arising out of the ashes of the old. Churchill, at the peak of his fame and power, had decided to go in for immediate general elections on the advice of his trusted and astute friend, Beaverbrook, who had assured him of victory by a majority of at least 100 seats in the House of Commons. But Clementine knew better and had told Lord Moran, Winston's personal physician, that her husband had no idea how the rest of the world lived, never having travelled by bus and having hardly been inside a tube station. As the election results started pouring in from London, we sat glued to the radio and hailed with joy the news of the landslide victory for Labour, from whom we expected much at the time after the lessons of the war. The voter was not ungrateful to Churchill for his war leadership, but did not have faith in his capacity to rebuild a new world.

It was during their brief stay at Mafatlal Park that Raj and Romesh came to know Rajani Palme Dutt, the leading theoretician and intellectual of the British Communist Party, who stayed with them for a month during his first and last 'permitted' visit to India. Two photographs adorned the office desk of Raj and

Romesh—one of Palme Dutt, who had displaced Nehru after the latter had let down the RIN mutineers in February 1946, and the other of Sachin Chaudhuri, founder-editor of the *Economic Weekly* and of its successor, *Economic and Political Weekly*.

With the coming into power of the Labour Party in Britain, the approach of Indian independence became visible and exciting, but was mixed with foreboding over the danger of partition. We 'sleepwalked' into it (as Raj did into Marxism) without realising its grave long-term consequences and that it was a crime against humanity. The original date set for the transfer of power was June 30, 1948 and it would have given us more time to think, but Mountbatten changed all that, having made up his mind in favour of partition even before leaving England. He arrived in India in March 1947 and stampeded the complex transfer of power based on division of territory in a few months. The argument was that civil war would have broken out otherwise; no one had the clarity to foresee that wars between nations are far worse. They thought that friendship would be born overnight out of the ashes of hatred and violence fanned into flames for years. A kind of political madness had seized the country at the time, to allow such a monstrous calamity to take place. 'Over my dead body', both Gandhi and Nehru had said.

So it was with joy and sorrow that all of us celebrated the first independence day in London on August 15, 1947. It was wonderful to feel free at last and be looked upon as equals after years of struggle and sacrifice. How much we owed to the previous generation for giving up so much, their own lives not excluded, for a great cause which inspired them. It is this inspiration which is missing now. Apparently, the cause of building the country from bottom up, on the basis of social justice, does not carry the same inspiration.

When Raj and Romesh were at the crossroads of their life in 1959, *Seminar* came as a saviour to change their destiny. This is the crucial paragraph in the book: "*Seminar* came out looking beautiful. Handling it that evening at the bang-up celebration, I knew it was there to stay, healthy from the start. We had managed every little part of the operation with the minimum of expenses from the start, and that was the secret of survival in India if you wanted to preserve the quality of what you were doing as well as your own

integrity. *Seminar* had made us, in some inexplicable way, suddenly free. We were doing our own thing which depended on nothing but ourselves and this gave us joy which brought purpose and confidence and optimism surging back, everything falling into place, the communist nightmare having fled leaving behind lessons we had learnt, hopefully not to be forgotten."

Seminar is still being run by Raj's daughter, Malvika, and comes out on the dot on the first of every month. It makes us feel the continued presence of Raj and Romesh.

Raj completed this memoir on her deathbed. It was meant to be a legacy for posterity and the last chapter was unfinished. Would she have published it in her lifetime? I do not think so. This could be a point of criticism, but does not affect the outstanding quality of the book which will be read avidly. It is meant to be revealing, thought-provoking, not to answer questions, for that the search must go on. The book begins with the political madness that led to partition, and ends with the political madness that led to Operation Bluestar and the subsequent assassination of Indira Gandhi. We are not yet out of the mad-house.

Raj used to say that not for a moment did she regret having married Romesh. And when she passed away, Romesh had no one to talk to and check his opinions with, so he too passed away in a few months, leaving behind an imperishable legacy, *All These Years*.

London Economic Summit

31

The developing world is losing the initiative in the formulation of its policies—and the views of the Group of Seven will matter more and more in the shaping of its destiny

THE leaders of the seven largest market economies in the world—Britain, Canada, France, Germany, Italy, Japan and the United States—have just concluded their meeting in London. In many ways it was a historic meeting. The leaders met in the after glow of having tackled the Gulf crisis successfully. The summit received Gorbachev as a supplicant, and heard him seek assistance in the Soviet Union's movement towards a market economy. This is the first western economic summit in which united Germany has participated, though with slightly different economic and political concerns.

The G-7 leaders clearly sense that they are on the verge of a new world order and that they must use their immense economic and political power to steer it in the directions they want. But what kind of world do they wish to see emerge? In very blunt terms, they would wish to see:

- a UN Security Council with enhanced powers to intervene militarily, *a la* the Gulf crisis,
 - reduced military capability on the part of the Soviet Union,
 - a demilitarised third world
 - enough political and economic stability in the Soviet Union and eastern Europe, to prevent an exodus of refugees to western Europe and the other rich countries,
 - the spread of market economy and the creation of property rights in all communist countries
 - a third world which is essentially dependent on the G-7, but making enough progress to prevent the spread of poverty and famines and controlling population growth, and
 - more action on environment and better supervision of nuclear safety standards.
- Such are the broad aims of the G-7.

But Gorbachev came to the meeting expecting largesse. His country is undergoing severe economic disruption. Soviet GDP fell by 10 per cent in the first half of 1991. Imports this year are running at nearly half the level of the previous year. Oil output is shrinking. Gorbachev wanted credits and loans. He may be looking for assistance of the order of \$150 billion over the next five to six years. The G-7, however, has been least obliging and there are deep divisions within the group on how much money it can make available.

Germany—which is most interested in

giving aid to the Soviet Union, because it fears refugees and because it stands to gain the most from a prosperous Soviet Union and eastern Europe—is already burdened with an annual bill of nearly \$80 billion in rehabilitating eastern Germany. Japan is sick of being asked to put up money, without at the same time being given a commensurate status at the G-7 table. Two of the traditional surplus countries have little money to give. The US feels that its budget crisis leaves little room for efforts of this kind. Britain is going through a large balance of payments deficit. Overall, little money is forthcoming.

But the G-7 is concerned lest Gorbachev lose face. It is also concerned that a break up of the Soviet Union could be chaotic, not least because of the uncertainty regarding the parcelisation of control over nuclear bombs and facilities. So a deal is struck. There is to be technical assistance of all kinds to prepare the Soviet economy for market processes by granting it an associate status with the IMF and the World Bank to rehabilitate and upgrade oil production (better supply of oil would benefit the industrial countries also, by keeping a downward pressure on oil prices) to convert the defence industry for civilian output, to improve food distribution. The G-7 has also promised further efforts to promote Soviet trade with eastern Europe.

What does this leave the Soviet Union? Gorbachev has committed himself to a market economy and any going back on that will mean a drying up of all western support. The conservatives in the Soviet Union would need to think twice before taking any such action. And as the republics gain autonomy in economic affairs, there is likely to be severe disruption and possible shortages of food. There is a vague hint that food assistance might be forthcoming from the G-7 should conditions deteriorate, but there is nothing firm on the agenda.

The Soviet Union, however, must agree to cut its armaments and it is not a coincidence that agreement has been reached on the START treaty. The technical assistance promised to convert defence industries for civilian output should also enable the G-7 to ascertain how quickly the Soviet military establishment can be wound back.

One thing is clear: the third world can no longer look to the Soviet Union for

support in any dispute with the west.

The G-7 also paid some attention to eastern Europe, as part of its concern over the economic and political stability in that part of the world. It noted that nearly \$31 billion had been mobilised as bilateral aid by the industrialised countries (with nearly 40 per cent of it contributed, according to Germany, by it). And it promised to open up trade opportunities, particularly with the EC, in steel, textiles and agriculture. It foresees special associate relationships between the EC and eastern Europe as part of this process. This raises the possibility that west Europe may throw open trade opportunities to east Europe at the expense of other parts of the world, including the developing countries.

What of the developing world? Its concerns did not seem to figure prominently in the discussions. John Major, when he was the chancellor of exchequer, had proposed in 1990 fairly significant measures for relief on the bilateral official debt of low income countries in Africa and elsewhere. He was hoping to secure G-7 endorsement for this. But apparently Japan and the US were both less than enthusiastic. So a decision has been postponed.

This is not to say that the G-7 has not acted boldly in the past where its interests seemed to be involved. It was able to agree on substantial debt write-offs for Poland and Egypt early this year. Lest the other developing countries should entertain expectations of similar help, the G-7 has now made it clear that the Polish and Egyptian deals should be treated as exceptional.

But the G-7 is concerned about the military capability of the third world and the nuisance this could become. It has also realised that the competition among its own member countries to secure arms sales abets this process. This is not easy to control. Proposals have been made to develop a central registry process under the aegis of the UN to bring the arms trade out into the open. And, clearly, pressure will be put on countries outside the G-7 grouping—China, Brazil, Chile, Israel and South Africa, for example—to fall in line.

There will be pressures on developing countries to cut their military expenditures. Negotiations with the IMF and the World Bank for structural adjustment loans provide an opportunity for the G-7 to press for cuts in military expenditures as part of loan conditionality. While this has not yet become open, clearly these institutions are groping for a technical basis for doing so. The G-7 concern about environment has already become part of conditionality, in future, there will be even more emphasis on it.

But what of the G-7 member-countries' own internal economic management? The

Industrialised countries are going through a recession and unemployment has assumed major proportions. The US is clearly worried and it was known that it wished to see lower interest rates. There is also some concern at the failure to conclude the Uruguay round of trade negotiations. The G-7, however, seems to have made only modest progress in reaching understanding on these matters. It noted that there are increasing signs of economic recovery, and left it at that. On the Uruguay round, there seems to be greater determination to reach agreement; and the G-7 leaders committed themselves to talking to each other should difficulties arise. But by implicitly linking agriculture, the thorniest of issues, to other areas (services,

intellectual property rights) they have managed to deflect attention from it somewhat. It is anybody's guess whether there would now be a breakthrough in the negotiations on agriculture.

The developing countries should increasingly prepare themselves for a world in which their position is marginalised. There will be less sympathy for their problems. They should be prepared to invite foreign investment, liberalise trade and cut military expenditure. Some of that could do good to their economies. But the fact of the matter is that they are losing the initiative in the formulation of their policies—and the views of the G-7 will matter more and more in the shaping of their destinies.

MALAYSIA

Role for Non-Malays in Economy

M G G Pillai

Malaysia's new development plan outlines a significant role for non-Malay communities, while ensuring that the Malays continue to control a third of the economy.

MALAYSIA's new 10-year development plan—the Second Outline Perspective Plan (OPP)—passed by Parliament earlier this month with its emphasis on multiracial involvement for an industrialised society reflects the confidence with which the Malay and 'bumiputra' community view their role. The OPP outlines an important role for the non-Malay communities amidst a continuous push to ensure the Malays and the 'bumiputras' achieved their target of controlling 30 per cent of the economy. Its more liberal outlook of the country's developmental growth comes as Dato' Seri Mahathir's view of an industrialised Malaysia by 2020 takes shape. It reflects changing perspectives in government on the business community, and the growing confidence with which national issues are decided upon. That the Malay community has not reacted against it, as it would have only 10 years ago, reflects the changing mood, and the realisation among them that there is a place for everybody under the Malaysian sun.

This contrasts sharply with the deliberate pressure on non-Malays under the New Economic Policy (NEP), which ended last year, when implementing policies that on paper, could not be faulted. This during the 1969 racial riots, led to flight of capital and a steady migration of those with essential skills to Australia, Canada, Singapore and other countries which was probably a panic reaction. Many migrants now return, partly as the economic recession begins to bite in those countries, especially in Australia, and partly because

of the more enlightened view in Malaysia of the role they could play in the country's development. The civil service and political view had also changed in the meanwhile. There is, for instance, a conscious attempt to persuade Hong Kong and Taiwanese businesses to invest in Malaysia, something that would have been unheard of only a decade ago.

That is clear in the OPP: only a politically and economically confident Malay community can address itself to the problems of the other communities. The OPP aims for development in tandem at all levels of society: high-speed economic growth at one end and social and cultural development at the other. But with the best of intentions, the disparities and difficulties would remain, as they do in the most developed of countries.

In 1989, a year before the NEP was to run its 20-year course, the government appointed a National Economic Consultative to review it and suggest how a new plan could replace it. As it happened, there was no unanimity in its recommendations and the government did not accept all the recommendations. The NECC report has yet to be released, but some of the recommendations have been incorporated in the OPP, and the National Development Plan (NDP), from which the OPP will take its guidance. An indication of how the NDP will fit in would be known when Dato' Seri Mahathir announces the Sixth Five-Year Development Plan next year.

The NEP was initiated in the aftermath of the worst racial riots in Malaysian

history; and it was implemented by racially-committed Malay civil servants. The Chinese community, especially, bore the brunt of official attempts to ensure that the Malay business interests had a niche in the Malaysian economy. It was viewed overseas as an officially-inspired affirmative action programme in favour of the Malay community. The Chinese and the foreign investors saw it as a deliberate attempt to channel the pace of development and business to benefit the Malays. This is not denied.

The underlying basis of the policy then was to ensure that the Malays, who had political power, also had a stake in the economy. This was emphasised from the early days of independence when UMNO, in negotiating a concord with the Chinese and the Indians, it promised citizenship to more than one million citizens in return for bringing Malays into business. But that was not to be. The Malays kept their side of the bargain, but the Chinese business community did not or would not. The continual carping between the two communities within the ruling alliance coalition, often hidden from public view, laid the groundwork for a racial tension which sparked off racial riots on May 13, 1969.

The twin focus of the NEP was to ensure Malay control of 30 per cent of the economy and to reduce poverty levels. In that it succeeded. But despite the carping of the Chinese community, it did well. Not so the Indians, who retained the same 1 per cent of the economy as they had in 1970. The Malay share rose sharply from 2.4 per cent to 20.3 per cent. The Malays have certainly come out on top in this exercise. The other two communities, Chinese and Indian, grossly and criminally mismanaging their business conglomerates. Several key politicians, including the then president and the youth leader of the Malaysian Chinese Association (MCA), went to jail for cheating its members and ran the organisations to the ground; gross mismanagement underlines the troubles at the Malaysian Indian Congress' investment arm, Maika Holdings. The directors, in short, stole or mismanaged the money left in their trust. The Malays did not.

The Malays, therefore, view the situation from a high moral ground. The government looks at every request for help from the Chinese and Indian community, especially in business, with a wary eye, something it perhaps would not do to a similar request from the Malay community. What is perhaps more significant is that in the 20 years of the NEP, it was an axiom of business in Malaysia that no non-Malay succeeded without Malay partners. The Chinese progressed, however one looks at it, with Malay partners.

The Chinese share rose from 33.3 per cent to 44.9 per cent. Other Malaysian groups rose from almost nothing to 0.3 per cent. The gains were at the expense of the foreigner, whose share dropped sharply from 63.3 per cent to 25.1 per cent.

Contentious as the NEP was, its success lay in reducing poverty levels and the confidence it gave the Malay and 'bumiputra' community in business. Under the OPP, the inevitable extremes in wealth will remain, as they do in every other country and society. The policy concentrates on growth through private enterprise, with less and less emphasis on government aid, and a drastic reduction of subsidies. The NEP looked at growth primarily from ensuring that the Malays were given a stake in a massive restructuring exercise, and in active government involvement in industry, aided by heavy subsidies and grants. Tun Razak, the late prime minister, had looked at India's government involvement in business, and the use of policy to rein in business, and accepted it.

But that laid an overly heavy dependence on official handouts or clout by Malay business men when they found themselves outmanoeuvred by their non-Malay, mainly Chinese, partners. Dato' Seri Mahathir is moving the community away from a narrow, parochial outlook. But he could not have succeeded if the Malays had not been comfortable about their political and economic position. In any case, Malaysia could not have survived with the main political group deprived economically.

The OPP, like the NDP, underlines Dato' Seri Mahathir's desire to move into the industrial age and for Malaysia to be among the industrialised countries of the world. Unfortunately, it was thought in haste and in secret and foisted upon a Malaysian public—everyone talks about it, pays lip-service to it, but there is an official reluctance to accept contending views, especially from the opposition. Besides, without major restructuring of the administrative and economic structure, policies can only make cosmetic changes.

That aside, the initial steps have been taken. The move to heavy industry, especially the development of a Malaysian motor car and of a steel industry, have already begun. The initial concerns have given way to a more pragmatic view, even among the critics. There would, inevitably, be more heavy industrial projects. The government figured, rightly, that the Malay community could not move into heavy industry without active coercion and control of heavy industry. That has begun to pay dividends. But it is also equally true that non-Malay support is also needed.

INSTITUTE FOR SOCIAL AND ECONOMIC CHANGE

Nagarbhavi P O : Bangalore 560 072

XI/151/91

Applications are invited for the award of PhD-Fellowships in Economics, Ecology Economics, Education, Political Science/Public Administration, Population Studies, Sociology and Social Service Management. Fellowships will be available to the selected candidates from ICSSR/Institute for Social and Economic Change/Reserve Bank of India

Essential Qualifications:

- a) Master's Degree or equivalent in the relevant discipline with at least 55% marks in the aggregate.
- b) Master's Degree or equivalent in the relevant discipline with at least 50% marks in the aggregate, in case the candidate has passed the National Entrance Test (NET) conducted by the University Grants Commission

For ICSSR/RBI fellowships, a pass in NET conducted by University Grants Commission is also necessary

Age Limit: Normally below 25 years. Age relaxable in the case of SC and ST Candidates.

Amount of Fellowship:

Rs.1,800/- per month for the first two years and Rs 2,100/- per month for the third year. Contingency grant Rs.5,000/- per annum

Prescribed application forms and relevant details can be had from the Registrar in person or by sending DD or a postal order for Rs.10/- together with a self addressed and stamped Rs.2.00 envelope (28 × 11 cms). No PO or DD required for SC/ST candidates; they should send an attested copy of the Caste certificate. Completed applications should reach the Registrar on or before **10TH SEPTEMBER 1991.**

Growth Theories and Development Strategies

Lessons from Indian Experience

Pronab Sen

The objective of this study is two-fold: (a) to re-establish the macro-economic foundations of development strategy; and (b) to reiterate and re-emphasise a conventional, and now largely ignored, wisdom—that policy formulation in developing countries, even for meeting short-run shocks, must be based on an awareness of longer-run consequences.

Outlining the broad contours of the evolution of the Indian economy based on existing literature, the author indicates the organic linkage between the development process, conduct of policies and the nature of the binding constraints on growth. It is from this that an argument for a complete re-evaluation of Indian development policies is developed and an alternative strategy for development proposed.

I Introduction

THE history of economic thought and practice relating to the less developed countries of the world during this latter half of the 20th century can be classified into two distinct and equal segments or, in the words of A. K. Dasgupta, epochs.

The 1950s and 1960s were the era of decolonisation, and the process of transition of the newly emergent nations from passive victims of external exploitation to active arbiters of their own destiny was fertile ground for the emergence of development economics as a field of enquiry in its own right. Development economics branched off in two distinct directions. On one hand there were the microeconomic issues which arose from the institutional differences between developing and industrial economies. On the other hand were the more macroeconomic problems of generating rapid and sustained growth in economies which had only the rudiments of an industrial sector.

Issues of growth and development strategy were central to many of the great debates of this era. The economic histories of already industrialised countries were disinterred and re-examined with much greater analytical rigour than ever before in order to identify the sources of growth. The stages of growth 'take off into self sustained growth', the Kuznetsian U-curve, balanced and unbalanced growth, the dual economy 'heavy vs light industrialisation'—all were products of this incredibly fertile epoch of economic thought.

Hand in hand with the conceptual and empirical evolution of development economics, there were tremendous advances made in growth theory. The rather primitive, though most insightful, growth models of Harrod and Domar were supplemented by a whole host of new models and concepts. The Solow-Swan, Kaldor-Pasinetti and the 'two sector models, the 'turnpike' and optimal control are only a few of the instances. These models to a large extent drew their inspiration from the burning issues of development economics and in turn, provided the theoretical foundations for much of the development strategy literature.

This symbiotic relationship between

development economics and growth theory was most significant in that it led to a more or less constant awareness of medium and long run issues in the formulation of development policies. There were no doubt any number of aberrations arising out of social, political and administrative compulsions, but conceptual myopia was seldom the cause.

The idealism and the concern about global growth that had characterised the 1950s and 1960s all but vanished in the economically more turbulent 1970s and 1980s. The oil price shocks of 1973-74 and 1979-80, the global recession of the early 1980s and the 'debt crisis' of the mid to late 1980s shifted the attention of policy makers from long run strategic issues to very short run fire fighting. In the developed 'north', global idealism was seen to be an unaffordable luxury and battle front terms such as 'economic triage' came into currency.

Academic economics kept pace with this attitudinal shift, with 'growth and development' giving way to 'stabilisation and adjustment' as the catch words for the profession.¹ The shift away from macro dynamics to macro statics led inevitably to a certain pauperisation of development theory. For the most part, the structure of and the analytical techniques used in macro statics were well known, and little new was added. The most significant development in the field was in the area of Computable General Equilibrium' (CGE) models, which more or less displaced planning and optimisation models from the forefront of academic and policy discourses.

On the other hand, the new found emphasis on 'efficiency' gave an added fillip to the micro economics stream of development economics, which had been relatively low profile during the earlier era. This field grew to such good effect that today development is seen more as a process of getting each sectoral parameter and institution right rather than how they fit into the overall scheme of things. There is no doubt that this burst of research on micro economic issues was necessary, and it has contributed considerably to the understanding of the differences between the development experiences of different countries. But sectoral optima should be contingent upon

macro-economic conditions and not the other way around.

The biggest casualty of this era of intellectual retreat on the macro economic front was policy formulation in developing countries. The new challenges thrown up by the turbulence of the period could not be met by the application of new theories and perspectives. As a result these countries were forced to employ orthodox (i.e. DMEC based) short run macroeconomic management policies with very little idea of the longer run consequences.² In this vacuum, the rather doctrinaire policy recommendations of the multilateral aid agencies led by the IMI held sway.

What is perhaps worse, the dominant growth and development prescription available today—the World Bank's structural adjustment' package—seems to be based more on ideology than on any clear and rigorous analysis of developmental processes. The emphasis, or rather almost total reliance on market forces which characterises this approach appears to ignore much of history and all the various distortions present in developing countries which call for at least judicious government interventions. This is perhaps an inevitable consequence of the emerging dominance of micro economic development theory and de-emphasis of macro-economic issues. Since most arguments for government intervention arise out of macro conditions, almost any overtly micro economic approach will invariably require the minimisation of the government's role and expansion of untrammelled market forces, no matter how inappropriate it may be given the imperatives of social and political factors.

The objective of this study then is two-fold: (a) to re-establish the macro-economic foundations of development strategy, and (b) to reiterate and re-emphasise a conventional, and now largely ignored, wisdom—policy formulation in developing countries, even for meeting short run shocks, must be based on an awareness of longer-run consequences. This has become even more imperative now than earlier, since the complexity of growth processes has increased substantially, at least in their theoretical recognition.⁴ Much of what is presented in this paper is well known, but little has been

done to integrate these commonly available insights into a development policy perspective. The primary objectives of this study will be to try and fill this lacuna in its small way

II Constraints to Growth and Development Policy

GROWTH CONSTRAINTS: AN INTRODUCTION

Like most of economics, growth theory is concerned with maximising an objective function (the rate of growth of GDP $g(y)$ in this instance) subject to the limitations placed by certain exogenous constraints. In its simplest and most commonly used form, the growth rate is specified as a function of the rate of capital accumulation or investments

$$g(y) = i/v \quad (1)$$

where i = the investment rate (investment/GDP)

v = incremental capital output ratio (ICOR)

In the earliest growth models it was believed that the primary constraint on accumulation was the availability of savings which was determined by the savings behaviour of the economy. This gave the famous Harrod-Domar warranted growth path

$$g(y) = s/v \quad (2)$$

where s = marginal propensity to save

Initially both ' s ' and ' v ' were treated as parameters so that the maximal attainable growth rate was seen to be outside the control of the policy makers. The policy problem then was to attain and maintain the warranted growth rate, which was complicated by the 'saddle point' nature of the growth path whereby even minor deviations from the path would lead to instability.⁵ It was however quickly realised by development theorists and planners that neither of the arguments could be treated as parameters. Three main lines of generalisation emerged—(a) effect of income distribution on ' s ' (Pasinetti), (b) technological change (Kaldor), and (c) effect of the economic structure on ' s ' and ' v ' (Mahalanobis-Feldman)

Although these developments led to a considerable increase in the sophistication of growth models, the essential problem remained simple—a single constraint. The real importance of these researches lay elsewhere. It was in the recognition that policies could be directed not only towards attaining the maximal growth rate for a parametrically given constraint, but they could also be directed toward relaxing the constraint itself.⁶ There were also the first stirrings of dissatisfaction with the single constraint model. This was most often articulated by applied economists and planners in terms of the 'absorptive capacity' of an economy, or the ability of an economic system to utilise productively the possible investments

The first major complication was introduced by Chenery in his 'Two-Gap' model, which explicitly recognised the role of imports in the creation and effective utilisation of productive capacity. The 'Savings constraint' of the earlier models was therefore supplemented by a 'Foreign Exchange constraint'. As it happened, the full significance of the 'Two-Gap' model was not realised until much later. In the early versions, the classical assumption of a savings constrained investment function continued to be made. This had a serendipitous effect on the relationship between the two constraints. The inflow of foreign exchange in the form of foreign savings (either aid or debt) would augment the availability of both foreign exchange and investible resources. Likewise efforts at relaxing the domestic savings constraint would also tend to relax the foreign exchange constraint. Thus there was apparently no real conflict between the two.

The most valuable contribution of the 'Two-Gap' model was in opening up the closed economy structure of the earlier models. This added an entirely new dimension to development policy and planning. In particular it laid emphasis on the trade off between current production and capacity creation, and its sensitivity to the allocation of imports between capital goods and intermediates. Perhaps equally importantly, it implicitly raised the likelihood of capacity under utilisation which was assumed away in earlier models. In practical terms, it also provided the most compelling justification for development aid and the continuing expansion of the multilateral aid agencies.

This model has been the most durable in so far as its influence on policy recommendations are concerned. This is not the least because it provides the intellectual *raison d'être* for the multilateral aid agencies who are now the dominant purveyors of development advice in the world.⁸ But this is of course not all. This model is, if properly utilised, a very powerful one and sheds light on a number of important policy decisions such as whether to follow an export led strategy or an import substituting one, when and how much to borrow on the international money markets, whether and on what terms to allow foreign direct investments etc. Its place in the tool kit of the development theorists is unquestionable.

The next important conceptual development in this field was the introduction of the 'Agricultural constraint' to growth. This was uniquely an Indian contribution and arose out of the development experiences of the country.⁹ But its application range is very much wider. Unfortunately it came at a time when development and growth theory were already in retreat and, as a result, had much less impact than it deserves.¹⁰ The basic argument of this theory is that in a poor and primarily agricultural country, slow growth of the agricultural sector places a limit on the maximum *non inflationary*

rate of GDP growth which may be very different from the savings- or the foreign exchange-constrained rates. The simplest version of this relationship is as follows:¹¹

$$g(y) = n + [g(a) - n]/L \quad (3)$$

where $g(a)$ = exogenously given growth rate of agriculture

n = growth rate of population

L = income elasticity of demand for agricultural output

Simple though the above expression may be, this theory is of a considerably higher degree of sophistication than its precursors. In the first instance, it recognises that growth and development are not synonymous terms and that development policies have objectives (in this case, inflation) beyond the maximisation of the GDP growth rate. Second, it emphasises the importance of the sectoral break up of developing countries in terms of the relative efficiencies of investment and their amenability to policy influences. Third, and perhaps most importantly, it brings out starkly the interaction between the growth constraints, and the need to be aware not only of the immediately binding constraint, but also the extent of slack available in the others.¹

The 'dual economy' models of Lewis, Jorgensen etc capture only a part of the implications of the agricultural constraint model, and are really the building blocks for it. In order to do full justice to poor, dominantly agricultural economies, the 'wage goods' constraint has to be married to the macro economic issues of income distribution, inflation, balance of payments, etc. which this theory seeks to do.

The latest addition to the family of growth constraints is the 'Fiscal constraint', which has originated in the Latin American Neo-Structuralist school.¹² This constraint is based on the insight that productive utilisation of production capacities requires a corresponding input of certain key infrastructural facilities. In most developing countries, infrastructural investments are and can be carried out almost entirely by the government or the parastatals. If in such a situation the government is unable to raise the necessary resources in a non inflationary manner, either capacity utilisation will fall or fresh private investments will not be made.¹³ In either case, the growth rate of GDP will be adversely affected and may well fall short of the rates permitted by the savings or the foreign exchange constraints.

Like the agricultural constraint, this one too recognises the peculiarities and the imperatives that guide policy making in developing countries. It also brings to the forefront the need for having an active public sector. Market forces clearly cannot be relied upon to provide all the necessary inputs for growth and development. It also explicitly highlights capacity utilisation as an important adjustment variable, which had only been implicit in the earlier models.¹⁴ This model has an important dimension which is missing in all the others—it draws a well

defined distinction between the real and the financial sectors. All the earlier models were in essence real in nature, and discussions of monetary and financial issues were more in the nature of qualifications. It is this dimension that highlights the importance of the type and the recipients of foreign capital inflows—a feature which should have been central to the two-gap models, but was not.

At present, therefore, there are four distinct constraints to growth which have been identified in the literature and have been analysed to a greater or lesser extent. However, these are not all that there is to development strategy formulation. As has been mentioned, there is more to development than merely attaining high rates of GDP growth even on a sustained basis. Each country has a set of minimum socially necessary conditions that economic policy has to address. Inflation has already been mentioned in this context. There can be a number of others. A few which are of relevance to India, for instance, may be mentioned—a minimum rate of employment growth, poverty alleviation, and balanced regional development. Any formulation of development policies has to retain awareness of these conditions and how they limit attainment of feasible growth targets.

CONCEPTUAL ISSUES IN DEVELOPMENT STRATEGY FORMULATION

It should be apparent that the emergence or recognition of additional constraints to growth has rendered simplistic the view that accumulation and efficient use of capital is the sole or even primary basis of growth which underlay virtually all of development planning and policy in the earlier years. While it remains true that sustained growth is impossible without accumulation, there is need to retain awareness of the nature and interrelationship of all the constraints if the sacrifices made in current consumption and well being implied by savings are not to be rendered infructuous.

Of the four growth constraints identified in the previous section, three—namely, foreign exchange, agriculture and fiscal—are considered as 'structural' constraints, in the sense that they originate from rigidities in specific sectors. This is in contrast to the general demand supply indication given by the savings constraint. This distinction between the structural constraints and the savings constraint has a crucial bearing on the conduct of policy.

In a structurally-constrained economy, the very fact that the saving constrained growth rate is greater than the attainable implies that the investment necessary to attain the maximum constrained growth must be less than the *ex ante* savings. This is not a serious problem in centrally planned economies where either consumption or planned investments in long gestation projects can be easily adjusted, but it creates complications in a market or a mixed economy where

private investments are large. Regardless of the nature of the investment demand function, if private investors are not willing to tolerate increasing capacity under-utilisation, *ex-ante* private investment demand is likely to fall considerably short of *ex-ante* savings. Thus a generalised aggregate demand problem arises whereby the actual demand-constrained growth rate falls short of even the structurally-constrained one. Moreover, depending upon the specification of the investment demand function, the system may well become unstable or, at the very least, display large cyclical swings around a low trend growth rate.¹⁶

This problem is precisely analogous to the well known instability problem in growth theory which arises when the Harrodian 'warranted' rate exceeds the 'natural' rate. In such a scenario, public expenditure becomes crucial in order to avoid problems of current demand. The issue is the necessary level of public expenditure. Let the savings-constrained growth rate be approximated by the Harrodian 'warranted' rate as given in equation (3). If the structurally constrained rate is 'g', then 'v g' is the growth in capacity required to maintain the constrained rate. If the private sector left to itself increased capacity at the rate 'i' then the government must spend at a rate of $[v g - i]$ in creating capacity and at $[s - v g - i]$, where 'i' is the marginal propensity to tax, on non-capacity creating expenditure on domestic goods and services in order to avoid aggregate demand problems and the resulting instability.¹⁷

This emphasis on non-capacity creating expenditures by the government is most important and is totally ignored in virtually all of mainstream economics literature.¹⁸ There is a general feeling among most economists and laymen that non investment expenditures of the government are a dead loss to the system and should be held to a minimum. This is simply not correct. Under certain circumstances, over investment can be almost as bad as under-investment, and this must be borne in mind. Therefore, in a situation where the binding constraint to growth is other than the savings constraint, the government not only has to decide on the total level of public expenditures but also its break up into investment and consumption on the grounds of macro economic stability. This also has to be seen against the backdrop of claims on government finances on the grounds of socially necessary objectives.

Monitoring the necessary level of government expenditures, although theoretically determinate, is not easy since the parameters are likely to change over time.¹⁹ However, in a predominantly agricultural economy, a rise in aggregate demand will, *ceteris paribus*, raise the prices of agricultural goods relative to those of other sectors. This of course does not apply to sectors which have administered prices. Thus a convenient rule of thumb for judging the adequacy of public expenditures

is provided by the agricultural commodity terms of trade. So long as this figure, on a trend basis, does not move against agriculture, public expenditure levels may be deemed to be adequate.²⁰

In general, this sort of expansionary government behaviour contains a danger of inflation. If there is a downward rigidity of non-agricultural prices because of mark-up pricing and a ratchet effect in wage formation, an improvement in agricultural terms of trade can come about only through an inflationary process. This, however, is a necessary cost of maintaining growth levels under uncertainty, and should not be a cause for concern unless indexation is so prevalent in the system as to make any inflationary pressure explosive.²¹ In such cases the solution is not to permit the emergence of a demand squeeze based recession, the dangers of which have already been discussed, but to reduce the extent of indexation through political processes. Unfortunately, the standard prescription for inflation are all based on a savings constrained view of the economy. As a result the knee jerk reaction is to prescribe a dose of monetary and fiscal contraction.

When the fiscal constraint is in operation, however, the danger is much more serious. Since by definition the government is unable to raise the required resources for bridging the gap between *ex ante* savings and investments through non inflationary means, monetary expansion is the most likely result. In the short run under normal conditions and with widely dispersed holdings of cash balances, nothing much may happen. If, on the other hand the cash balances are held by a few or if the economy is disturbed by exogenous shocks which lead to a switch in portfolios from money balances to speculative real commodity stocks, an inflationary cycle may be triggered off. In the longer run, however if the fiscal problem is not solved, any adequate and steady rate of growth will inevitably be associated with accelerating inflation.

In addition to the general problem discussed above, there are a number of other differences that arise in policy making under different operative constraints. First, issues of resource generation and allocative efficiency are much less important for structurally constrained economies than for savings constrained ones. The primary objectives of medium and long-run policy making for the former should be to stabilise the constraining sector and then to maximise the growth of the other sectors within the limits set by either the acceptable level of inflation or by the balance of payments as the case may be. If doing so requires that allocative efficiency be sacrificed, it must necessarily be accepted.²²

In this context mention must be made of the large volume of literature that has been developed in recent years on the 'rent seeking' or 'directly unproductive' (DUP) activities that are created by import restrictions in general, and quotas in particular.

The argument is that in such restrictive regimes real productive factors are used not for production but for cornering scarcity rents. This represents a net loss to the economy. It should be remembered, however, that this argument applies only when the resources used in the DUP activity are the constraining factors. For the most part, such resources are capital and not agricultural goods or foreign exchange. Thus the argument applies mostly to savings-constrained economies and not to the structurally-constrained ones—a distinction not drawn by the proponents of this theory, although it is obviously crucial. In the case of the fiscal constraint, it may be argued that tax evasion is a major source of such funds and therefore compounds the problem. However, it seems to be a little far-fetched to claim that tax evasion is resorted to for generating 'slush funds'—the implication is a very peculiar form of the 'Laffer curve' indeed.²⁴

Second, the effects of one-off aid and foreign borrowing are very different under the various constraints. With the savings and the fiscal constraints, foreign resource inflows do not cause output to be higher in the short to medium run, but allow extra capacities to be installed for higher output in later years. With the other two constraints, however, foreign funds can have a more immediate impact by allowing the import of constraining goods, if the resources are so used. These 'windfall' foreign exchange receipts, therefore, cause only step changes in output levels under the agriculture and foreign exchange constraints with very little growth effects, but have the potential for a more sustained growth-raising effect under the savings and the fiscal constraints.

Sustained inflows of aid or debt receipts, on the other hand, have the potential of raising growth rates in all cases. The magnitude of these effects, however, is very different between the different structural constraints. The output response of the economy to additions in import-capacity in any year depends upon the foreign exchange multiplier. With the foreign exchange constraint, imports are required only for the 'non-competitive' forms of imported goods. With the agricultural and the fiscal constraints, however, marginal requirements of agricultural goods or competitive imports of infrastructural capital goods also have to be provided. As a result, the foreign exchange multiplier in any given country and at a given constrained level of output is always less in agriculture- or fiscal-constrained scenarios than in a foreign exchange-constrained one.

Third, domestic income policies which attempt to bring out desired income distributions also have very different effects depending upon the operative constraint. With the savings constraint, if marginal propensity to save is positively related to real income levels, all other considerations apart, greater (lesser) inequality of incomes will *ceteris paribus* result in a higher (lower) rate of growth. In the short run, however, the ef-

fects are asymmetric, in that increased savings may well result in the demand constraint becoming effective such that the level of current output falls, whereas decreased savings will have no output expanding effect since the problem is one of an overall supply constraint. The most likely outcome in such a case will be a deterioration of the balance of payments and a tightening of the foreign exchange constraint.

With the foreign exchange constraint, where the bottleneck is a shortage of producer goods or relative luxuries, both of which are demanded more out of non-wage incomes than wages, a more (less) egalitarian incomes policy will increase (decrease) the constrained growth rate. In case of the agricultural constraint, however, where the bottleneck is in necessities which are primarily wage goods, increased egalitarianism will tend to reduce the rate of growth. The fiscal constraint, unlike the others, places a direct limitation on the conduct of an incomes policy. Since taxes are assumed to be rigid, any fiscal redistribution necessarily implies a reduction in public investments in favour of higher current expenditures. This will almost always lead to a reduction in the growth rate. The problem gets further compounded if the tax system is truly progressive. In such cases, income redistribution will lead to a reduction in tax receipts and hence to a further tightening of the fiscal constraint.

SHORT-RUN POLICY-MAKING IN DEVELOPING COUNTRIES

The points made above relate to the longer-run considerations that must underlie the formulation of any development strategy. A distinction is often drawn between development strategy and short-run policy-making for meeting exogenous shocks. This is wrong. It should be remembered that all economic shocks affect each of the constraints to a greater or lesser extent. The policy response should therefore be based on an awareness of which constraint bites post-shock and the extent of slack available in the others. Proximate indicators may well lead to inoptimal policy responses.

A major source of short-run fluctuations in developing countries is weather-related agricultural failure. In most cases this is a transient shock and does not affect the long-run position of the various constraints in any significant manner. It is therefore unnecessary to take any steps which would lead to irreversible changes in the economic structure. The immediate outcome of such shocks is some degree of inflation. It is, however, important to bear in mind the fact that with an oligopolistic industrial structure, relative price adjustments can take place only with some inflation. Such inflation, therefore, should be viewed not as a disequilibrium, but as an adjustment phase in which relative prices are adjusting to changed supply conditions within a 'competitive' market framework.²⁵

Efforts at curbing such inflation by contractionary means are distinctly counter-productive. In the first instance, it can be achieved only by reducing non-agricultural output—which simply means adding output contraction to output contraction. Moreover, the massive reduction in the income terms of trade of the agricultural sector caused by this may trigger off hardship selling of assets, and consequently lead to an unalterable structural change within the sector. This will almost certainly have longer-run consequences on the position of the various constraints and on the attainment of socially necessary objectives.

The alternatives to contraction are either to impose a wage-price freeze on the non-agricultural sector as a whole, which reduces non-agricultural real incomes at a given output level, or simply to allow inflation to continue and make what adjustments are required. The first option in general will imply a tightening of the savings, fiscal and agricultural constraints, and a relaxation of the foreign exchange one. Thus, other than the political and administrative problems involved, this option is credible only when the foreign exchange constraint is binding and slack is available in the others.

As far as the second option is concerned, the major problem lies in the balance of payments implications. The rise in the domestic price level will *ceteris paribus* lead to increased non-competitiveness of domestic products *vis-a-vis* foreign ones, and thereby to a deterioration of the trade balance. The subsequent price decline which will occur with the recovery of agricultural output does not in itself solve the problem since non-agricultural prices would have settled at a permanently higher level. Financing the increased trade gap by drawing down reserves or by borrowing is a temporary measure which is permitted only if the foreign exchange constraint is non-binding. In all other cases, some form of real effective exchange rate adjustment must be implemented.

The other major source of exogenous shocks is international developments such as the oil price shocks or world recession. If the shock is a transient one, and the foreign exchange constraint is not binding, financing the increased trade gap or minor reallocation of imports is usually sufficient. If, on the other hand, the foreign exchange constraint is binding, some reduction in short-run growth performance is inevitable. This may be achieved by an appropriate reduction in the import-intensive components of government expenditure, such as public investments. It should be noted, however, that in such a situation there is a strong danger of a generalised demand problem arising which will drive down the growth rate to below that warranted by the foreign exchange constraint. Therefore, care must be taken to ensure that the cut-back in import-intensive government expenditure is matched by an increase in domestic

resource-intensive forms of government expenditures²⁶

In the case of more permanent international shocks, which involve a shift not only in the intercept of the foreign exchange constraint function but also in the slope, an entire reappraisal has to be made of the constraints scenario. If the foreign exchange constraint remains non-binding, nothing much needs to be done except for some reallocation of imports for ensuring that the reduction in the slack falls only on non-essential imports and not on essential ones. If, however, the foreign exchange constraint replaces some other as the binding constraint, the entire policy framework will have to be re-evaluated in order to accommodate this new reality. Failure to do so will involve large and totally avoidable costs.

The confusion between the short run and the long run is rampant. Most often it involves treating short term transient changes as if they are permanent. Sometimes, however, it works in the opposite direction as well. A classic example of this is the paradox that has been observed of efforts at increasing urban employment in developing countries actually leading to even greater urban unemployment in the medium to long run. This phenomenon, which has received considerable attention in the development literature, strongly suggests the existence of adjustment mechanisms which are usually not present in developed countries and which argue for an entirely different macro-economics for developing countries. Unfortunately, such an integration of the micro-economic phenomenon with the development strategy framework is as yet not available.

Another such instance relates to the advice that is frequently given to developing countries which have chronic balance of payments problems to allow large inflows of direct foreign investment. Although the motivation is more often than not ideological, the arguments are usually couched in terms of short run positive BOP effects. It can be shown, however, that in developing countries such inflows will almost invariably be associated with a negative BOP effect in the short run.²⁷ Thus if any argument in favour of such a policy is to be advanced, it must be made in long run terms and incorporated into a wider policy framework.

III

Indian Experience

BACKGROUND

The first, and possibly only, comprehensively articulated development strategy for India is to be found in the First and Second Five-Year Plans and in the Industrial Policy Resolution (IPR) of 1956.²⁸ The imperatives of fulfilling the aspirations of the people of the newly-emergent nation state dictated a sharp and decisive break from the colonial economic structure imposed upon

the country in the past. This threw up a challenge to Indian economists and planners, who had little to go on by way of past experience in either India or abroad, to chart the course of development from a poor, agricultural economy to a powerful and self-reliant industrial power.²⁹ The Planning Commission, established in 1950 under the stewardship of P C Mahalanobis, was more than equal to the challenge. The early planning framework established by these pioneers has gone down in the history of economic thought as an outstanding example of vision coupled with technical excellence.

The subsequent economic history of India, on the other hand, shows a relatively dismal record of awareness and creativity in economic management. It illustrates the extent of inertia in Indian planning and policy-making, and its insensitivity to structural issues. It is not as if new challenges did not come up during this period. Indeed, the past three decades of Indian economic history, if properly analysed, presents an interesting case study of how the binding constraints to growth can change in response to not only various exogenous shocks but also to development strategies and short run macro management policies.

The lacuna was elsewhere. It lay in the steady increase in the powers of functional ministries, and the consequent marginalisation of the Planning Commission in economic decision making in the country. As a result, policy making no longer emanated from an overall macro-economic perspective, but got fragmented into sectoral domains. This led to the loss of a long term system wide vision, which precluded not only any substantive course correction but also any recognition of such a need. The fact that incremental short run policy changes can have substantial cumulative effects has not been adequately appreciated. Indian economic history is a testament to this.

It is not within the scope of this paper to provide a detailed exegesis or rigorous analysis of these developments. Therefore, what follows is more in the nature of laying down some of the broad contours of the evolution of the Indian economy based on existing literature. The objective of this historical detour is to indicate the organic linkage between the development process, conduct of policies and the nature of the binding constraints to growth. It is from this that an argument for a complete re-evaluation of Indian development policies is developed and an alternative strategy for development proposed.

NEHRU ERA

At the time that the Planning Commission led by Mahalanobis began formulation of the development strategy for India, growth theory was still in its infancy. It was believed that the only requirement for growth was capital accumulation. The theoretical underpinning for such growth

processes was provided by what is now known as the Harrod-Domar model. It may be recalled that the Harrod-Domar model hinged on three critical parameters—the marginal propensity to save (*s*); the incremental capital-output ratio (*v*), and the rate of growth of population (*n*). These were assumed to be exogenously given and constant for the period of analysis.

It is not surprising therefore that the Indian planners explicitly identified the availability of investible resources or savings as the primary constraint to growth in the Indian context. But they did not stop there. Borrowing from the Soviet experiment, they believed that neither '*s*' nor '*v*' should be treated as exogenously given parameters. This recognition resulted in formal articulation of the so called 'Feldman Mahalanobis' model which stressed the role of heavy industries in increasing the savings rate of the economy.³⁰

The innovativeness of Indian planners did not stop there. Foreign exchange was also perceived to be a serious problem, and it was felt that the pattern of growth should be such that it could be sustained even without large inflows of foreign capital. Although this view was never formalised in a specific model, there is no doubt that the Indian planners had to a very large extent anticipated the 'Two Gap' model that dominated growth theory in the mid 1960s.

But these conceptual innovations were not enough. The ground realities had also to be taken into account. It was recognised that the nature of Indian exportables was such that it would not be possible to increase their output rapidly enough for meeting the import requirements.³¹ It was also believed that the new industries that were to be established would not be able to achieve very much in the way of exports until at least a fair amount of learning by doing experience had been gained.³² Moreover, an overriding consideration of the political cohesion of the young Indian state required that development and growth had to be regionally balanced. This had the implication that pure economic considerations, which are the *sine qua non* of any export oriented strategy, could not necessarily govern the establishment of industries. Thus the strategy of import substitution behind a high protective wall was born.

Given the perception of a binding savings constraint, the development strategy had to be aimed at utilising the available investible resources most productively and in a regionally dispersed manner. In order to ensure that the available resources were not wasted through unnecessary duplication of capacities, an administrative device—industrial licensing—was evolved. The objective of this device was to establish a mechanism by which the sectoral and regional capacity allocations made by the Planning Commission could be effectively implemented and monitored. Further teeth were added by the establishment of the Direc-

torate General of Technical Development (DGTD), which was charged with the function of ensuring that the technologies used in various investments were optimal for the country, not only in terms of the state-of-the-art but also in terms of indigenous availability of the requisite capital goods.

The strategy of heavy industrialisation and the need for regional dispersal could not rely entirely on private sector initiatives. The then-nascent Indian capitalist class had neither the resources to meet the heavy capital costs involved in long gestation projects nor the inclination to invest in uneconomic locations. This, coupled with an ideological desire to have a 'socialist' form of development, led to an emphasis on the role of the public sector in industrial growth.¹¹

Therefore, the development strategy formulated by the Indian planners held together as an integrated system which met the imperatives arising out of not only economics, but also political and social ideology and administrative needs. There is no doubt at all that the strategy worked very well indeed. Given the constraints faced by the economy, an average annual growth of 3.4 per cent was most commendable. Equally importantly, the savings rate of the country increased steadily by about 0.5 percentage points per year, implying a marginal propensity to save of about 19 per cent—which is remarkable by any standard.¹² The rapid diversification and regional spread of the industrial base of the country too was commendable, particularly in view of the limited resources and the narrow infrastructural base.

EMERGENCE OF AGRICULTURAL CONSTRAINT

In the euphoria of these remarkable achievements what was not recognised was the fact that the agricultural sector was growing at a rate (2.6 per cent) only marginally higher than the rate of population growth (2.4 per cent). As a result, while the savings constraint was being relaxed at a steady and a fairly rapid pace, the agricultural constraint to growth was becoming more binding.¹³ In order to sustain whatever agricultural slack that existed in the early-1950s at a GDP growth rate of 3.4 per cent and an income elasticity of demand of about 0.7, the necessary growth rate of the agricultural sector was 3.1 per annum.¹⁴ Thus, the agricultural slack was being eroded at a rate of 0.5 percentage points per year—which is very rapid indeed.

It is fairly clear that the savings constraint was dominated quite quickly by the agricultural constraint. There is no precise estimate of when this happened. In the most detailed and comprehensive study of this issue, Sen (1981) indicates that the agricultural constraint certainly was fully in operation by 1960. There was, however, no major shift in the policy regime as international food aid was fairly liberal until 1965. In the aftermath of the disastrous

famine of 1965-66 and the Indo-Pakistan war of 1965, it was realised that aid could not be relied upon and self-sufficiency in food had to be achieved at all costs. This led to an increased emphasis being placed on agricultural growth and the consequent advent and spread of the 'Green Revolution' in India.

Although the green revolution worked to some extent—the growth rate of agriculture rising to about 2.8 to 3 per cent—it had no significant effect on the rate of growth of the economy. From the agricultural constraint, equation (1), it can again be calculated that with $g(a) = 2.8$ per cent, $n = 2.2$ per cent and $k = 0.5$, the constrained rate of growth of GDP, $g(y) = 3.4$ per cent—roughly the actual growth rate over the period (which was about 3.1 per cent).¹⁷ Thus, by chance or design, the growth performance of the economy during the 1960s was more or less at the constrained level even when the development strategy and policies continued to be determined on the basis of a wrongly perceived savings constraint.

But the strategy should have been changed. A non-binding savings constraint implies a domestic resource slack which can be used for relaxing the binding constraint. The agricultural constraint could have been relaxed by larger imports of foodgrains and by increasing even further the investments in agriculture, particularly those of the longer gestation type. The first would require additional foreign exchange which could be obtained partly from reorienting the import basket (to take advantage of the foreign exchange slack) and partly from increasing exports by instituting a more attractive export incentive system. Although this was done to a small extent, over reliance on the import substituting strategy prevented any major change in the policy framework. As a result, although exports grew, the additional foreign exchange earned continued to be spent primarily on imports of industrial capital goods and intermediates. Thus the agricultural constraint remained binding at a fairly low level of GDP growth.

TURBULENT YEARS

The 1970s were a period of great turbulence not only for the Indian economy, but for the world. The major events of this period were:

- (1) The prolonged agricultural failure of 1970 to 1973
- (2) The Bangladesh war of 1971
- (3) The first oil price shock of 1973-74
- (4) The Emergency of 1975-77
- (5) The first Janata government of 1977-79
- (6) Return of the Congress(I) government in 1979
- (7) Start of the second oil price shock in 1979

Despite all of these, the growth rate of the Indian economy rose to 4.8 per cent during this period. Although this was well above the 'Hindu rate of growth' of 3.4 per cent of the previous two decades, it was well below the

attainable. The real negative effects of the mismatch between the perceived and the actual constraints were brought to the fore in 1973-74, when the economy was subjected to the dual shocks of an agricultural failure and the first oil price shock. This period has been extensively studied in Sen (1986b), Sen (1987) and Sen (1988). The basic argument made in these studies is that the government over-reacted to the shocks and instituted a number of severely contractionary stabilisation measures which had the effect of triggering off substantial income and asset redistributions.¹⁸ These stabilisation policies, which were very much of the orthodox IMF type, were appropriate for a savings constrained economy but not for an agriculturally constrained one.

These distributional changes had a number of major effects. First, consumption shifted towards non agricultural products, thereby lowering the aggregate income elasticity of demand for agricultural goods from 0.5 to 0.29. This combined with a high growth performance of agriculture of 4.1 per cent per annum between 1974 and 1979, would have permitted an agriculturally constrained growth rate of 7.1 per cent on average. Second, the savings rate of the economy rose very sharply indeed from 16 per cent in 1973 to 23 per cent in 1979. This implies that the marginal propensity to save went up from 19 per cent in the late 1960s to about 35 per cent by 1979-80.¹⁹ Such a savings propensity would permit a savings constrained growth rate of about 9 per cent. Foreign exchange too was not a problem, since a fairly liberal aid regime, rapid growth of exports and increasing remittances from Indian workers led to a balance of payments surplus by 1970.

The conclusion is inescapable that the Indian economy during this period was not constrained by any supply side constraint but by demand.²⁰ This should never have happened. The costs borne by the Indian economy in terms of the deterioration of the income distribution were not compensated by the growth that had been made possible. There is no doubt that the rigidity of the licensing system was very largely responsible for the missed growth opportunities of the mid 1970s and for the emergence of the large 'black economy'.²¹ The utility of the licensing regime had been over for some time, and this episode simply highlighted the costs of the anachronism. But this lesson still remains to be learned.

'LIBERALISATION' PHASE

The next landmark was in 1979-80, when the second oil price shock occurred and the world economy went into recession shortly thereafter. It was by now clear that the foreign exchange constraint was in operation. The income redistribution of the 1970s and the consequent sharp fall in the income elasticity of demand for agricultural goods had introduced a large slack in the agricultural constraint which expressed itself in

the form of huge government holdings of agricultural stocks.

Although the government had learned some lessons from the past and correctly diagnosed the dangers, consequently stepping up investments in both the public and the private sectors, the latter did not rise sufficiently.⁴² To a large extent this continued to be due to the fact that the licensing regime still had not adapted to the sudden increase in investible resources. As a result, government expenditures had to increase more than was desirable in order to prevent yet another round of missed opportunities and a demand based recession.

It is interesting to note that despite the oil price shock and the resulting balance of payments difficulties, the government did not resort to contractionary measures. It preferred to finance the deficit. This had an important consequence. The rapid structural transformation that was taking place in the 1970s was arrested and the economy settled down to a new sectoral configuration. In particular, the share of the agricultural sector in GDP, which had declined from 47 per cent in 1970 to a mere 32 per cent in 1979 stabilised at that level. This was accomplished primarily by reversing the secular downward trend in the agricultural terms of trade that had characterised the earlier period.

On the negative side, the rapid increase in the savings rate of the 1970s too was reversed. After reaching a high of 23 per cent in 1979-80, it declined to 20 per cent by 1982-83 and stagnated at that level till 1984-85. This behaviour can also be traced to the stabilisation of the economy in the 1980s. A sudden and regressive change in the income distribution, particularly in the presence of 'permanent income' type consumption behaviour, will drive up the marginal propensity to save (MPS) to abnormal levels in the short run.⁴³ Once the distribution stabilises, the MPS settles down to its long-run value and may even dip for a short period as excess savings are adjusted. Since 1985, the savings rate has started increasing again, although at a slower pace of about 0.35 percentage points per year. This indicates a long-run MPS of 27 per cent—which is considerably higher than the 19 per cent which prevailed during the 1950s and 1960s.

While increases in public investments though excessive, were in the right direction the same cannot be said of the import liberalisation that took place since 1979, and more particularly after 1984. It appears that the gainers from the 1970s redistribution—urban capitalists, bourgeoisie and the emergent industrial and rural middle-classes—demanded a consumption pattern which could not be met without the inflow of imported capital and intermediate goods, which had been restricted earlier.⁴⁴ The liberalisation was an outcome of pressures exerted by these groups and partly of the pressures of the multilateral aid agencies, although the ostensible argument was in

terms of increasing the competitiveness of the Indian economy.

In view of the foreign exchange constraint, the proper reaction would have been to step up export efforts substantially and to come down even harder on unnecessary imports. The effect of the liberalisation was almost the opposite. The import intensity of domestic production, which had more or less remained constant between 1968 and 1980, rose by more than 50 per cent between 1980 and 1989. Import substitution became even more attractive than before with large and entirely unjustified increases in the effective rates of protection, and exports more or less remained where they were.⁴⁵ It has been estimated that the effective protection enjoyed by import-substitutes is more than twice that given to exporters.

This liberalisation, in the context of a foreign exchange constraint, had the effect of not only forcing the economy to borrow in foreign capital markets for financing current consumption, but also of widening the gap between the foreign exchange constraint and the savings constraint. This meant that government expenditures had to go up even higher in order to preserve demand stability. This set off a double helix of public borrowing—on the international markets for the necessary foreign exchange and in the domestic market to finance the burgeoning budgetary gap.

By 1989 the process was complete. In a rigorous analysis of the constraints to growth in the 1980s, Sen and Sen (1990) found that by 1989 the binding constraint to Indian growth was not the foreign exchange one, but the fiscal. It was estimated that if present trends were to be continued the fiscal position would become so acute by 1995 that the maximum supportable non-inflationary growth rate would be only 2.5 per cent. The Gulf war has of course complicated matters to some extent, and the foreign exchange constraint seems to be back in operation. But it should be recognised that the fiscal constraint is not too far off at all, and neither for that matter is the agricultural constraint.⁴⁶ Any easing of the oil situation will almost certainly have the fiscal constraint back in full operation. Development strategy and policy formulation must take this possibility into account if the mistakes of the past are not to be repeated.

IV

Development Strategy for '90s

NEED FOR NEW STRATEGY

It should be clear from the preceding sections that the objective conditions of the Indian economy are very different today from what they were in the mid-1950s. It does not seem reasonable therefore to expect that a strategy which was valid then will continue to be valid now. However, in the intervening three decades there has been no significant change in the strategy and in the

policy regime that supports it. All that has been done is periodic marginal adjustments to certain policy parameters for addressing specific short-run problems. Such patchwork tinkering will no longer suffice. In any case the Indian economy has suffered considerably over the years for the lack of a shift in development perspectives. The situation today is so acute that any delay in altering the development strategy and the supporting policies will have unbearably large adverse consequences.

The single most important point to bear in mind while formulating an alternative development strategy for India is that the savings constraint is not, and has not been for a long time, the dominant constraint. At an estimated marginal propensity to save of 27 per cent and a capacity utilisation-corrected incremental capital-output ratio of 4, the 'warranted' growth rate of the Indian economy is 6.75 per cent per annum, which is substantially higher than the actual.⁴⁷ Thus there is considerable domestic savings slack in the economy. Any development strategy must take this factor into account in order to ensure that distortions are not introduced for reasons which are no longer valid.

IMPLICATIONS OF NON-BINDING SAVINGS CONSTRAINT

The recognition that savings is no longer the binding constraint to the Indian economy has a number of implications. First, policy measures aimed at restricting and directing the use of domestic investible resources in order to prevent duplication of capacities and other forms of wastage are not only unnecessary, but have become counter-productive. They have not only stifled the emergence of internal competition, but have also prevented the economy from taking full advantage of the opportunities that became available. In order to prevent such situations from occurring again, it is imperative that the entire industrial licensing regime be dismantled. There is more than enough savings slack in the economy to absorb fairly substantial 'wastage' of investible resources.⁴⁸ It makes much more sense today to allow the financial institutions to determine investment allocations.

Second, the anti-'luxury' bias and heavy-industrialisation approach designed to increase the savings rate of the economy are of much lesser relevance today. The distributional shifts that took place in the mid-1970s were most unfortunate to say the least. But they are today a *fait-accompli*. It is much more important to ensure that the production structure of the economy is consistent with the demand patterns generated by the existing income distribution and export possibilities. This is achieved better by market forces than by inaccurate demand forecasts. Efforts at imposing a specific consumption pattern are doomed to failure as the experience of the USSR and east Europe

have shown. Increased consumption of 'luxuries' may have a mildly depressive effect on the savings rate in the short run, most of which has already occurred and is now in the past, but much more positive results are likely to arise by drawing black incomes into productive use.

Third, since the growth rate of the economy is constrained by some other constraint, and is well below the 'warranted' rate, the danger of a generalised aggregate demand problem and the resulting instability will always be there. This places an enormous responsibility on the government for not only monitoring the adequacy of aggregate demand, but also for taking corrective action. At present there is no system in place which can undertake this function on a regular basis. Individual administrative ministries do keep track of demand for their specific sectors, but there is no macro-economic evaluation. Such a mechanism has to be evolved if a flexible and sensitive macro policy environment is to exist.

FOREIGN TRADE REGIME

As has been mentioned, it appears that at present the binding constraint is foreign exchange, but the fiscal constraint is very close indeed. There is thus an imperative need to step up exports rapidly, and in such a way that direct fiscal involvement of the government is not required. The first and the most obvious instrument for achieving this objective is exchange rate management. During the 1980s the government had followed a policy of allowing the real effective exchange rate of the rupee to depreciate steadily. This policy will have to be continued in the future as well, at least until the foreign exchange barrier is overcome.

But this is not enough. Governmental decision making is seldom responsive enough to meet the fairly rapid change that are required by market conditions. Moreover, the present lack of linkage between export earnings and import entitlement permits the balance of payment to go out of control. Most important, however, exchange rate adjustment does not change the relative levels of protection enjoyed by exporters and import substitutes. At present Indian exporters get less than half the protection afforded to import substitutes. This must change. One way to overcome all these problems is to effect a wholesale change in the import-export policies such that a direct link is drawn between export activity and imports.

At present the government intermediates between the two activities in the sense that the foreign exchange earned by the exporter is turned over to the government, which in turn makes available the foreign exchange to the importer. Similarly, the government collects tariff revenues from the importer and gives export subsidies to the exporter.²² There is only a small component, the Import Replenishment (REP) scheme, in which the exporter and importer interact

directly. The REPs are tradeable import licences which are issued as a given percentage of export earnings. The REP premium represents the transfer of 'windfall' profits from importers to exporters. Currently imports against REPs are only about 7 per cent of total imports.

This scheme can be easily extended to cover at least 40 per cent of all imports. In the present import basket, roughly 40 per cent is composed of petroleum and petroleum products and edible oils, all on the government account. Imports of other intermediates and private sector capital goods from hard currency areas account again for roughly 40 per cent.²³ It is this component which can be covered by the extended REP scheme. A REP entitlement of 100 per cent of export value coupled with allowing non-governmental imports only against REPs or with special licences will serve the purpose. In order to make the scheme meaningful, access to free foreign exchange by importers has to be restricted; otherwise the premium on the REPs will be virtually non-existent, thereby rendering the incentive component negligible.

It is recognised of course that the above scheme will in effect roll back some of the import liberalisation that has taken place in the past. But in view of the foreign exchange constraint, import liberalisation is a luxury that India can ill afford. It is often claimed that import liberalisation is a necessary step towards achieving production and allocative efficiency improvements. However, with a structural constraint, this factor is not an imperative. More importantly, the experience of other countries clearly shows that import-based competition is not essential for efficiency. Just as good results can be obtained through domestic competition, the internal liberalisation proposed through domestic competition with the licensing system should more than take care of the problem.

Even with these changes, one problem will remain. This involves the deployment of foreign exchange between capacity creation and increased capacity utilisation. The growth rate of GDP can be broken into two components: increase in capacity at constant capacity utilisation, and the effect of increased capacity utilisation. It has been noted in Sen and Sen (1990) that in the present Indian context, with capacity utilisation in the non-agricultural sectors of 86 per cent or less, the latter effect requires less foreign exchange than the former to attain the same rate of GDP growth. This is of course possible only for a limited period of time, but advantage should be taken of it while possible. In order to do so, however, the change in the import-export mechanism outlined above cannot be complete. The government needs to retain enough control to direct the allocation of foreign exchange between capital goods and intermediates as dictated by the macroeconomic requirements of the system. This consideration lends additional support for only a partial implementation of the above proposal as has been suggested.

The complete switch over may be effected when capacity utilisation is sufficiently high. In order to make this choice effectively, the government will have to set up an appropriate monitoring and implementing mechanism. The Planning Commission can possibly take up this role.

REDUCING FISCAL BURDEN

Given the uncertainty regarding the fiscal constraint, immediate steps need to be taken to increase revenues and reorient the pattern of government expenditure. It needs to be stressed again that the wide gap between the saving and the fiscal constraints implies that the availability of investible resources is not the problem, but the government's access to such funds. It would be trite to assert that the government should increase its tax revenue; it would already have done so if the political and administrative climate had permitted. This course does not preclude coming up with more imaginative ways of raising tax revenues, particularly from direct taxes.

A more meaningful approach would be to look for alternative methods of not only raising funds, but also of passing up part of the fiscal burden on to the private sector, which has the necessary resources. In this context, the import-export scheme outlined above will contribute, hopefully, to a substantial extent. It not only reduces the government's revenue account liabilities in terms of export subsidies, but the increased import capacity that will be permitted by larger export earnings should help generate more revenues by way of import duties. In addition, the import-export system has characterised production controls should give way to uniform standards as a major source of revenue. This represents a much more flexible and no-idea-based approach to capacity creation.

On the expenditure side, it is clear that in the Indian context, effective utilisation of existing capacities and hence the investment behaviour of the private sector operate through and are inhibited by structural development. The clear-cut essential that the government withdraws from non-infrastructure investment and concentrates its resources on rapidly building up infrastructure facilities, the private sector can also be involved to the extent possible for taking some of the burden off. There is enough administrative experience with operating administered prices to ensure that such involvement does not lead to undue concentration of economic power.

This will, of course, have an effect on the expansion of the PSUs. However, it is to be noted that the economic development function of the PSU can be more effectively executed by improving the infrastructural attributes of backward areas. The growth of the PSU should therefore be determined more by considerations of resource availability and monopoly control than by ideological considerations. Even the control

of monopoly powers is better served by determining an optimal ratio between public and private sector capacities than by reserving areas purely for public sector investments

POVERTY AND EMPLOYMENT

Apart from the technical issues involved in maximising growth under the operative constraint, any development strategy must address the minimum socially necessary objectives. In the Indian context there are at least two which are of great urgency—poverty alleviation and a growth rate of employment of at least 2.8 per cent per annum.⁴¹ The two are of course intimately linked and have to be discussed together.

By and large, poverty in India is a rural phenomenon, although the incidence of urban poverty is very much in evidence. The most striking feature of the employment pattern in India in the last decade is that the agricultural sector, which traditionally absorbed the largest number of workers, has shown virtually zero growth in employment. The roots of this problem can be traced back to the distributional changes of the 1970s. There is clear evidence that during the 1974-1979 period, substantial asset (land) redistribution occurred from the small and marginal farmers and tenants towards middle peasants and the landlord/trader class.⁴² This 'kulakisation' of Indian agriculture has had a number of implications.

First, it has led to the emergence and consolidation of capitalist farming in India. As a result, the substitution of capital and other industrially-produced inputs in place of labour is well on its way. It is this factor which is probably responsible for the almost zero employment elasticity of this sector over the last few years. The process has been given an added boost by the subsidisation, both implicit and explicit, of these non labour inputs by the government. This has led not only to the substitution behaviour, but also to the increasing fiscal burden on the government.

Second, the growing political power of the large/middle farmers has expressed itself in the form of the agricultural price support system becoming more credible in the sense that the procurement price is now very close to the farm gate price.⁴³ This has led to a situation where the benefits to the surplus producing farmers has increased at the cost of all net purchasers of food, such as the marginal farmers and landless labour—the real poverty groups in the rural areas.⁴⁴ The other effect has been that the price support system provides a safety net to private speculative holdings of real agricultural stocks. It is little wonder then that private stocks of agricultural goods, which had virtually disappeared by the late 1970s, have again gone up in recent years.

In addition, the cost formula used today for determining the procurement price has a very large industrial input content. This has introduced a direct link from non-agricultural to agricultural prices and a

degree of indexation which did not exist earlier. The possibility of sustained inflation, and its well known implications for the poor, has thus been enhanced and will continue to become more so over time as the reliance on non-farm inputs spreads.

Third, the inability or unwillingness of the agricultural sector to absorb more labour has forced the government to rapidly increase its rural non-agricultural employment schemes. This has resulted in a huge burden on the public exchequer, which is becoming increasingly difficult to accommodate in the current fiscal-constrained scenario.

Much of these developments has possibly arisen out of some valuable conventional wisdom being ignored or overlooked. In the 1960s, a large and very persuasive literature had come up on the issue of land-holding size and productivity, where it was convincingly demonstrated that the two were inversely related. It was also shown that the employment-to land ratio was inversely related to the size of the holdings. Therefore, the nation would have been much better served if the land ceiling laws that exist on the books had been invoked after the rural asset redistributions of the 1970s. It would have required much less fiscal involvement of the government, in terms of agricultural subsidies, rural employment schemes and finances locked into huge agricultural stocks, for getting at least comparable agricultural output growth. In any case, it is not too late even now.

The other dimension of the employment problem is the lack of jobs being created in the organised industrial sector despite a rapid growth in output.⁴⁵ Indeed, in recent years this sector has shown negative employment growth. This implies that the shift from relatively labour intensive to capital intensive technologies in this sector is not confined to new units, but that retro fitting of existing capacities is also taking place. On the other hand, the unorganised sector has shown fairly rapid and sustained growth in employment. The conclusion drawn from this differential behaviour is that there should be deliberate propagation of the unorganised sector through government policies such as reservations and subsidies.

The above conclusion does not necessarily follow. It should be realised that the substantial differences in wages and wage formation between the two sectors, which led to this observed difference in employment behaviour, are primarily the result of government policies and legislations. It appears that the over protection of organised sector labour and the under-protection of the rest has led to the creation of a dualistic economy even within the urban sector itself. As it happens, organised labour is protected not only by the strength of its trade unions, but also by a host of legislations. Unorganised labour, on the other hand, has neither. It would seem logical to have less legislations protecting organised labour and more protecting the unorganised. Thus, a much more sensible system would be to have a common, and somewhat lower, level of protection for

all labour which would be consistent with the country's resource endowments, such that technology choices would be based on rational economic considerations rather than on grossly distorted wage rates.

Notes

- 1 Indeed today 'growth theory' is considered to be a 'dead' subject and research students are encouraged to stay away from it.
- 2 Oddly enough, the only new developmental perspective to emerge during this era—the 'Dutch disease'—was applicable only to the newly-rich oil exporting countries. The oil-importing developing countries, who were affected most adversely, were by and large ignored.
- 3 DMEC stands for 'developed market economy countries' in the new jargon.
- 4 The reality of growth and development is probably not much more complicated than before, but theoretical recognition of additional complications emphasises the need for even greater care in policy formulation if past mistakes are not to be repeated.
- 5 This problem arises when the 'natural' growth rate (determined by the growth rate of the labour force) is below the 'warranted' growth rate.
- 6 Interestingly, the expansion of the role of policies also led to the recognition of trade offs. For instance, when Mahalanobis identified the relationship between the lack of capital goods production and low domestic savings, it was also realised that a capital goods sector would lead to an increase in v (see Chakravarty, 1989).
- 7 This arises directly from the national accounts identity which equates the balance of payments position with the saving-investment gap.
- 8 In the 1950s and 1960s there were a number of academically based organisations which gave relatively unbiased advice on development strategy and policies, such as the Harvard Group.
- 9 Although the agricultural constraint has been implicit in much of the development literature in India for quite some time, its most formal and rigorous expression is in Sen (1981).
- 10 The lack of impact of this theory was as much in India as it was internationally. Otherwise things may have been very different in India and a number of African countries during the 1970s and 1980s.
- 11 This expression is similar to the one used by Kalecki for characterising the consumption goods sector of mixed economies.
- 12 For instance, suppose the agricultural constraint is sought to be relaxed by imports of agricultural goods, the immediate effect would be to make the foreign exchange constraint more stringent. In addition, the terms of trade effects of easier availability of agricultural goods would undoubtedly affect income distribution and thereby demand patterns. This would have the effect of shifting all three constraints through changes in s , E and the marginal propensity to import. It is not at all obvious what the final outcome would be.
- 13 See Bacha (1988) and Taylor (1988) for details. Some hints of this are also to be found in the Indian literature.
- 14 This behaviour is referred to as the

- 'crowding-in' phenomenon, as opposed to the 'crowding-out' hypothesis proposed in the monetarist counter-revolution literature.
- 5 Capacity under-utilisation is inherent in both the foreign exchange and agricultural constraint models as the natural adjustment mechanism, but has not been used as explicitly as in the fiscal constraint models.
 - 6 Whether the process is completely unstable or shows cyclicity depends upon whether the savings rate falls faster or slower than the investment rate with decreases in real output.
 - 7 The case of the 'fiscal' constraint is a little more complicated since 'i' will become a function of government investments.
 - 8 The nearest one comes to such a recognition is the treatment of non-productive investments and *pollutch* in Rakshit.
 - 9 See note 12.
 - 10 Some corrections would of course have to be made for the effects of world inflation, exchange rate changes and changes in the interest rate.
 - 11 The Latin American hyper-inflation stories have this sort of a problem at their root. See Sunkel (1960) and Cardoso (1981).
 - 12 This may be one possible explanation of the vertical Phillip's curve which has been the corner-stone of the monetarist attack on Keynesianism. This explanation, however, has not been discussed in the literature, and it has little to do with either monetarism or rational expectations. In fact, the solution to this problem is a structural one.
 - 13 It may be argued, as is apparently done by Little, Scitovsky and Scott and implicitly by Bhagwati and Srinivasan (1975), that an increase in allocative efficiency through a more liberal trade policy would lead to a sufficiently high growth of exports so that the structural constraint barriers may be crossed and the savings constrained rate attained. For this to happen, however, a rather extreme form of export optimism has to obtain. A more likely outcome of such efforts is that the economy will grow at a rate lower than the structurally-constrained one, and with a much larger requirement of foreign investible resources during the adjustment phase, which may be prolonged.
 - 14 In this case it has to be argued that a reduction in trade barriers, such as the import duty, will lead to increased tax collection from other sources.
 - 15 It is being assumed of course that destabilising commodity speculation does not occur. If it does, necessary steps will have to be taken.
 - 16 Note that such an increase is permitted by the fact that the fiscal constraint is assumed not to bite.
 - 17 See Sen (1990) for details.
 - 18 The initial attempts at developing such a perspective was through the formation of the National Planning Committee by the Indian National Congress in 1938.
 - 19 The post-revolution USSR was the only available model for study and emulation.
 - 20 The long-run viability of the heavy industrialisation strategy, despite its leading to an increase in 'v' in the medium run, gained theoretical legitimacy from the 'turn-pike' analysis of the 1960s.
 - 21 The bulk of Indian exports were primary goods whose output, unlike that of industrial goods, could be expanded only slowly.
 - 22 The 'infant industry' argument had already been developed by then.
 - 23 Pandit Nehru strongly believed that "... defects are not due to industrialism as such but to the capitalistic system which is based on the exploitation of others..." [Quoted in *PPST Bulletin*, May 1983.]
 - 24 This figure for the mps can be calculated from the following formula:

$$mps = \frac{\Delta y}{y} + \frac{\Delta \text{aps}}{\Delta y}$$
 where y = real national income.
 The same figure of 19 per cent has also been estimated by Krishnamurthy and Saibaba (1981) and Madhur (1984).
 - 25 The agricultural constraint is defined with respect to the maximum *non-inflationary* GDP growth rate permitted by the growth rate of the agricultural sector.
 - 26 This figure may be calculated from equation (3) by putting $g(y) = 0.034$; $n = 0.024$; $E = 0.7$; and solving for $g(a)$.
 - 27 The fall in E from 0.7 in the mid-1950s to 0.5 in 1970 was due to the normal operation of the Engel curve for agricultural goods.
 - 28 The details of these redistributions and the causal factors are given in Sen (1986b).
 - 29 The latter period figure of 35 per cent has been computed in Sen (1987).
 - 30 The emergence of the demand constraint during the mid-1970s is supported by the fact that the terms of trade moved against agriculture more or less steadily over the period 1974 to 1981.
 - 31 The rapid growth of private savings in the 1970s was faced with a situation where adequate investment opportunities were not available in the productive sectors of the economy. The surplus resources leaked into the black sectors, and set off a speculative bubble which continued to attract resources well into the 1980s because of the high prospective capital gains. See Sen (1977).
 - 32 By 1980-81 the investment rate was up to 24 per cent as compared to 18 per cent in 1970-71 and remained more or less steady at that level. More importantly, the share of the government and the parastatals in total investments rose from 38 per cent in 1980-81 to 47 per cent in 1988-89.
 - 33 The existence of permanent income type behaviour in the Indian economy has been confirmed by Madhur (1984).
 - 34 This point has also been mentioned in Chakravarty (1989).
 - 35 The liberalisation of imports took place only at the level of capital goods and intermediates and not for finished goods. As a result, the effective protection on inputs declined whereas that on finished products went up substantially.
 - 36 In the present situation, with the agricultural growth rate $g(a)$ at 2.8 per cent, population growth (n) at 2.1 per cent and E at 0.29, the maximum sustainable rate of growth of GDP which will preserve the existing agricultural slack is 4.5 per cent per annum. Any $g(y)$ above this figure will erode the slack and make the agricultural constraint more binding. This assumes that the regressive income distribution changes that occurred in the 1970s will not be reversed and the poverty alleviation programmes, such as the Integrated Rural Development Programme (IRDP) and the Jawahar Rojgar Yojana (JRY), will have no effect. If they do, the value of E will certainly rise and push down the sustainable value of $g(y)$.
 - 37 This figure has been computed on the basis of the well known Harrod-Domar equation for the warranted growth rate:

$$g(y) = s/v$$
 where: s = marginal propensity to save; v = IC/OR .
 - 38 It is not as if such wastage is not taking place today, as the figures on industrial sickness indicate. The point is that the licensing mechanism prevents new capacities from coming in when and where required.
 - 39 It should be noted that the Duty Drawback (DD) and a component of the Cash Compensatory Support (CCS) are, not really export subsidies since they merely reimburse to the exporter taxes and duties already paid.
 - 40 The remaining 20 per cent is capital goods on government account and non-oil imports from the rupee payment areas (RPA).
 - 41 Although this choice was implicit in the 'Two-Gap' model, and Indian planners have been aware of it for some time, it has not found any explicit reflection in the Indian planning process. With the foreign exchange constraint binding, this seems to be the most important function of the planning system today.
 - 42 An extension of the Essential Commodities Act and a strengthening of the Bureau of Industrial Costs and Prices (BICP) should be sufficient for this purpose.
 - 43 This is the minimum rate of employment growth which will hold the current unemployment rate steady.
 - 44 See Sen (1986b) for details.
 - 45 Earlier the procurement price used to be substantially below the farm-gate price in normal years. The two actually came close only in bumper years, which was the objective of the support-price system.
 - 46 This would not be so bad if the public distribution system (PDS) had a wide coverage in rural areas. But this is not the

Colonial Capitalism and Agrarian Social Structure

Palestine: A Case Study

Nahla Abdo

While the dialectical relationship of domination and subordination can be attributed to all social formations experiencing capitalist development through a colonial power, the Palestinian experience remains historically specific. The economic subordination of the indigenous Palestinian working classes to the European capitalist economy formed only one aspect of the developing economic structure; the other aspect was the exclusion of the indigenous working classes from the dominant capitalist economy and the ruination of their 'natural' economy resulting in the expropriation of their lands. In addition the Zionist racist-nationalistic policies prevented them from having access to their land even as wage labourers. It was this apparently contradictory relationship of exploitation/exclusion which characterised the Zionist colonial movement in Palestine.

WHILE Marxists generally agree that in order for capitalism to predominate agriculture both the forces and relations of production must change and acquire capitalistic features, they differ in terms of the emphasis they place on the components of the capitalist mode of production. One approach, found particularly within the discipline of economics, places a special emphasis on the level of development attained by the forces of production [Bagchi, 1982, Szentes, 1976]. Political economists on the other hand insist that the capitalist mode of production is composed of a totality of relations and forces of production. In this view, attention is drawn to the importance of production relations in indicating the character of the mode of production [Lenin, 1960, Murrey and Post, 1983, Patnaik, 1983].

Both camps agree that certain changes must occur in order for capitalism to predominate in agricultural production. These are (1) capital investment in agriculture, (2) mechanisation of agricultural production, (3) development of intensive agriculture, (4) production of commercial and industrial crops, (5) consequent replacement of small scale agricultural production with large-scale industrial production, and finally, hired or wage labour must be the main source of surplus value in capitalist agriculture [Lenin, 1960, 1979, Kautsky, 1976, Patnaik, 1983, Saleh, 1979].

Changes within Palestine's agricultural economy strongly suggest that capitalism was rapidly replacing pre capitalist forms of agricultural production. This tendency, it will be shown, was prevalent in varying degrees in all forms of agricultural production. Within the European Jewish economy capitalism was not only characteristic of the private settlements but was also a significant force within the economy of the agricultural co-operatives. In fact, the kibbutz, as will be shown in this paper, was itself an integral part of the capitalist mode of production.

The literature which presents the kibbutz as a 'socialist' or 'communist' form of production, it will be demonstrated, is the result of an ideological stand on the part of its

authors rather than any objective scientific approach. The kibbutz, it will be argued, was a much more complex phenomenon. Similar to the Histadrut—discussed elsewhere—the kibbutz symbolised the core of contradictions and antagonisms embedded in the Zionist colonial movement [Abdo 1989]. The dilemma which will be addressed in this regard concerns the important political question (why the kibbutz) and the economic antithesis of this question, i.e., the economic inefficiency of this form of labour organisation.

Here again, it will be emphasised that the government role in advancing capitalist production was crucial. This role which took the form of economic, political, and legal assistance to the developing European Jewish capitalist economy hastened the contradictions between the indigenous rural economy and the Zionist settler one. In the process, the European (Jewish) economy was developing and expanding while the indigenous Palestinian economy was being destroyed. The social and economic burden which fell on the indigenous Palestinian producers as a result of capitalist development of agriculture will also be stressed in this paper.

CAPITALIST INVESTMENT IN AGRICULTURE

One of the main characteristics of European Jewish agriculture during the British period was the investment of capital. The influx of capital from actual settlers, intended settlers (some of whom never settled in Palestine) and other sources was tremendous during this period. Between 1919-1937 about 90-95 million Palestinian lira (i.e., equivalent to 30-95 million English pounds) generated in Europe were invested in Palestine's Jewish economy. Of this amount, PL 10-12 million were used for public purposes by institutions and individuals and PL 80-85 million were invested by private corporations in private enterprises [Himadeh, 1937 228]. About half of this capital, estimated at PL 44 million, was

brought during 1919-1933, while the other half was brought in a period of just four years, between 1933-1937 [Himadeh, 1937 229].

Furthermore, an enquiry by the Jewish Agency revealed that between 1926 and 1932, 553 Jewish families who immigrated to Palestine brought with them over PL 20,000,000, an average of PL 3,763 per family. This capital was invested as follows: 42 per cent in citrus cultivation, 21 per cent in citrus and other economic branches, 17 per cent in building and 5 per cent in commerce.¹ The investment of large sums of capital in agriculture was particularly evident during the 1930s. For example, between 1932-35, about 29,000 liras were spent on agricultural production. Of this 21 per cent was invested in citrus.² Over 63 per cent of this capital was brought by 15,410 settlers, each of whom brought more than one 1,000 liras with him.³

Between 1933-38, 20,681 Jewish immigrants brought with them a total of PL 21,441,000. Less than 5 per cent of these settlers had between PL 250-500 each while the rest had over 1,000 liras each.⁴ The largest single investor throughout this period was the Rothschild family which invested more than PL 15 million in agriculture as well as an estimated 30 million in industrial and other enterprises.

The importation of capital during the 1930s was a political priority for the Zionist authorities in Palestine. Investments from all sources were encouraged during this period, even if such a source was politically, morally and ideologically in enmity with certain (socialist) Jewish ideals. A case in point commonly quoted by critical writers relates to the agreement struck in 1933 between the Zionist authorities in Palestine and the Nazi government of Germany which resulted in the transfer of millions of pounds to Palestine.

According to the deal the German authorities agreed to the transfer of capital in the form of cash, German technology and other merchandise to 'transfer companies' established in Palestine for this purpose.

[Gozansky, 1986: 106; Sa'ed, 1985: 115]. In one year only, 1933, about 106 million German marks (equivalent to 5.5 million Palestinian lira) in cash and merchandise were transferred from Germany to Palestine [Gozansky, 1986: 106]. In addition, between 1934 and 1937 machinery and merchandise worth over 77 million German marks were also brought to Palestine from Germany [Sa'ed, 1985: 115]. This deal made one Jewish writer comment:

The 'transfer agreement' which was struck between the Zionist organisation and the Nazi government under Hitler was the gravest national treason committed by the Zionist movement. In this deal the Zionist leaders proved that they prefer colonialism over all other moral considerations [Gozansky, 1986: 106].

Without referring to this particular incident, one Lebanese Marxist observed the following:

The Zionist movement is nothing but the exploitation, for the profit of Jewish capitalists linked to the aims of imperialism in the Arab East, of the feelings of a people that has gone through a great deal. The Zionists have traded the unhappiness of their people for a commercial undertaking and a colonialist platform.⁵

Yet, as further discussion will show, the exploitative aspect of Zionist colonialism was not confined to economic basis only. Harsher forms of exploitation expressed in the displacement and uprooting of the indigenous population were also sought. For the time being, it is the significance of the influx of European (Jewish) capital on the Palestinian rural economy which will be dealt with.

The large sums of money brought to Palestine had great significance on the Palestinian economy, both relatively speaking as well as in absolute terms. One must be reminded here that these large sums of money were brought to a peasant economy which by the early 1930s was found to be severely impoverished and largely destroyed. Elsewhere, I have shown that the average monthly net income of an ordinary 'fallah', during the 1920s, barely exceeded two three Palestinian liras [Abdo 1989]. In contrast however, individual settlers brought with them over 1,000 Palestinian lira each.

The gap between the wealth of the settlers and that of the ordinary indigenous 'fallaheen' was even greater in the mid 1930s. Village reports during this period indicate that many villages were almost totally bankrupt, to cite one example, that of the village of Dhahiriya. In 1934, as a measure to enforce taxes on this village, the government imposed a collective punishment and ordered the village to pay an amount of 3,000 liras.

Responding to the government order one villager was quoted saying: "I ven if government decides to sell the village complete with all its 1,000 families it will not be able to squeeze 3,000 liras from us."⁶

Moreover, in absolute terms these sums of

money meant a great deal for the development of the Jewish economy. Most of the money was concentrated in developing a relatively small area of land. According to the 1945/46 Survey of Palestine, out of a total agricultural area of 17,31,000 dunams under Jewish ownership in 1944, only 7,16,750d or 41 per cent of the land was actually settled. The remaining 10,14,550d or 59 per cent was put on reserve for future settlement.⁷

In addition, the purchasing power and the productive manner in which this capital was used greatly strengthened the development of Jewish agricultural settlements. Besides the investment in specific commercial products, such as citrus, grapes and other vegetables and fruits, large sums of money were also used in advancing agriculture on scientific and technological bases.

SCIENCE AND TECHNOLOGY IN AGRICULTURE

Scientific research centres, experimental stations, demonstration plots and agricultural schools were but one aspect of the capitalist investment in agriculture. One major achievement in this respect was the establishment of a grand experimental station in Tel Aviv in 1922. Other extension stations were also founded in various settlements. Built with an estimated 85,000 Palestinian lira, the Tel Aviv station became the centre of agricultural instruction for all Jewish settlements. In 1930, the station was staffed by 40 scientists, had three laboratories, seven field divisions and nine district instructors to cover all settlements.⁸ Agricultural schools and research centres were also established in various Jewish settlements. Besides the well known Mikveh Yisrael (an agriculture school and research centre) which by 1929 was catering to over 160 students, the Jewish Agency with the support of the government established five additional agricultural schools.⁹

In contrast, by the early 1930s, the Palestinian rural population which formed over 90 per cent of the total had access to only one agricultural school providing space for less than 40 students per year.¹⁰ Research centres and scientific expertise including chemists and analysts were also provided by the Hebrew University and the Technion, now Israel's largest technical institute.¹¹ The application of technology and science, it must be added, was not solely the fruit of Jewish capital and human resources. A great deal of assistance was in fact provided by the British colonial government.

The role played by government in advancing agriculture was evident at virtually all levels. At the legal level with an eye to encouraging commercial production, the government advanced laws which exempted all demonstration plots (whether erected on Jewish land or on so called state land) from taxes.¹² Of particular significance in this context was the role the department of agriculture assumed in promoting capitalist

agriculture. Established in 1929 and directed by a Jewish agricultural expert, the department was almost exclusively put under the services of Jewish settlements. Government investment in the department in a two-year period of 1929 and 1930 amounted to P1 153,767.¹³

The department of agriculture was not an independent body. In fact, as one British analyst noticed, the department was a mere extension of some Jewish scientific centres and mainly the Hebrew University.¹⁴

While there is no evidence to show that the department made any significant contribution, financial or otherwise, to the indigenous population there is ample evidence to demonstrate its contribution to the Jewish agricultural settlements. Worth noting here is the assistance provided by the department to the Tel-Aviv experimental station. Thus, in a secret dispatch by the British secretary of state for the colonies to the high commissioner of Palestine in 1933, it was revealed that the department planned to spend P1 3,000 a year for a period of five years "to the Jewish Agency's experimental station and the establishment of a government citrus demonstration grove." The same dispatch also stated that "the director of agriculture suggested that the Jewish Agency contribute P1 49,000 and government spend P1 70,000 to be completed within five years for agricultural development."¹⁵

It is interesting to note that neither the government itself, represented by the high commissioner, nor Israeli official authors saw government as biased or one-sided in its agrarian policy. To the contrary, Israeli writers widely believed that if government were not neutral, it was in favour of indigenous Palestinian agriculturists.¹⁶ In fact, as the following two examples show, high government officials firmly believed that their position was even handed and that what in government view was good for promoting modern (capitalist) agriculture was also good for all the economy.

In 1928, for example, after an investigation into the economic conditions of the 'fallaheen' in the Northern District, Harding, the district director suggested that government advance a loan of P1 50,000 as relief to the 'fallaheen'. However, one year later, in 1929, it was reported that the government agreed to a loan of just P1 20,000 and that the loan be divided among both Jewish and indigenous Palestinian agriculturists. As a result the loan was divided as follows: P1 15,000 paid to the 'fallaheen' in kind wheat and barley were bought by government and distributed to the 'fallaheen' and P1 5,000 paid in cash to the Jewish agriculturists.¹⁷

In 1930, after the publication of various reports which demanded that the government do something to help the dispossessed 'fallaheen', the high commissioner of Palestine arranged a meeting with representatives of Jewish and Arab agriculturists to lecture them on what was called "the government role in advancing agriculture in

Palestine. In this meeting the high commissioner provided an empirical example of how the government intended to allocate a grant to "all Palestinian agriculturists". Of the grant, estimated at 20,000 Palestinian lira, 10,000 in cash were handed to 'Jewish representatives' as follows: PL 4,500 to Mikveh Yisrael; PL 2,000 to trade schools in Jerusalem; PL 1,500 to schools for handicraft in Jerusalem; PL 1,250 to the agricultural school in Ben Shemen settlement and PL 750 to the professional school of the Jewish Federation of Labour. The 'Arab representatives', who did not receive a penny, were told that the government would provide villages with barley and wheat.

In both cases, imported North African wheat and barley were purchased. Wheat was bought for 15,500 mils per ton while barley was bought for 10,000 mils per ton. During the same period, however, local wheat and barley were disposed of at an average of 6,000 mils per ton for wheat and 3,000 mils per ton for barley. In other words, had the 'fallaheen' been given the money in cash, they could have obtained more than double the amount of wheat and more than three times the amount of barley offered by the government.¹⁸

As a measure to further subsidise and expand Jewish agriculture, the government extended its tax exemption laws to include the imports of all machinery free of duty. Capital and the colonial state worked together in developing Jewish settlements and revolutionising their forces of production. An impressive achievement of the alliance of capital and legal facilities was demonstrated in the rapid development of mechanisation. For example, in 1922 all Jewish settlements combined had only 33 tractors and no combines. Yet, by the end of the 1920s, all cereal production which characterised the co-operatives was dependant upon tractors and combines. In 1939, a Jewish Agency survey showed that there were over 237 tractors and 80 combines in use in the settlements [Gozansky, 1986: 146].

Equally impressive was the introduction of irrigation schemes during this period. In 1922 an estimated 2,867 dunams were under irrigation, but by 1930 this land expanded to 21,348 dunams, an increase of more than 1,000 per cent, 58,162d in 1941 and reaching 79,850d by 1944.¹⁹ Capital and technological change in agriculture caused a dramatic change in the nature of production. Specialisation and large-scale production based on intensive methods were at the core of this development.

AGRICULTURAL SPECIALISATION

Specialisation in agriculture, which means producing commodities for exchange value, is considered by Marxists as a significant step in transforming agriculture into industry. The concept of agricultural industry must be differentiated from industrial production proper. This difference was described by Lenin as follows:

From the very nature of agriculture its conversion into commodity production occurs in a particular manner, unlike the corresponding process in industry. Manufacturing industry splits into separate, completely independent branches, each devoted exclusively to the manufacture of one product or part of a product. Agriculture on the other hand does not split into completely separate branches, but merely specialises in producing, in one instance, one market product, in another, another market product, the other agricultural aspects being adapted to this principal (i.e. market) product [Lenin, 1977: 267].

Industry in this sense can be attributed to all Jewish settlements both the private and the co-operatives. While the private settlements were predominantly specialised in producing citrus and grapes, the co-operative farms were quickly becoming industrialised as well. Vegetables, fruits, and dairy products were increasingly the predominant agricultural products in these settlements.

Dairy and poultry production in the co-operatives was particularly significant. From 1922-1936 the number of cows reared annually rose from 750 to 8,040. In 1944 due to improved fodder and the introduction of new breeding techniques, the number of cows reached 16,040. An equally impressive growth was also recorded with regard to poultry; from 6,800 heads of poultry in 1922 to 1,75,500 in 1936 and 3,02,400 in 1944.²⁰

The application of capital and machinery in agriculture speeded up the process of industrialised agriculture resulting in a gradual but sweeping take-over of extensive small-scale production by production on large-scale.²¹ What characterises large-scale production is not the size of the land put under a certain crop, but, rather, the form of use of that particular crop.

One must differentiate here between large-scale production and specialised agriculture. For, although in both cases crops are produced for the market, the two phenomena are not the same. Agricultural specialisation, for example, can be found in pre-capitalist forms of production. In contrast, large scale production is specific to the capitalist mode of production.

In small-scale production, usually characteristic of peasant economies, crops are produced primarily as use-values to be consumed by the direct producers. Within the Palestinian context, for example, most cultivable land until the 1930s was under cereal production. Although this does not imply that other commercial crops were absent, it nevertheless indicates that small-scale pre-capitalist forms of production were characteristic of the 'fallah' economy.

The emergence and development of large-scale production, namely, vegetables and fruits during the 1930s and 1940s began to gradually take the place of cereal production. One indication of this process is shown in terms of the decline in the size of land under cereal and the growth of that under commercial crops (Table 1).

While the area under cereal cultivation

was constantly in decline (Table 1), from 65,35,031d in 1935 to 42,35,053d in 1944, that is, a decline of about 35 per cent, both areas under vegetable and fruit cultivation were simultaneously expanding. Between 1935 and 1944 the area under vegetable cultivation increased by 1,75,954d or about 148 per cent, and that under fruits increased by 215,005d or 124 per cent. Yet, the most significant feature in the process of transforming small-scale agriculture into large-scale production is in the amount of exchange value acquired from each product.

In 1941-42 for example, a survey of 8,793 Jewish private farms showed that despite the fact that they occupied relatively a very small area, the overwhelming majority of these farms employed intensive techniques and produced commercial crops. Table 2 demonstrates how small farms were utilised for large-scale production.

Except for category 4, 'extensive farming' (Table 2) where crops like wheat and barley were produced largely for the farmers' own consumption, all other farms surveyed here, estimated at 7,770 farms or 86 per cent of all farms, were highly industrialised, hiring family and outside labour and producing commercial crops for the market [Gozansky, 1986: 145].

Under large-scale commercial production, the productivity of the land is measured by the value of produce per unit [abu-Rjeili, 1970; Kautsky, 1976; Lenin, 1977]. The general trend in Palestinian agriculture since

TABLE 1: AREA UNDER CEREAL, VEGETABLES AND FRUITS (OTHER THAN CITRUS) 1935-44
(In Dunams)

| Year | Cereal | Vegetables | Fruits |
|------|-----------|------------|-----------|
| 1935 | 6,535,031 | 118,542 | 879,813 |
| 1936 | 6,365,636 | 145,871 | 1,046,111 |
| 1937 | 6,300,310 | 151,520 | 1,062,753 |
| 1938 | 5,766,009 | 133,333 | 1,059,003 |

the mid-1930s was of a constant and intensive decline in pre-capitalist forms of agricultural production which were being replaced by capitalist forms of production. As Table 3 shows cereal production was gradually but intensively undergoing a process of decline in terms of tonnage and value, while the production and value of cash crops was rising.

In 1935, out of a total area of 75,33,386d under all crops cereal cultivation occupied 6,535,031d or 87 per cent of the area (Table 1) but produced a value of PL 15,97,100 or 53 per cent of the total value produced by the three crops (Table 3). On the other hand, both vegetables and fruits which occupied just 9,98,355d or 13 per cent of the total land (Table 1) yielded produce to the value of PL 13,86,979 making 47 per cent of the total value (Table 3). The trend continued throughout the 1930s and 1940s. Cereal cultivation occupying vast areas yet producing much less income than the smaller areas under commercial crops.

The only exceptional years in Table 3 are 1943 and 1944 when a rise in prices of all three products occurred. This phenomenon was largely due to the second world war and the general rise in consumer prices at the international level. Nevertheless, this rise too favoured the more commercial crops such as fruits and vegetables.

The process of the displacement of small scale by large scale production is considered by Marxists as the fundamental and principal trend of capitalism [Saleh, 1979, Barakat, 1978, Bagchi, 1982, Patnaik, 1983]. The consequence of this is not necessarily the immediate expropriation of the peasants, but it nevertheless causes 'the ruin of the small farmers and a worsening condition on their farms'. This process as Lenin observes 'may go on for years and decades' [Lenin, 1977:70].

The mechanisation of agriculture was not confined to the private settlements, known otherwise as the moshava (plural moshavot). In fact these modern methods of agricultural production were characteristic of all Jewish settlements including the co-operative known as the moshav and the kibbutz. Alongside the development of the forces of production, the social relations of production in agriculture, it will be shown here have also changed.

WAGE LABOUR IN AGRICULTURE

The quantity of hired labour exploited in reproducing the European Jewish capitalist economy was phenomenal in all private and some co-operative settlements. In a 1938 survey, for example, it was revealed that five settlements employed 13,200 wage labourers. Hired labourers were drawn from both the indigenous Palestinian population as well as the Jewish settlers, 7,700 or 58.3 per cent of the labourers were Jewish and 5,500 or 41.7 were Arabs [Gozansky, 1986:146]. The large dependence on wage labour was partly related to the fact that many private settlers

used land and agriculture simply as a means of making profits.

The phenomenon of absentee landlordism within the Jewish economy was widespread. In a 1938 survey, for example, it was reported that 34 plantation settlements were owned by 1,515 farmers who lived on the land and 1,113 absentee owners. In these farms an estimated 10,000 wage labourers were employed, that is, four wage labourers for each farmer. In this case as well both in indigenous Palestinians and Jewish workers were hired 6,500 Jewish labourers and 3,500 Palestinian labourers [Gozansky, 1986:146].

Wage labour was also used in some co-operative settlements, particularly the moshav. A 1941/42 survey conducted by the Jewish Agency revealed that out of a total Jewish agricultural population of 1,34,276, 63,454 or 47.3 per cent were wage earners involved in various occupations. Of these, 27,114 persons or 42.7 per cent were agricultural wage labourers and the rest worked for industry, construction and other fields.²²

The exploitation of labour power in general, and within agriculture in particular, has received very little attention by most Israeli official writers. In fact by over-emphasising co-operative labour arrangements, authors have totally ignored the exploitative nature of production relations within the European Jewish economy. Not only were the relations of production within the moshav and kibbutz misrepresented, production relations within the private settlements, the moshava were also masked.

Various authors argue that the Zionist control of Palestine nationalised or even socialised all relations of production. This claim is not only made with regard to the co-operative farms, but also refers to the private settlements of the Rothschilds. It is argued that with the development of the Zionist movement, the conflict between the capitalists and the Zionist socialists was

resolved with the triumph of 'socialist Zionism' over capitalism. As a good will gesture on the part of Rothschild, it is maintained, his property was totally transferred to the Palestine Jewish Colonisation Association (PICA) and consequently fell under the control of the Jewish Agency.

A closer examination of this 'transfer', however, reveals a different picture. Data suggest that control over the Rothschild's settlements passed only temporarily to PICA. This was during the four-year period of 1920-24, after which the baron returned to Palestine and assumed full control over his property.

More importantly, the conflict between the Rothschilds and representatives of the Jewish Agency was not one between the adherents of capitalism and the adherents of socialism. It was not between capitalists and anti-capitalists, as some authors suggest [Kimmerling, 1983, Ohana, 1981, Eisenstadt, 1985]. On the contrary, it was between two sections within the Jewish bourgeoisie, on the one hand the Jewish Agency represented by big investors like Ettinger, Goldberg and Ussishkin who themselves occupied high political posts within the Agency,²³ and on the other, the baron who owned most of the moshavot.

The conflict in fact had little to do with the private or capitalist nature of these settlements as both conflicting sides were capitalists. The nature of the conflict was political instead. It was around control over the source of hired labour. The essence of the conflict basically revolved around the question of which labourers should be hired in these settlements: indigenous Palestinian or European Jewish workers.

Officially the conflict was resolved in 1924 by expelling 6,500 Arab workers and replacing them with Jewish workers. Yet, tensions between private farmers employing Arab labourers and the Zionist authority remained largely unsettled. We will show later that

TABLE 3 PRODUCTION OF CEREAL, VEGETABLES AND FRUITS FOR SELECTED YEARS

| Product (Tons) | Cereal | | Vegetables | | Fruits | |
|-------------------|-------------------|---------------|-------------------|---------------|-------------------|---------------|
| | Product (Tons) | Value (PI) | Product (Tons) | Value (PI) | Product (Tons) | Value (PI) |
| 1935 | 248,408 | 1,597,100 | 67,847 | 365,735 | 162,984 | 1,021,244 |
| 1936 | 181,700 | 1,173,526 | 70,321 | 400,384 | 186,498 | 1,063,192 |
| 1937 | 298,200 | 2,225,875 | 120,395 | 480,733 | 230,034 | 1,197,369 |
| 1938 | 202,973 | 1,264,481 | 109,088 | 575,048 | 248,573 | 1,213,020 |
| 1939 | 241,642 | 1,520,316 | 129,373 | 669,037 | 183,006 | 1,205,171 |
| 1940 | 337,411 | 2,800,047 | 198,273 | 1,244,477 | 204,183 | 1,711,988 |

private farmers continued to employ Arab wage workers and the Zionist authorities continued to harass both farmers and employees.

This case highlights the basic conflict within the Zionist colonial movement. The Jewish Agency which in this instance resorted to force in kicking out indigenous hired labourers from the Rothschild's plantations had in fact submerged the economic interests not only of the Rothschilds but also of its own members in favour of gaining long-term political hegemony in Palestine.

Throughout British rule, the moshavot continued to be the most important economic enterprises. In 1944, and despite their small number—estimated at 44 out of a total of 258 settlements—the 'moshavot' were economically the most advanced type of agricultural settlements.

The moshavot occupied an area of about 582,300d or 34 per cent of all Jewish land under settlement, including the most fertile land in Palestine. Most of the moshavot were concentrated in the plains particularly by the Maritime Plain. In 1944, the 'moshavot' owned 90 per cent of the total land under Jewish citrus plantations. They occupied 21,800d or 50 per cent of all Jewish land under fruits other than citrus and 297,500d or over 40 per cent of the total Jewish land under irrigated fodder, vegetables, etc, leaving most of the land under less commercial and more extensive methods of cereal cultivation to other settlements.²⁴

Agricultural production was highly specialised in the moshavot. In 1939 a survey of 34 moshavot revealed that out of a total area of 2,08,000d occupied by these settlements, 46,000 dunams or 22.1 per cent were under citrus production; 26,000 dunams or 12.5 per cent under grape and only 19,000 dunams or 9.1 per cent was under extensive cereal cultivation [cited in Gozansky, 1986:173].

The private nature of these settlements and the economic prosperity they provided to their owners attracted many settlers. Whether wage labourers or capitalist farmers, the population of these settlements witnessed a sharp increase during the British rule as Table 4 illustrates:

In absolute terms, the number of people in these settlements increased greatly over a short span of time: From 11,540 people to 27,740 or by over 140 per cent between 1922 and 1931. One decade later, i.e., from 1931 to 1941, the population of the moshavot increased by about 128 per cent. Their relative population, however, declined. This is largely attributable to the development of moshavot and kibbutz forms of settlements.

ZIONISM AND 'WORKERS' CO-OPERATIVES'

The extensive body of literature on the co-operatives is largely inaccurate and deficient. By lumping together all forms of co-operative settlements, the literature fails to account for the fundamental difference bet-

ween the kibbutz and the moshav as well as the differences within the moshav(s) themselves. Authors have also ignored the actual and potential social contradictions inherent in these forms of production.

Virtually all uncritical writers present these co-operatives as 'socialists' or 'primitive communist' communities or even, in one case, as the "ideal society for the fulfilment of human dream" [Tabenkin, 1985; Bettelheim, 1971; Rinehart, 1971; Eisenstadt, 1985; Spiro, 1972]. Yet, as various authors have correctly noticed, the co-operatives have always been integral parts of the capitalist mode of production [Rayman, 1981; abu-Rjeily, 1970]. To this analysis we will now turn.

A common set of assumptions shared by most Israeli and other romanticisers of these forms of labour organisations involves the two fundamental components of these settlements, landed property and wage labour. Authors argue that land in the co-operatives was not privately owned, thus concluding that land was collectively or communally owned. They also claim that wage labour was in principle forbidden in the co-operatives, hence strengthening further their contention that the co-operatives were socialist or even communist. However, as the following argument will show this claim has little, if anything, to do with reality.

Instead of finding out who actually owned and controlled the land and how land was distributed to members of the co-operatives, most authors assumed that private property within the Zionist settlements was absent and consequently concluded that the means of production in these settlements were socialised. As a result, in the vast majority of the literature the kibbutz is described as an example of "workers' control and ownership of the means of production"²⁵ or as an egalitarian society of "total equality among its members" [Spencer, 1981:171]. The term 'communist society' is often used to refer to early Zionist settlements [Viteles, 1944; Spiro, 1973; Bettelheim, 1971].

This literature suffers from a major theoretical flaw. It fails to show why the form of landed property necessarily indicates a specific mode of production. In fact there is no necessary correspondence between the form of landed property and the mode of production. Capitalism can be introduced through non-capitalist forms of landholding, as a consequence which may or may not have been intended. Whether landed property was private, individual, state owned or communally possessed, it must be stressed, capitalism at all stages of its development is capable of penetrating the agrarian economy.

All forms of property, Saleh maintains, are capable of providing fertile soil for capitalist development. "There is no contradiction," he argues, "between state property and agricultural capitalism" [Saleh, 1979:29]. In other words, what is important here is not the form of landholding but

rather the mode in which land is exploited and the purpose for which crops are produced.

Production in the moshavs and the kibbutzim was not organised on the principle of self-sufficiency of their members. Members did not produce use value but rather commodities, the exchange value of which was realised by the members only after it circulated in the market. At the empirical level however, one must also consider the question of who owns and/or controls the means of production in these settlements. Land in the co-operatives it should be stressed, was to a large extent owned privately by the Jewish Agency or its settlements institutions. What was absent was not private ownership but rather individual ownership by members of the co-operatives.

Moreover, the means of production, that is other than land in these settlements were not, as most authors believe, owned and controlled by their members. In fact the Keren Kayemet, (Jewish National Fund), an arm of the Jewish Agency was the sole owner of land capital and technology in the co-operatives. The Keren Kayemet advanced capital in the form of land and other means of production and expected payments in return. Recipients of capital advancements made by the Keren Kayemet particularly within the kibbutzim had to meet certain economic and, even more importantly, political requirements.

The Keren Kayemet was by no means a public or socialist body at odds with private property. The Keren Kayemet was partly funded by private companies, such as the Jewish Colonial Trust and the Anglo-Palestine Company which were established at the turn of the century. In addition it was involved in a prolonged international campaign for collecting money from various Jewish individuals and organisations.

Similar to other international companies operating in Palestine, the Keren Kayemet was heavily involved in colonial activities. These included buying and selling land, tree planting and settlement preparation. What distinguished the Keren Kayemet from other companies, however, was the fact that, while colonialism for the other companies was

TABLE 4: NUMBER AND PERCENTAGE OF MOSHAVOT POPULATION VS. TOTAL JEWISH RURAL POPULATION

| Year | Total Jewish Rural Population | Moshavot Population | Per Cent of Moshavot Total Population |
|------|-------------------------------|---------------------|---------------------------------------|
| 1922 | 14,140 | 11,540 | 82 |
| 1927 | 27,500 | 20,220 | 74 |
| 1931 | 37,240 | 27,740 | 75 |
| 1936 | 87,110 | 59,530 | 68 |
| 1941 | 111,250 | 63,240 | 57 |
| 1944 | 139,000 | 76,000 | 56 |

primarily for economic gain, for the Keren Kayemet the goal of colonialism was above all political in nature [Doukhan-Landau, 1980: 200; Gozansky, 1986:57]. There is a partial truth in the claim that land under the control of the Jewish Agency or any of its arms was withdrawn from the market [Kimmerling, 1983:34]. But it is also true that this withdrawal was one sided. The land which under the policy of the Keren Kayemet became the inalienable property of the Jewish people was in fact alienated from the indigenous owners/possessors. Indigenous Palestinians were excluded from claiming back, buying or even working on this land.

The withdrawal of the land from the market, in fact, did not affect the fact that land under the control of the Jewish Agency continued to be dealt with as a commodity and a means to promote capitalism. This was established by Rupin, the head of the Jewish Agency who in his report on the Land Development Company stated:

With regard to the important question of attracting capital to the 'land of Israel' I submit the following. During the first five years of our work it became clear that in order to attract big capitalists to invest in land, we had to be able to convince them that their capital would have a reasonable return. We, for that matter, were able to do so, since we showed all those who invested in industry how smooth it is to do so when they buy land from us... During the past five years, around one million francs were invested in our company. The Land Development Company sold to individual investors, land of the value of one and a half million francs and the urban branch of our company has sold land of the value of one million francs [cited in Gozansky, 1986:58].

In other words, the owner/controller of the land within the co-operatives, while not the individual member, was nonetheless a political agency whose aims were not entirely antagonistic to private ownership and capitalist principles. This agency was an integral part of the larger European Jewish economy in Palestine.

WAGE LABOUR AND CO-OPERATIVES

The second dubious assumption made by many previous analyses of the kibbutz movement concerns the supposed absence of hired labour in the co-operatives. They argue that the ideals of 'Jewish labour' and 'Jewish land' were the guarantors for the socialisation of labour and the absence of relations of exploitation [Eisenstadt, 1974; Tabenkin, 1985].

However, as with the claims for the absence of private land ownership, a closer look at the evidence fails to support this position. The principles of 'kibbush ha-adamah', (occupation of land) and 'kibbush ha-avoda' (occupation of labour), or what was otherwise known as 'adamah Ivrit' (Jewish land) and 'avodah ivrit' (Jewish labour) were, indeed, advanced by the Zionist leadership to promote the co-operative forms of agricultural colonisation.

Yet, the materialisation of these principles did not result in socialism. On the contrary, these policies were aimed primarily at creating a nationalistic exclusivist economy for the Jewish community in Palestine.

The hiring of labour power was never at odds with the principles or policies of the Jewish Agency or any of its affiliates. The aim of these policies was to exclude the indigenous Palestinian workers from employment in the co-operatives. This was expressed at almost every opportunity by Zionist organisations. In the International Zionist Annual Conference on August 14, 1929 in Zurich, the following was resolved:

Land is to be acquired as Jewish property and subject to the provisions of Article 10 of this agreement, the title to the lands acquired is to be taken in the name of the Jewish National Fund, [Keren Kayemet], to the end that the same shall be held as the inalienable property of the Jewish people.

Furthermore:

The Agency shall promote agricultural colonisation based on Jewish labour, and in all works or undertakings carried out or furthered by the agency, it shall be deemed to be a matter of principle in that Jewish labour shall be employed.²⁶

Boycotting Arab labourers was written as a condition to land leased by the Keren Kayemet. In a reference to the Maritime Plain co-operatives the following was stated.

The settler hereby undertakes that he will during the continuance of any of the said advances, reside upon the said agricultural holding and do all his farm work by himself or with the aid of his family, and that, if and whenever he may be obliged to hire help, he will hire Jewish workmen only.

Similar terms of lease were adopted with regard to co-operatives established in the Marj Plain: "The settler undertakes to work the said holding personally, or with the aid of his family, and not to hire any outside labour except Jewish labourers".²⁷

The Keren Kayemet, in fact, went so far as to impose a penalty on any Jewish owner attempting to employ an Arab worker. Article 23 of the lease stipulates:

The lessee undertakes to execute all works connected with the cultivation of the holding only with Jewish labour. Failure to comply with this duty by the employment of non-Jewish labour shall render the lessee liable to the payment of a compensation of ten Palestinian pounds for each default... Where the lessee has contravened the provisions of this Article three times, the Fund may apply the right of restitution of the holding, without paying any compensation whatever.²⁸

It is important to point out here that the Zionist exclusivist policies were formally supported by the British government. The debate which ensued in the House of Lords around these policies resolved the following: "The acquirement of large tracts of land in Palestine on inalienable trusts by Jewish bodies should be allowed; and conditions should be allowed to be inserted in leases or

tenancy agreements from such sources preventing any but Jewish labour on lands comprised in such leases or tenancy agreements".²⁹

Data above suggest that, neither the moshavs or the kibbutzim were prohibited, in principle, from exploiting hired labour. What they were forbidden to do is hire non-Jewish or Arab labour. The dispelling of these two major misconceptions is fundamental for understanding the true nature of these settlements. There were inherent contradictions within the structure of the Jewish co-operatives. While these contradictions surfaced early on in the case of the Moshav, for reasons to be discussed later, they took longer to emerge within the kibbutz enterprise.

THE MOSHAV

The literature on the co-operatives, as pointed out earlier, lumps together the 'moshav' with the kibbutz by highlighting the latter only. This is despite the fact that the moshav at least until the early 1940s, proved to be economically and demographically more successful than the kibbutz. Land in the moshav, like that in the kibbutz, was owned and controlled by the Keren Kayemet which in turn advanced all means of production to moshav members. Members of the moshav usually came from the better-off sections of the working class or from the middle class families. Work on the family farm was mainly done by family labour. At the end of the production process, the Moshavs Councils marketed the produce and paid each family according to its produce. From the cash obtained, each family was expected to cover its consumer needs and pay its share of rent fees and other dues to the land owner.

After a certain period of residency if families found themselves capable of buying the land without depending on the Keren Kayemet they could do so. In the process, families with better financial resources than others were able to own their own property while at the same time live in the moshav. This was the case in the Moshav Shittofi (literally, collective settlements), referred to in the literature as 'the middle class' moshav. In the Moshav Shittofi settlers privately owned the land and exploited outside wage labour [Sae'd, 1985:120].

The moshavs, both economically and demographically were more popular than the kibbutzim. During British colonialism, the agricultural population of the moshavs grew rapidly. From a total of 400 people or just less than 3 per cent of the total Jewish agricultural population living in the moshavs prior to 1920, the relative population of the moshav grew to 10 per cent in 1922; 17 per cent in 1927; 18 per cent in 1936 and to 22 per cent in 1941. In 1944, 29,500 people or 21 per cent of the Jewish agricultural population were living in 99 moshavs.³⁰

In addition, until 1936 the moshavs were the second largest form of enterprise—after

the moshava—and as the following table shows, more populated than the kibbutz.

However, with the tremendous emphasis placed by the Zionist movement on the kibbutzim in the late 1930s the place of the moshav in the co-operative system began to decline. Some authors maintain that the unpopularity of the moshav was the result of economic factors. They claim that the development of private ownership and the hiring of labour defeated the whole thrust of co-operation and collectivity [Spiro, 1973:5]. However, one can point out here that the use of hired labour was also a part of the structure of the kibbutz, yet its popularity was never harmed. The real reasons behind the popularity of the kibbutz, it will be demonstrated, was not its socialist traits, nor the lack of exploitation. It was the geo-political and military services which the kibbutz and not the moshav was able to provide to the Zionist colonial project which in fact accounted for its importance.

To begin with, two widely held misconceptions about the kibbutz experience must be discussed. The first is the claim that this experience was uniquely Jewish or Zionist and the second is the belief that its success was due to the strong belief in socialism brought by the Zionist settlers.

(1) 'Uniqueness of kibbutz'

Most authors see the kibbutz as a unique Zionist or Jewish phenomenon. Tabenkin who was considered one of the founding fathers of modern Israel and among the pillars of socialist Zionism described the 'kibbutz' as 'the apex of human experience, the only commune in the world which has not been founded by the social democrats nor by Bolshevism' [Tabenkin 1985:44].

There is some truth in maintaining that the kibbutz was different from the collective experience in the Soviet economy. Since at least in theory, the Soviet economy was socialist while the European Jewish one was predominantly capitalist. However, historically, the presence of a co-operative or a collective society in the midst of a capitalist system is not unique to the European Jewish settler's experience. Historical parallels to the kibbutz were known in mid 19th century Britain when Owen's 'communist societies' were formed.

Commenting on this phenomenon, Engels highlighted two functions he believed were crucial in the establishment of these communal societies. On the one hand, he pointed out that this arrangement was economically rewarding for both the members and the owner himself 'Owen's communism', Engels states "[W]as based upon this purely business foundation, the outcome, so to say, of commercial calculations. Thus in 1873, Owen proposed the relief of the distress in Ireland by communist colonies, and drew up complete estimates of costs of founding them, yearly expenditure, and probable revenues" [Engels, 1977:123].

While for the workers this arrangement secures employment and living conditions, for the owner it can also be rewarding. In the light of the fact that all decisions concerning production, the realisation of surplus value, supervision, management, etc., are left to the members, this organisation can serve as a means for the conservation of human and capital resources. It saves the owner the cost of managing, supervising and controlling production and reproduction in his enterprise.

Described by Engels as utopian socialism, Owen's enterprises had another dimension. These societies functioned as a response to the crying social abuses and the loosening of all traditional moral bonds created by capitalism. Owen, Engels writes, wanted to place the people in conditions worthy of human beings, and especially by carefully bringing up the rising generation [Engels 1977:124].

The experience of Segera, the first kibbutz which was built in 1908 on the land of the Arab village carrying the same name, provides striking parallels to Owen's experience. In 1908 a group of Jewish workers contracted the work in Segera for a period of one year and established the first kibbutz. This group was collectively responsible for redistributing the work among all its members. No hired labour was employed. All decisions concerning production, marketing, organisation and so on were carried out collectively by the group. This experience proved to be economically successful. At the end of the contract the group was able to pay back all its dues and also make profits for itself [cited in Kavyali 1966:24-25]. Although the group did not renew its contract and the Segera experience was short lived, it nonetheless left its imprint on the Zionist leadership and was considered an example to follow.

In the late 19th century the kibbutz concept was also enhanced by the fact that many Jewish settlers during the time had fled economic difficulties and socio-cultural persecution practised against them in Eastern Europe and Czarist Russia. However, since on motivation alone, no

socio-economic structure can be established, the dreams of the early settlers never materialised. Partly due to the fact that Jewish colonial companies at the time were not interested in this form of enterprise and partly due to lack of funds and political commitment on the part of the Keren Kayemet, the kibbutz concept did not initially flourish.

As a matter of fact, it has been reported that the first attempt at establishing a kibbutz which involved the Keren Kayemet in 1913 was a marked failure. In this case, a 'kvotza' (group) of five rented a piece of land from the Keren Kayemet and received some capital advancement but, because of the excessive payments which the 'kvotza' was required to return to the Keren Kayemet, the plan was halted. Both the 'kvotza' and other potential settlers interested in such an enterprise were further discouraged [Gozansky 1986:73]. The idea of the kibbutz was revitalised only after the entry of British colonialism, largely due to the increasing economic and political power of the Zionist movement in Palestine.

(2) Kibbutz 'Fulfilment of Ideals'

As alluded to earlier, literature has presented the kibbutz as 'the fulfilment of the Jewish dream or the materialisation of the Zionist ideal' [Tabenkin 1985, Orchan 1977, Rosen et al 1983, Eisenstadt, 1974].

It is assumed that the kibbutz is the product of an idea, a dream or a set of ideals put forward by the Zionist movement in Palestine. The kibbutz in other words is perceived as a package of ready made concepts produced in Europe and imported to Palestine by the Zionist authorities. This body of literature does not provide an objective scientific approach to the kibbutz. Instead it romanticises the kibbutz and discusses it as a separate and independent social phenomenon.

Extensive material has been published on the socialisation of children in the kibbutz. In *Kibbutz Venture in Utopia*, Spiro depicts the kibbutz children or what he calls "the generation of the desert" as the cultural

TABLE 5. PROPORTION OF POPULATION OF KIBBUTZ, MOSHAV AND MOSHAVA, SELECTED YEARS

| Year | Settlements | | Total | Agricultural Population | | |
|------|-------------|---------------|---------|-------------------------|-------------------|--------------------|
| | No. | Area (Dunams) | | Kibbutz (Per Cent) | Moshav (Per Cent) | Moshava (Per Cent) |

heroes" of the Jewish people [Spiro, 1972] They are described as the "torch-bearers and liberators of the Jewish people" [Tabenkin, 1985] In fact, some writers go as far as to portray the kibbutz as a "civilising mission against the barbarians" [Orchan, 1977:30]

The kibbutz is seen as the haven for gender equality, the only society which is capable of replacing patriarchal family life with egalitarian group life [Orchan, 1977, Rayman, 1981, Spencer, 1981] In the *Children of the Dream*, Bettelheim goes into length detailing what she sees as the strong emotional ties within the kibbutz families. The whole kibbutz in Bettelheim's view was turned into one big family [Bettelheim, 1971]

Nowhere in this literature has there been any attempt to locate the kibbutzim within the social and economic structure within which they were founded. Kibbutzim did not emerge fully formed from a set of ideals nor were they operating in a social vacuum. In fact, at every stage of their development the kibbutzim were faced with both internal structural as well as external forces. These forces have largely influenced their structure and development.

The kibbutz was—and still is—composed of a small community ranging between 30 to 300 people per kibbutz and the size of its land between 2,000 to 20,000 [Kayyal, 1966:30-31]. During British rule, the kibbutz population grew from 3,000 people in 1931 to 33,360 in 1944. Yet the ratio of the kibbutz population to that of the Jewish population in general remained very minimal. In 1931 the kibbutz population represented only 2 per cent of the total Jewish population and 4 per cent in 1944.¹¹

Unlike the experience of the Segera and contrary to the impression given by the literature, the kibbutzim throughout the 1920s and the 1930s were never able to stand on their own without heavy dependence on external sources for funding.

As was mentioned earlier, most fertile land appropriated by European Jewish settlers was already occupied by the private settlements leaving only less fertile land for later settlement. Low fertility within the kibbutzim, as further discussion reveals, was also enhanced by the fact that most kibbutzim were established for other than socio-economic reasons. In addition, the capital needed for irrigation, mechanisation and other equipment was not always available. Kibbutzim during the 1920s were reported to be under equipped and serious complaints and dissatisfaction was widespread among their members.

Even earlier kibbutzim which were erected on Palestine's most fertile land, the Marj, were suffering from serious problems. Commenting on this situation one Jewish agricultural expert said:

No expenditures for planting new colonies should be made unless the development of existing colonies has been completed, or the money for their full development has been provided. The amount required for this will

absorb the probable normal income of the colonisation department for several years to come. Delay in providing settlers with needed equipment and improvements is now causing losses and disappointments. It is lowering the efficiency of the settlers. It is the cause of large deficits.¹²

In the late 1920s and early 1930s the whole kibbutz movement appeared to be in danger of collapsing. For a period of three years, 1929-1931, only three kibbutzim were established.¹³ Economic difficulties were not the sole or even the most important factor in the slow growth of the kibbutzim. Internal political factors were equally crucial.

The Palestinian peasant uprising of 1929 and the consequent pressure on the government to restrict immigration and land transfer to the European Jewish community had a great impact on the settler movement. The uprising gave a strong message not only to the Zionist authorities in Palestine but also to potential investors. Jewish capitalists, as a result, preferred to privately and directly invest their money rather than putting it in an unpredictable 'public' enterprise. This is illustrated by the failure of the urgent appeal for funding made by the Keren Kayemet to the World Zionist Organisation in its 16th Zionist Congress.¹⁴

The situation after the second half of the 1930s was radically different. Partly due to the influx of capital and settlers prompted by the Nazi atrocities, and partly due to the strengthening of the political position of the Zionist movement world wide, the kibbutz movement experienced a real upsurge. Between 1932 and 1936, 18 kibbutzim were established, i.e. an average of 3.6 kibbutzim per year. An even sharper rise occurred between 1937 and 1939 when 28 kibbutzim were established, raising the average to 9.3 kibbutzim per year.¹⁵

The sharp rise between 1937 and 1939 was in fact a direct reaction to the serious threat posed by the Palestinian revolution of 1936-39. The pressure placed on the government, by the revolution, forced it to issue a 'White Paper', changing its immigration and land transfer policies.¹⁶

For the Zionist authorities, the change in the government policy together with the rebellion which was in its second year meant that they were under tremendous pressure. What was at stake was not only the preservation of the existing settlements but the realisation of their dreams for a Jewish state. This meant that they had to create as many settlements as possible irrespective of the government policy or the indigenous resistance. This resulted in the settlement movement referred to as the 'Tower and Stockade'. Irrespective of their size, the fertility of the land or who might inhabit them, 'kibbutzim' during this period were stockpiled. It was reported that some 'kibbutzim' were erected in a matter of single days. The only consideration in this movement was to make sure that 'kibbutzim' would serve as

observation sites and border security for the future Jewish state.

There are various interpretations as to why the government allowed this movement to precede. Some authors suggest that during this period, the Zionist movement has begun to establish itself as a potent independent political and military power [Rayman, 1981:38]. Yet, others maintain that the Zionist lobby in London has always been successful in defeating all government decisions including all 'White Papers' introduced during the British rule, [Stein, 1984:135].

While there is some truth in their claims, authors here provide a simplistic answer to a much more complex situation. A partial explanation of the Zionist expansionist policies can be found in the fact that while the government did not approve of their policy, it felt that it could not afford to open another battle front with them. Moreover in 1937 the government was pre occupied with crushing the Palestinian and northern Palestine.¹⁷ They were able to take advantage of the growing military power of the Zionists in order to help quell this revolution. Jewish settlers, as the secretary of states for the colonies wrote to the high commissioner in 1937, "were reliable in the police and armed forces."¹⁸

(3) Kibbutz: A Social Utopia

Unlike the Marxist principles of scientific socialism the kibbutz's socialism was, similar to that of Owen's experience, utopian in nature. But contrary to Owen's experience, kibbutzim were not created as anti capitalist or non exploitative societies. Nor were they created as safe or peaceful refuge for victims of wars and other forms of repression. On the contrary, the kibbutz mission as perceived by its main 'socialist Zionist' pillars was mainly to build a generation of 'fighters' [Ben Gurion, 1971, Tabenkin, 1985].

Socialism in the Marxist sense which is expressed in terms of socialising the means of production and creating a classless society was of very little importance for 'Zionist socialist' leaders. Classes and wage labour were always viewed as necessary for the development of the kibbutz. In a speech addressed at the anniversary of one kibbutz, Ben Gurion was quoted as saying "The value of kibbutz is in its collectivism rather than its struggle to achieve equality. Equality is against human nature, men are not equal and therefore they have no equal rights" [cited in Tabenkin, 1985:51].

Class inequality was bound to develop further with the industrialisation of the kibbutz which began as early as 1930s. The phenomenon of hiring outside labour in the kibbutz or members hiring themselves out was present during the British rule [Golomb, 1974:181-195]. Writing on this, Criden and Glebb said "In the 1930s the rejection of hired labour was severely threatened: the industrialisation of the kibbutz has resulted in a shortage of kibbutz labour" [Criden and Glebb, 1974:13]. With the further

development of the 'kibbutzim, and especially after the creation of the state of Israel, industrialisation and the hiring of wage labourers both from within and from outside the kibbutz became indispensable to the existence of all kibbutzim. Rosenfeld observed that "class differentiation in the kibbutz occurred as early as 1951" [in Rayman, 1981: 83]. By 1959, it was reported that 20 per cent of the total income of all kibbutzim was drawn from industrial enterprises, which employed both Arab and Jewish labourers. In the same year the kibbutz industrial wage labourers made up 7 per cent of the total industrial labour force in Israel.³⁹

Gender inequality in the kibbutz, as various writers admit, was always a serious problem without a solution. Women continued to be relegated to household related functions, such as kitchen—dining room work, baby houses, children houses, etc., while men worked in factories, agriculture, kibbutz administration and the army [Rayman, 1981: 203].

Also, racial exploitation was a structural feature of the kibbutz. The exclusivist policy of selecting the 'kibbutz' members did not only affect the indigenous Palestinians. Racism was also practised against the 'Sephardic' Jews (Jews who immigrated from Arab countries). Kibbutz members, Spiro pointed out, despised Arab Jews and often referred to them as *shechorim* i.e. blacks, [Spiro, 1972: 109].

(4) Kibbutz: A Settler Colonial Society

The kibbutz was established not as a means to transform an existing social order but rather as a means to create a new political order. The kibbutz served as the embodiment of the Zionist ideology of conquering land and labour. Co-operation and socialism, in the Zionist lexicon, were synonymous with the colonisation of land, labour and the market in Palestine.⁴⁰

The importance of the kibbutz as a colonial venture outstripped all economic and social considerations. Tabenkin summed up this point plainly when he stated: "Our minds and thoughts are constantly devoted to the need for security. It was not chance which dictated the location of our settlements at the expense of economic viability, we chose those sites with mostly their security in mind" [Tabenkin, 1985: 54].

The creation of kibbutzim, regardless of whether or not they were properly equipped or populated, was phenomenal during the thirties.

The under equipment of the existing kibbutzim did not deter the World Zionist Organisation and its Palestinian branch from adopting the following resolution:

The most important task of the Jewish National Fund [Keren Kayemet] in the immediate future is the creation of land reserves in all parts of the country, in particular the Congress is of opinion that it is necessary to create as soon as possible a land reserve of irrigable lands in accordance with

a definite plan for colonisation policy. The colonisation of Palestine is to be the basic policy of the Jewish Agency for all time to do everything to assure development and extension of time to do everything to assure development and extension of Jewish agriculture colonisation in accordance with the principles laid down by the Congress for co-operation with the Jewish Agency on as large a scale as possible.⁴¹

The colonial settler nature of the kibbutz was expressed in terms of its geo-political and strategic role as well as in terms of its military functions. Most kibbutzim, especially after the 1930s were built on hills and on the borders of Palestine. Both Chaim Weizman and Ben Gurion who represented the Jewish Agency, recommended the 'stocking' of kibbutzim on the borders of Palestine.

According to Ben Gurion: "If there are two to four settlements on the frontier this will reinforce our rights on the upper Galilee" [in Rayman 1981: 33].

The fact that the European Jewish settlement in general and the kibbutz in particular was a colonising and imperialist movement was not disputed by Zionist leaders. Writing on the kibbutz as a colonising movement, Tabenkin said:

We were the pioneers to work on the sea. None of our members were born sailors or fishermen. Yet the very fact that we were a colonising movement made us realise that Jews do not require only the land but the sea as well. We have to conquer the sea with our fishing boats and our merchant ships. Only thus can the country be protected from the sea.

Moreover, under the title *Our Imperialism* Tabenkin wrote:

How does the kibbutz imperialism manifest itself? It is through our striving to always be the first to tackle any hard or dangerous job. The kibbutz never neglects any pioneering prospects. This is why our kibbutzim were the first to settle by the sea, start the fishing industry, join the [British] police force, work in the stone quarries or in Sdom (the lowest spot on earth) where the temperature is unbelievably high and where salt and other minerals. We were imperialists in that ours was the initiative to organise illegal immigration and to do everything in order to enhance the prosperity of the country and of our collectives at the same time. The power of our kibbutzim is not measured by their numbers but in their places on the map [Tabenkin 1985: 61-62].

The kibbutzim played a major role in furnishing political leadership and military bases for the Jewish state. By carefully selecting their members, the kibbutzim accorded special priorities to the Jewish intelligentsia from the 'achkenazi' (European) origin who were considered as the true representatives of 'Zionist socialism'. The kibbutzim were rapidly turned into bases from which most Zionist leadership was drawn. This trend became more obvious after the establishment of the state of Israel. Members

of kibbutzim, as Rosen maintained: "Have often held leadership positions in Israeli parties and have represented them in the government the Knesset and in Histadrut institutions" [Rosen et al, 1983: 7].

Finally, the kibbutzim functioned as military bases for the settler community. The militarisation of the kibbutz was as old as the kibbutz itself. Together with the kibbutz, the phenomenon of 'Hashomer Ha-Tzair' (young guards) emerged. The emergence of this phenomenon in the form of bands of armed settlers was justified as a need to 'protect' the settlements from their 'hostile' or 'barbaric' surroundings.

Yet documents show that the Palestinian peasants were the ones who needed protection from the armed settlers placed on their expropriated lands. Reports on attacks made by armed settlers who were sent to 'protect' land, the ownership on which was often unsettled, were very frequent during British colonialism.⁴²

By late 1930s 'Ha Hashomer' movement which was entrenched throughout Palestine was transformed into the official militant force of the Zionist movement, giving rise to the two underground semi-secret militant organisations, the Haganah and the 'Palmach' while the kibbutzim served as "bases and reserves" for their operations [Rosen et al 1983: 1].

In the late 1930s and early 1940s, the 'Haganah' as Rayman stated, began to see itself as the military basis of "the state on the way" [Rayman, 1981: 38]. It was involved in attacks not only against the indigenous population but extended its aggression also against the British government which had encouraged its rise in the first place.⁴³

To sum up European Jewish co-operatives including the kibbutzim were not unique or separate forms of production. The land occupied by the Keren Kayemet was not withdrawn from the market in the economic sense. Expropriated from its previous cultivators, this land was transferred to an exclusive Jewish market where it could still be used as a source of profit. What had been withdrawn or more properly, excluded from this market instead were the indigenous Palestinians themselves.

Production on these co-operatives, it has been shown, did not differ from that on the private settlements. Capital technology and the consequent large scale industrial production was characteristic of all European Jewish agriculture.

Finally, except for the degree and extent to which hired labour was used—and in the case of the kibbutzim the race of nationality of the labourers—all agricultural settlements exploited labour power and used it as a basis for expanding the economy.

The findings of this paper strongly refute the Zionist claim that the Palestinians did not succeed as the European Jewish settlers did because of their 'traditional' and 'backward' culture. The history of agricultural development in Palestine has proved without any doubt that the threat to the

indigenous agriculturists was anything but 'natural' or 'traditional-cultural'.⁴⁴ The real threat, instead was a direct result of the British and Zionist colonial powers controlling the Palestinian economy during this period.

At every stage in its development, colonial-capitalism emerged and expanded at the expense, and by the exploitation of the indigenous rural economy. All components of the rural structure, i.e. land, natural resources and labour power were subjugated and made heavily dependent on the developing capitalist economy.

The relationship of exploitation between the two economies, the European (Jewish) capitalist and the indigenous Palestinian pre-capitalist, it was argued, was the prime mover in changing the Palestinian history. While the dialectical relationship of domination and subordination can be attributed to all social formations experiencing capitalist development through a colonial power, the Palestinian experience remains historically specific.

In the colonies, the subordination of the colonised economy eventually leads to its full dependency on the colonial capitalist economy. This is equally true in the case of settler colonial formations. As the South African and Rhodesian cases show, the native population in both economies were turned into reservoirs for cheap labour exploited by the capitalist economy [Wolpe, 1980, Arrighi, 1973].

The colonial settler experience in Palestine, this paper has shown, demonstrates rather different characteristics. The economic subordination of the indigenous Palestinian working classes to the European Jewish capitalist economy formed only one aspect of the developing economic structure. The other aspect of the developing structural reality was the exclusion of the indigenous working classes from the dominant capitalist economy. Indigenous Palestinians, it has been shown, were placed under double subordination, the advent of capitalism and the consequent ruination of their 'natural' economy, resulting in their expropriation from their lands, and, through Zionist racist-nationalistic policies, they were prevented from having access to their land even as wage labourers.

Contradictory as this relationship of exploitation/exclusion might appear, it was this precise relationship which characterised the Zionist colonial movement in Palestine.

Notes

- 1 M. Berenstein, 'Jewish Colonisation in Palestine', *International Labour Review* 1934, Vol XXX, No 5, p 632.
- 2 Between 1932 and 1937, PL 3,95,17,000 of capital generated in Europe was invested in agriculture. Of this amount, PL 76,00,000 or 19 per cent were invested in citrus only. See, Gozansky, *Hitpathut ha kapitalism* p 104.

3 Calculated from *Statistical Abstract of Palestine*, 1937-38, Table 31, p 28. According to Gozansky, between 1930-42, 26,000 Jews immigrated to Palestine bringing with them a total of PL 26 million, an average of over PL 1,000 each. Gozansky *Hitpathut* in op cit, p 198.

12 Article 3 of the 1928 Exemption from Taxation Ordinance stipulates 'No title shall be payable on the produce of any land utilised for the purpose of agricultural instruction or research and certified as such annually by the competent authority'. See CO 733/139/9. Moreover, the 'Rural Property Tax 1933' exempted from taxes all newly established buildings for industry, all experimental and developmental land and all land with newly planted fruit trees. See CO 733/267 13.

13 'Simpson's Report', p 80.

14 Ibid, p 76.

15 See a despatch from the secretary of state for the colonies to the high commissioner, dated March 1933 in CO 733/229/10. Also in CO 733/229/10 file no 576.

16 In his *Zionism and Territory*, Kimmerling suggests that government's land policies throughout had favoured Arabs over Jews. According to him 'from 1921 many government land tracts were allocated to Arab and only a minority (about 20 per cent) to Jewish settlement and industry'. He further adds, 'until the end of the 1930s, Jewish land purchases did not harm a large stratum of Arabs, but rather represented a potential threat and created an impression that Jews had the ability to buy everything'. See Kimmerling, *Zionism and Territory* (University of California, 1983), p 36.

Kimmerling assumptions, it must be noted are baseless. In fact data suggests the contrary. By 1946, 18,07,300d or 28 per cent of the total agricultural land in Palestine was in the hands of European Jewish settlers. Of this, an estimated 1,75,088d were directly leased to them, for long periods, by the state. About 1,00,000d or 57 per cent of the state land, in fact, did not belong to the state.

The official terminology used to describe this

land was 'land with titles not yet settled', meaning that the state has not yet been able to prove that the land does not belong to its owners. On this issue, one government official quote 'all state land under titles not yet settled contain large areas which at land settlement may be found not to belong to government'.

In contrast, however, during the same period the fallahen received 17,591d. Only, under long term lease Government land policies at the time were, in fact criticised by its own officials who in 1945 stated 'The Jews have a substantial advantage over the free disposal of government land'. See *Survey of Palestine*, 1945-46, chapter VII, pp 267-68, chapter IX, p 372.

17 See a despatch by Luke, officer administering the government, to M P Amery, September 29, 1929 in CO 733/160/14 18) 'Government Role in Advancing Agriculture in Palestine', in CO 733/264/17. In another despatch by Luke, an officer administering the government, it was written that 'the Jewish villagers' administered by the Zionist Organisation prefer to take the loan in cash and make their own arrangement. See 'Despatch', dated 26/9/28 in CO 733/160/14.

18 See, CO 733/160/13.

19 *Survey of Palestine*, 1945-46, chapter IX, Table 6, p 379.

20 Ibid, p 378. Until late 1940, dairy farming made up two thirds of all agricultural production excluding citrus. See Abu Rjeily, *al ziraa' al yahoudieh*, op cit, p 137.

21 Commenting on the phenomenon of the displacement or take over of small scale by large scale production, Lenin states

[T]he fundamental and principal trend of capitalism in the displacement of small scale by large scale production, both in industry and in agriculture. But this displacement should not be interpreted merely as immediate expropriation. Displacement also implies the ruin of the small farmers and a worsening condition on their farms, a process that may go on for years and decades. This deterioration assumes a variety of forms, such as the small farmer's overwork or malnutrition, his heavy debt, worse feed and poorer care of livestock in general, poorer husbandry-cultivation, fertilisation and the like as well as technical stagnation on the farm, etc.

Lenin, *Collected Works*, (Progress Publishers, 1977) Vol 22 p 70.

22 *Survey of Palestine*, 1945-46, chapter IX, p 382.

23 Ettinger, Usishkin and Goldberg were the owners and directors of a Jewish colonial company called 'Giolah' (meaning savour). Ettinger's share of the founding capital in this company was estimated at 1,00,000 roubles. These big financiers have also invested in the Jewish Colonial Trust as well as the Anglo Palestine Company which became the central bank for colonisation activities. See Doukhan Landau, *The Zionist Companies for Land Purchase in Palestine* (Jerusalem, 1979), pp 197-200.

24 *Survey of Palestine*, 1945-46, p 373.

25 In his 1987 edition of *The Tyranny of Work*, Rinehart changed his position on the 'kibbutz'. The kibbutz as an example of 'workers control of the means of production' was dropped from his section on 'Solutions to alienated Labour' (Harcourt Brace Jovanovich, Canada, 1987), new edition

29 See a letter by the high commissioner, Chancell or, to the colonial officer, Shuckburgh, in CO 733/182/2, File, No 700/30. Imprisonment and heavy fines used to punish Jewish farmers for leasing land to Arabs has become a systematic policy for the Jewish state. Israel's plan for the Judaisation of the whole of Palestine was unveiled in 1976 after the Day of the Land. The leaking out of what was considered top secret document in the Israeli cabinet, the 'Koenig Memorandum' reveals the most blatant racist policy of the Israeli state. See 'The Koenig Report: Demographic Racism in Israel' in *MERIP Reports, Middle East Research and Information Project*, 1979, No 51. A complete English version can be found in Foreign Broadcast Information Service, September 14, 1976

30 Computed from *Survey of Palestine*, 1945-46, Chapter IX, pp 372-73

31 Ibid, p 373

32 Cited in 'Simpson's Report', pp 43-44. The Keren Kayemet policy of land purchase and lease was deemed objectionable by various Zionist leaders. In a decipher by one Zionist leader Harvey, dated September 12, 1930 a similar concern was voiced:

Area cultivable proves to be four million dunams less than was expected. Conditions on which Jewish National Fund purchases and leases land are [blank] and more land should not be allowed to pass to that fund until conditions radically altered. Jews possess large reserves of land not yet settled sufficient to enable settlement to continue for a number of years. See FO 371/1-4546

39 By 1959, 20 per cent of the total income in all the 'kibbutzim' came from industry, see

Kayyali, 'al-kibbutz...' op cit, p 56.

40 Differentiating between the Jewish settlers who immigrated to Palestine out of religious and cultural convictions, that is those 'who had come to keep their ancient laws, the Torah', and the 20th century Zionist settlement, Tabenkin noted:

They [early settlers] studied law from scrolls and letters, we rewrite ours on the landscape, on the hills and the valleys, releasing the ancient land from its arid desolation. Tabenkin, *The kibbutz: A Non-Utopian Commune* (Yad Tabenkin, Israel 1985) p 91. See also, Flapan, *The Birth of Israel: Myths and Realities* (Pantheon Books, New York, 1987)

43 The 'Haganah' was not a secret military force, nor the representative of an anti-imperialist settler community, as some authors claim [Emmanuel, 1972]. In fact many members of the 'Haganah' have received their initial training as British army and police service men. Moreover, various 'court cases' gathered from the British Archives strongly suggest that the government was aware of many cases of arms smuggling conducted by the 'Haganah'. Equally important is the revelation made by various reports to the effect that the government itself was active in militarising the 'Haganah' by placing arms in various settlements. See a CID report, dated December 1934, in FO 371/18975/E 1325.

During the Palestinian revolution of 1936-39, the 'Haganah' played an important role together with the British army and police in suppressing the anti-imperialist indigenous revolution. Only in the latter part of the 1930s and early 1940s, when it began to see itself as the foundation for an effective defence for a sovereign people and moved toward the institutionalisation of a 'shadow nation state' that this force began to assume certain degrees of independence from the British colonial power [Rayman 1981: 37-38].

During this period the 'Haganah' began to direct its attacks against both the indigenous Palestinians and the British government. It defied British policies stated in its 'White Paper' of 1937 partly by bringing illegal immigrants to Palestine and partly by 'stocking' illegal settlement [Criden and Glebb, 1974: 233, Tabenkin, 1985: 62]. Despite all this, however, it must be pointed out that during the late 1930s and early 1940s, the relationship between the British colonial government and the Zionist leadership in Palestine began to take a new course, and develop real conflicts, the understanding of which requires further research.

44 This argument was bluntly put by Harry Viteles, general manager, Central Bank of Co-operative Institutions in Palestine when he wrote:

The great aptitude of the Jewish mind for economic organisation, backed by a democratically moulded racial spirit and organised financial support naturally

and without political intent threatens the agricultural existence of this section of a great race whose social traditions are an obstruction on the road to economic independence which co-operation offers. See, Harry Viteles, 'Community Farming in Palestine in *Year Book of Agricultural Co-operation in the British Empire* (P S King and Son, London, 1936), p 134

Land Reform under Military

Agrarian Reform in Peru, 1969-78

R Maria Saleth

The issue of land reform postponed for decades in Peru was addressed by a relatively progressive military leadership during 1969-78 thanks to political pressure from radical peasant movements and the economic crises in agriculture. The reform has transferred 50 per cent of the total farm area to about 33 per cent of the rural families organised mostly under various forms of co-operatives to preserve agricultural productivity while effecting an unequal pattern of rural income distribution. Consequently, the tenurial changes effected under the reform was only minimal although there occurred fundamental changes in tenancy and other agrarian relations with the elimination of all remaining vestiges of the feudal-like hacienda system. Although the reform failed to solve the problems of landlessness, it can be considered a notable success in modernising the agrarian sector so as to create the necessary conditions for autonomous industrial development like the creation of market oriented and technologically responsive rural middle class, the transfer of agrarian capital into the industrial sector, and the conversion of former oligarchies and hacienda owners into industrial bourgeoisie by cutting their links with land.

I Introduction

THE land reform implemented in Peru during 1969-78 stands out as something different, if not unique, compared to both the land reforms of other Latin American countries as well as the earlier reform efforts undertaken in Peru in the early 1960s. While the radical land reforms of Mexico (1917), Bolivia (1950), and Cuba (1917) were the direct consequence of revolution, the land reforms of Venezuela (1960), Colombia (1961), and Brazil (1964) undertaken under the US sponsored Alliance for Progress programme were more land colonisation than land redistribution proper. The Chilean reform (1964) that subsequently became radical under the elected Marxist president Allende (1970-73) was completely reversed after his assassination in 1973. Like other Latin American countries, Peru also implemented two major land reforms during 1960-68 which aimed to pacify the peasants and depoliticise the issue of land reform. But, the highly organised peasant movements in Peru that resorted, at times, to *de facto* land reform like the one in 1962 kept alive the political pressure for a radical land reform. Also, the radical land reform during 1969-78 was most effectively implemented by a relatively progressive military leadership with very little political disturbance. Moreover, land reform formed an integral part of the military's comprehensive programme for the economic and political modernisation of Peru with a view to create the necessary conditions for autonomous industrial development supported by state capital. Given the assigned role for land reforms within the military's overall programme, land reforms were implemented with the major objective of modernising the traditional agrarian structure by creating a market oriented and technically responsive rural middle class capable of providing economic and political underpinning to indigenous industrialisation and moving land based agrarian capital to the industrial

sector. The main objective of this paper is to evaluate how far the land reform implemented under the military has succeeded in achieving its objectives within the context of earlier reform attempts and the magnitude of the agrarian problem in Peru.

II Agrarian Structure in Pre-Reform Peru: 1961

Table I indicates the problem of land concentration and land use pattern in Peru before the initiation of any significant land reform measures.¹ As of 1961, Peru had a total of 0.9 million agricultural units with a total farm area of 18.6 million hectares (ha). Of the total farm area, 89 per cent was under private ownership, 11 per cent was under the communal tenure, i.e., under some 4000 Indian communities sustaining about one fourth of the Peruvian population. The extremely polarised land distribution in the privately owned sector is indicated by the fact that the large farms representing just 0.2 per cent of the total number of holdings accounted for 68 per cent of the total farm area whereas the small farms representing 83 per cent of the total number of holdings accounted for a mere 6 per cent of the total farm area. The family and medium farms together representing 16 and 25 per cent of the total number of farms and total farm area respectively were relatively unimportant. About one third of the total area under communal tenure was individually operated by community members and the remaining area was collectively used mainly for pasturing cattle. Most of the larger holdings under the communal tenure were almost under collective use and the larger holdings individually operated by community members were often hilly tracts suitable only for grazing. With increasing population pressure on a fixed amount of communal land, the lands set aside for common use in many communities started disappearing due to their distribution among members for individual use. As a result, commonly used holdings

did not exist in more than 66 per cent of the communities [Bourque and Palmer, 1975, p. 204].

The extreme polarisation in the distribution of land had a direct bearing on land utilisation pattern characterised by over utilisation of land in small farms and under utilisation of land in large farms. Table I indicates clearly the strong inverse relationship between farm size and the proportion of farm area under cultivation. While small farms cultivated about 65 per cent of their farm area, the large farms cultivated only 6 per cent of their farm area. Also, while small holders devoted 72 per cent of their cultivated area to temporary and food crops, owners of larger farms devoted only 47 per cent of their cultivated area to temporary crops. Consequently, agricultural productivity stagnated due to declining land and labour productivity in small farms caused by soil erosion and exhaustion and lower land productivity in larger farms caused by under utilised land resources.

The agrarian structures evolved around a land tenure pattern dominated by *latifundio-minifundio* (large holding small holding) system displayed, however, marked qualitative variations across the three geographically and ecologically distinct areas of Peru, i.e., the *costa*, the Pacific coastal strip with arid climate requiring irrigation, the *sierra*, the mountainous region covering the Andean highlands, and the *selva* consisting of the eastern slope of the Andean mountain and humid Amazonian marshy low lands adjoining Colombia and Brazil. The modern export oriented, and highly capital intensive coastal system has specialised in the production of sugar, cotton and rice. The sugar zone accounting for the most fertile and irrigated land of the coast was dominated by modern sugar plantations and refineries worked by salaried workers and owned by landed corporations and foreign interests. On the other hand, the cotton zone was dominated by transitional *haciendas* (estates) with wage labour system. Family and medium farms and farms work-

ed by sharecroppers were common in the rice zone and also, to some extent, in the cotton zone. The Indian communities and traditional *haciendas* worked by service tenants² which characterised the agrarian structure of the *sierra* were virtually absent in the coastal system. Even though the highly productive coast accounted for 40 per cent of the national agricultural output, 75 per cent of the total agricultural credit, and 90 per cent of the total area under irrigation in 1968, the coastal system employed only 4 per cent of the total agricultural labour [Paige, 1975, p 128].

The traditional, subsistence-oriented, and labour-intensive *sierra* system produced mainly maize, potato, beans, fruits, and livestock. The *sierra* system presented the most complicated and iniquitous tenure pattern characterised by the domination of the feudal-like traditional *haciendas* owned mostly by absentee owners and worked by various kinds of service tenants. The ubiquitous presence of the land-starved Indian communities added yet another dimension to the iniquitous agrarian structure of *sierra*. Unlike the coastal agriculture, the production system of *sierra* was based more on the exploitation of labour than the utilisation of land thanks to the unlimited supply of cheap labour provided by the vast majority of landless and land-short peasants including the community members. However, capital intensive transitional *haciendas* with a wage-labour system were found in the advanced enclaves around the urban centres of the *sierra* region like Caja Marca and Arequipa as well as in the sugar and cattle zones of Huanuco department.

The isolated *selva* region representing the agricultural frontier of Peru has specialised in the production of coffee, coca, fruits, and forestry products. Even though the *selva* has vast land resource potential, less than 10 per cent of the land area in this region could be utilised in view of the ecological constraints and lack of dependable transport network to incorporate this region with the rest of Peru. Although the *selva* followed the same pattern of land concentration, the magnitude of inequality was relatively lesser here as compared to the other regions due to the presence of large number of medium and family farms fostered by the economic viability of family and medium farms in the production of fruits, coffee, and coca.

The agrarian structure in Peru was not conducive to balanced development of agriculture. Even though coastal agriculture was very productive, its external focus and meagre labour absorption prevented its effective integration with the national economy. The coastal system also became more and more vulnerable to the fluctuations in the international price of sugar. Broad-based industrial development was also stifled by both the demand and supply constraints created by the iniquitous and traditional agrarian structure. The most skewed distribution of rural income and the bi-polar social system engendered by the ex-

treme concentration of land did not permit the emergence of a dynamic rural middle class capable of providing both an expanding domestic market for industrial products as well as political underpinning to autonomous industrial development. The subsistence and unproductive nature of *sierra* agriculture was not responsive enough to meet the food and other agricultural needs of the urban areas and the resultant food shortage induced increasing food imports. Moreover, the rural problems of landlessness, unemployment, and poverty produced by the iniquitous agrarian structure especially in the *sierra* got themselves manifested in the urban centres due to distress migration representing almost 13 per cent of rural population [Barracrough, 1973, p 13]. In addition to economic problems, the Peruvian agrarian structure also created serious political problems challenging the status quo. While labour strikes and demonstrations organised by left-leaning labour unions dominated the coastal agriculture, the *sierra* remained an epicentre of violent peasant uprisings and a fertile ground for leftist and guerrilla activities.

III

Peasant Movements and Earlier Attempts

Although land reform measures were often met with stiff opposition from the ruling groups including the military, the intensity of rural unrest especially since the early 1950s forced the government to pass some kind of agrarian reform legislation. Given the prevalent political power structure, most of these efforts were make-believe in nature aiming at confusing the peasants. The first such effort was the creation of the Commission for Agrarian Reform and Housing in 1956 which submitted its report along with a draft agrarian reform law in 1960.³ Even though the commission's concern over productivity completely protected the coastal agriculture and its exemption and other loopholes left the *sierra* virtually intact, the Congress dominated by 'landed interests' totally rejected the draft reform programme and ratified instead a land colonisation programme. The Congress, however, approved the recommendations of the commission such as the earmarking of 3 per cent of national revenue for agrarian reform (i.e. colonisation) and legalisation of peasant and labour unions. Also, an initial administrative base was created with the establishment of National Institute of Agrarian Reform (NIAR) in 1959 and Agrarian Investigation and Promotion Service (AIPS) in 1960.

The draft reform programme of the commission did not, however, fail to signal the landowners especially in *sierra* to initiate parcelisation and decapitalisation of their estates. The resultant evictions of permanent workers, service tenants, and sharecroppers as well as the very deceptive nature of the 1960 law flared up a new wave of organised land invasions in *sierra* in which both

peasants and members of the Indian communities participated. For instance, in the La Convencion and Lares provinces of the Cuzco department, highly organised peasants led by Hugo Blanco, a syndicalist-turned-guerrilla, had successfully invaded and controlled 80 haciendas and implemented their own land redistribution.⁴ These invasions were also followed by general strikes by peasants⁵ of all the other haciendas in the two regions. Besides, other areas in *sierra* also witnessed spontaneous land invasions in which mostly members of those Indian communities with age-old land disputes with the neighbouring haciendas participated.

The elected president Manuel Prado could not pacify the peasants even after his presidential decree to abolish the practice of unpaid services. This large-scale rural insurgency was the major reason for the military coup that ousted president Prado in July 1962 [Nehemkis, 1964, p 93]. Having failed to quell the rebellious peasants and having sensed the possible escalation of land invasions in other areas of *sierra*, the military itself was compelled to pass a special Agrarian Reform Law 14444 in March 1963 applicable only to the La Convencion and Lares regions. What the special law did basically was to legalise the peasants' *de facto* control over the invaded lands by stipulating them to pay compensation extending over a period of 20 years. The junta also undertook politically prudent and strategically located colonisation projects through NIAR to augment its strategy of bringing a renewed social equilibrium in the violence-torn zones. Even though the special law also provided for expropriation, the land distribution through expropriation under this law was insignificant as only 260 out of the 16,000 landless peasants in the La Convencion region who applied for land actually received land [Petras and LaPorte, 1970, p 49].

Even though the special law did succeed in demobilising the peasant movements of the La Convencion and Lares regions, it signifies the powerful role of the Peruvian peasant movements in moving the political balance towards a direct land redistribution albeit at a regional level. The law did instigate further land invasions in other parts of *sierra* as the peasants were encouraged by the government's approval of the *de facto* reform in La Convencion and Lares. Thus, just before the 1964 election, there were 306 land invasions in which nearly 3,00,000 peasants and community members participated [Paige, 1975, p 165].

The escalating land invasions and rural unrest forced the newly elected president Belaunde Terry to pass the Agrarian Reform Law 15307 in 1964 applicable to the whole of Peru. The 1964 reform law provided for expropriation with compensation subject to a maximum exemption limit of 150 ha of irrigated land or 1,500 ha of dry land or pasture land. Since the law allowed maximum permissible exemption for each

member of the landed corporations, it effectively excluded all the coastal sugar and cotton estates as well as the modern and transitional estates of *sierra* from expropriation. Moreover, the compensation specified was very close to the market value of the expropriated land. Although the law attempted to give legal titles to the plots operated by the service tenants, sharecroppers, and permanent workers, it had, in practice, the opposite effect of large-scale evictions and intimidations as the law that specified penalty against the invading peasants did not specify any penalty against the evicting landlords.

In addition to the legal loopholes, there were also other built-in sabotage mechanisms that inhibited the effective implementation of even the limited expropriation provisions of the law. Since, the Agrarian Reform Council (ARC), the highest decision-making body regarding the financing and implementation of the reform programme, was dominated by landed interests, the Agrarian Reform Financing Corporation (ARFC) was deliberately left to starve for funds to carry out expropriation. For one thing, the actual sanction of funds never reached 3 per cent of the total national revenue as stipulated by the 1960 law and for another only 68 per cent of the amount sanctioned was ever realised by ARFC during 1964-68 and a substantial portion of the amount realised was diverted to colonisation projects [Edder, 1971, pp 217-18]. Further, the financial aid for agrarian reform promised under the Alliance for Progress never materialised as US law forbids financing the expropriation of private properties. As an inevitable outcome of the legal loopholes, and administrative and financial bottlenecks, the accomplishment of the 1964 law was only marginal.

Given that there were about 1 million landless and land-short families and assuming 6.5 ha per family in the coast and *sierra* and 30 ha in the *selva*, an effective land reform required the expropriation of at least 9.7 million ha. But, only 18 per cent of the projected minimum area to execute an effective reform was made expropriable by the 1964 law and just 0.8 per cent of the land required for an effective reform was actually expropriated as of 1968 [Petras and LaPorte, 1970, p 257]. Even though most of the reform finance was diverted to colonisation projects in the *selva*, these projects failed to make much dent on the problem of landlessness. Due to the longer gestation period and heavy financial and infrastructural requirements of the colonisation projects, the number of families settled during 1964-68 were only 1200 per annum [Dozier, 1969, pp 88 and 113]. By 1969, the law expropriated only 4 per cent of the total farm lands and benefited no more than 1 per cent of the rural families including those settled in colonised lands [World Bank, 1978, p 278]. The impact of the 1964 law on land tenure was negligible as the land ownership pattern that obtained in 1969 was not very

different from that found in 1961 by ICAD [Eckstein, 1983, pp 355-56].

IV Agrarian, Reform under Military, 1969-78

To cap the failure of president Belaunde Terry on the agrarian front, the *Acta del Talara*⁶ scandal occurred in 1968. Seizing this opportunity, the military under general Juan Velasco Alvarado staged a coup on October 3, 1968 and ousted president Belaunde Terry. This military coup is so unusual in the South American context because not only was it devoid of the usual post-coup political repressions but was also followed by a series of positive reform programmes. The Agrarian Reform Law 17716 of June 1969 formed an integral part of the junta's comprehensive reform programme for the economic and political modernisation of Peru. The main aim of the reform law was the elimination of the traditional system of excessively large and small holdings, concomitant promotion of commercially viable and technologically responsive family and medium sized farms with wage labour system, and group operation for large units where economies of scale would suffer from subdivision. The law aimed to create favourable conditions for autonomous industrial development by both helping to transfer the capital still tied with land, promoting an expanding rural market for industrial products, and enhancing marketable surplus especially of food crops.

Like the earlier reform laws, the 1969 agrarian reform law was also a law for the purchase and sale of lands on a long term basis. But, unlike the earlier laws, the new law was not only comprehensive and direct but also was packed with the much needed political determination to implement it effectively. The exemption limit specified by the 1969 law varied with regions and types of exploitation. For irrigated land, the exemption limit was 150 ha in the coast but only 15.55 ha in the *sierra* and in the case of dryland, the exemption limit was twice that allowed for irrigated land in both the regions. However, basic exemption could be

denied if the land in question was needed to meet the claim of the peasants and community members and also when the landowner did not comply with the labour laws.

The effectiveness of exemption provisions was, however, diluted by Article 181 of the law that allowed parcelisation on private initiative with the intention of both generating capital for industrialisation as well as to create commercially-oriented family and medium farms to enhance marketable surplus and promote rural market. However, due to mounting opposition from the evicted permanent workers of many parcelled haciendas especially in the *sierra*, the military later amended the parcelisation provision to require that each permanent worker of the estate should be assigned a family farm and then parcels of two to 15 family farms and one larger parcel within the legal minimum could be formed. The military also established penalty for the evicting landowners which was 50 per cent of the value of the expropriated land.

The amount of compensation and its mode of payment were also considerably rationalised under the new law. The compensation for expropriated land was determined simply on the basis of the value declared for tax purposes to catch the landowners in their own trap of undervaluation. However, higher compensation was allowed for the expropriation of properties below the legal minimum. While immediate cash compensation was paid for cattle and installations, the expropriated lands were largely paid by agrarian bonds carrying 3 per cent interest and redeemable over a period of 20 to 30 years. Even though the bonds were non-negotiable the law provided that if a landowner makes an investment in an approved industrial undertaking and supplies 50 per cent of that investment in cash, the Agricultural Development Bank would redeem his bonds on their face value to supply the remaining 50 per cent of the investment. This provision aimed to move both the cash payments for cattle and installations as well as the amount paid in agrarian bonds to the industrial sector.

In addition to Reform Law 17716 and its subsequent amendments, the junta also passed other supportive legislation having

TABLE 1 LAND TENURE AND LAND USE PATTERN PERU 1961

| Size Groups (ha) | Private Units | | Units under Indian Communities | | | | Land Use Pattern | |
|------------------|---------------|-------|--------------------------------|-------|----------------------------|-------|--|---|
| | Number | Area | Units under Cultivation | | Units under Collective Use | | Per Cent of Total Area under Cultivation | Per Cent of Cultivated Area under Temporary Crops |
| | | | Number | Area | Number | Area | | |
| Upto 5 | 83.3 | 6.1 | 82.2 | 10.0 | 0.0 | 0.0 | 64.4 | 72.7 |
| 6-99 | 15.4 | 10.6 | 16.1 | 15.9 | 50.4 | 1.0 | 44.4 | 48.1 |
| 100-999 | 1.1 | 14.8 | 1.6 | 33.2 | 26.0 | 4.9 | 15.8 | 58.2 |

| Total | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 13.7 | 53.6 |

Source: Barraclough [1973, Table 11.1, 11.11 and 11.12, pp 253, 255 and 277].

significant implications. The most important among them was Law 17752 which declared water as the national resource and created a body to plan for better utilisation of water resources. With this law, the military not only established a mechanism to deal with inter-regional water sharing conflicts but also eliminated the private control of streams and other water sources by hacienda owners. Law 19977 was promulgated to abolish sharecropping, leasing, and all other forms of indirect cultivation to eliminate exploitative agricultural contracts and absentee ownership of agricultural land. Law 19973 was passed to assure the non-expropriation of farms within the exemption limits and also to establish fiscal incentives to encourage family and medium farmers who directly cultivate their farms with wage-labour.

On the administrative side, the junta not only reorganised the NIAR and AIPS into the Directorate of Agrarian Reform (DRA) and Directorate of Agricultural Promotion and Cooperation (DAPC) but also placed military officials in every crucial executive position to see to the strict implementation of the reform programme. The ARC that sabotaged the implementation of the 1964 reform law was dissolved by the military immediately after the promulgation of the reform law. Regarding the financial aspect of the reform programme, while cash compensation for cattle and installations was paid through the Agricultural Development Bank, the ARFC was authorised to issue eight billion soles worth of agrarian bonds against its previous limit of six billion soles. The adjudication procedure based on a regional approach rather than the 'estate-to-estate' approach of the 1964 law was considerably simplified to expedite reform implementation. Under the new law, once a region was declared an agrarian reform zone, all farms above the legal minimum size automatically came under the purview of expropriation. To reduce the delay involved in legal battles, the military also established the Agrarian Tribunal to deal with any dispute concerning expropriation and compensation.

As a major departure from the past, the new law first affected coastal agriculture especially the sugar estates where the foreign influence was more.⁷ The immediate and sudden affectation of the coast not only created a pro-reform political climate but also provided very little time for the coastal oligarchy to solidify its opposition. Although some of the most productive estates in the *sierra* region were also affected immediately, the junta concentrated most of its effort in the first two years in transforming coastal agriculture. Each of the immediately affected estates both in the coast and *sierra* was transformed into an Agricultural Production Cooperative (APC). Under the APC arrangement, all the land and capital assets therein should not be split but be collectively owned by the clerical staff, technicians, and permanent workers of the transformed estate. However, the

workers were allowed to cultivate their own individual plots as existed before the reform. The profit of the cooperatives should be distributed among the members only after having paid the annual instalments towards compensation. All the APCs were placed under the general direction of the Advisory and Control System for the Agricultural Production Cooperatives. The sugar refineries and other processing units which were not affected immediately were nationalised subsequently in view of their indivisibility with the sugar plantations. The sugar-based APCs were organised under a separate system known as the Sugar Cooperatives of Peru to better coordinate sugar production. While the sugar zone was completely transformed into APCs, the coastal cotton and rice zones dominated by family and medium farms were not affected much by the 1969 law except for the parcelisation of large transitional estates and limited cooperativisation attempts of a few large cotton estates.

Despite the immediate expropriation of the modern cattle and sheep ranges in Junin and around the lake Titica, the main focus of the law in the *sierra* region could be seen only after two years. This strategic delay provided substantial time for the owners of large estates to quickly carry out parcelisation and decapitalisation. Since the parcelisation provision was modified only by the end of 1971, the landowners parcelled out their estates before 1971, escaped the modified provision requiring the assignment of family farms to their permanent workers. One exception to this was the Canete valley where stiff opposition from the permanent workers forced the military to annul all parcelisation carried out in this region after the promulgation of the 1969 law. While the military transformed the most modern estates into APCs, the traditional and transitional estates were transformed into another cooperative form known as Agricultural Society of Social Interest (ASSI).⁸ The ASSIs were organised as follows. The former permanent workers or the service tenants of the transformed hacienda formed a service cooperative. They could, however, retain the independent cultivation of their small plots as in the pre-reform period. Along with these workers who actually work the estate, each adjoining community entered as a single member into the ASSI. Thus, the members of ASSIs are not individual workers but an association of workers and the adjoining communities. It was specified that each community should be given 5-82 per cent of the divisible income of the ASSI and that amount should not be distributed but only be utilised for investment in community development projects. The idea behind the incorporation of the Indian communities into the ASSIs was to eliminate their age-old land disputes with the transformed estates.

In an effort to address the problem of uneconomic and fragmented landholding system within the Indian communities, the

new law also tried to extend the cooperative concept to all the recognised Indian communities. The law provided for the transformation of the communities into cooperatives managed by the elected members of the Administrative and Control Board in each community. The law established that only those members who obtain the major portion of their income either from cultivation or from employment within the community could qualify for community membership. The aim of this provision was to enhance the land per capita to the members by eliminating those members obtaining the major part of their income from urban and industrial employment. Even though the communities were accustomed to the concept of co-operation, the time and the manner in which the reform was implemented in the Indian communities produced more violence and conflict rather than co-operation among the members. The traditional co-operative tendency in the Indian communities was seriously eroded due to the ongoing penetration of capitalism as well as the absence of commonly used lands in most of the communities. This was especially so in the crop producing regions of *sierra* where the Indian communities appeared very much like a group of independent holders. Moreover, the qualification established by the law for community membership was met with violent opposition from the most prosperous members of many communities. Despite the superficial nature of the reform with respect to the Indian communities, a number of Indian communities without commonly held lands were organised under another form of land tenure system known as 'peasant groups'.

Even though the reform programme was a 'reform from above' implemented in an essentially non-bargaining political climate, the implementation of the reform was not, however, smooth. The military was subjected to political pressures both from the workers, peasants, and landowners. The response of the military ranged from outright oppression to quick yielding to pressure. The workers of the sugar estates who were initially caught by the revolutionary image of the reform programme resorted to strikes and demonstrations when they realised that their share was affected by the annual instalment payments and their secondary role due to domination of technicians and clerical staff in decision making. Although the military's initial response was the ban on strikes and demonstrations and arrest of violating workers, the tenacity of the workers forced the military to subsequently raise their wages. The military responded to the violent opposition from the evicted permanent workers of the haciendas by modifying the original parcelisation provision aimed to benefit the landowners. Yielding to political pressure from the landowners, the military established the Agrarian Tribunal and allowed landowners to settle their expropriation and compensation disputes. While the military passed a legislation to assure the

non-expropriation of farms below the legal minimum employing waged labourers, it also passed legislation requiring such farms to distribute 50 per cent of their divisible income among the workers.

Violent land invasions also occurred in *sierra* carried out by landless rural groups such as temporary and casual agricultural workers of the estates. This was due to the nature of the new law that benefited only those who had some kind of access to the hacienda land either as service tenants or permanent workers or sharecroppers but excluded those who did not have that access. The most outstanding case among the 80 land invasions reported after 1969 was the one that occurred in Andahuaylas where 20,000 peasants invaded some 50,000 ha prompting the military to kill 20 peasants in its effort to crush the rebellion [Monahan, 1975]. These land invasions forced the military to devise new schemes to benefit the hitherto neglected rural landless groups. The result was the creation of the Integral Rural Settlement Projects (PAIRs) and Integral Development Projects (PIDs) to incorporate the hitherto neglected groups into the reform process. These regional structures comprising the ASSIs and APCs of a given geographic region were aimed to transfer at least a part of the profit of the cooperatives to the temporary workers and other landless rural groups in an indirect way. However, the military's attempt to create regional cooperatives were met with severe opposition from the members of both the ASSIs and APCs. In addition to these efforts, the military also speeded up its land colonisation programmes in the *selva* to settle the landless families not benefited so far.

The junta headed by Velasco Alvarado that carried out 91 per cent of the total land expropriated during 1962-80 was viewed as too responsive to the pressures from below [Alberts, 1983, p 267]. Fearing that the reform process would go beyond the originally planned limit, the physically indisposed general Velasco Alvarado was ousted by a relatively conservative general Morales Bermudes in a coup in 1975. With the change in political leadership, the land reform programme lost its dynamism. The area adjudicated during the 1976-78 period was essentially from land expropriation initiated by the earlier regime or from land colonisation.

V

Evaluation of 1969 Agrarian Reform

While Peru had an estimated 7,00,000 landless families by 1969, the new law envisaged an initial target of adjudicating 11.4 million ha of land and benefiting 2,42,088 by 1975 [USAID, 1969, p 140]. Table 2 shows the progress of agrarian reform during 1969-78. Since the military concentrated its effort in the coast and the most modern segments of the *sierra* in the initial period, over 65 per cent of the families that

benefited during 1969-73 were those of the permanent workers, technicians, clerical staff of the sugar estates in the coast and livestock enterprises in *sierra*. The beneficiaries during 1969-73 also included some 26,188 families settled in 582,000 ha of colonised land in the *selva*. When the focus of reform shifted to *sierra*, there was an acceleration both in the area adjudicated and families benefited partly through land expropriation and partly through parcelisation. However, the sharp acceleration tendency after 1975 was mainly due to the inclusion of communities and groups of small holders who were simply organised under some form of superficial regional co-operatives. Since land expropriation was brought to a halt after 1975, the lands adjudicated during 1976-78 were mainly from colonisation or land expropriation initiated during 1974-75. However, colonised lands represented only 10 per cent of the total land adjudicated during 1969-78 and the rest of the area was from land expropriation.

Since more families were accommodated with reduced expropriation, the average area

adjudicated per family declined from 66 ha during 1969-70 to 22 ha during 1976-78. However, the extent of reform benefit varied markedly between regions, mode of adjudication, and enterprises within each region and adjudication mode. This is evident in Table 3 showing the institutional breakdown of the reform sector as of 1978. The dominant trend in adjudication was towards co-operative and other associative forms of ownership like peasant groups rather than individual ownership. Of the total 7.4 million ha of land adjudicated under the reform, 37 per cent was accounted by the ASSIs, 29 per cent by the APCs, and 21 per cent by the peasant groups. Even though ASSIs had a higher share in the adjudicated land as compared to the APCs, the former had a lower share both in terms of total beneficiaries as well as total value of adjudications as compared to the latter. This is due to the fact that while the lands assigned to the ASSIs are of poor quality suitable mostly for extensive cultivation, lands assigned under the APCs are highly capitalised and irrigated. For instance, the

APCs accounted for 77 per cent of the total value of adjudications as against the poor share of 14 per cent by the ASSIs. Within the APCs, those located on the coast accounted for 71 per cent of the total value as against only 6 per cent by the APCs located both in the *sierra* and *selva* regions.

While both types of co-operatives in the *sierra* together accounting for 53 per cent of the adjudicated land had only 19 per cent of the total value of adjudication and 26 per cent of the beneficiaries, the coastal co-operatives with only 11 per cent of the total land adjudicated and 29 per cent of the beneficiaries accounted for 75 per cent of the total adjudicated value. Obviously, the peasant groups, communities and individuals are only marginally benefited with just 9 per cent of the total value of adjudications under the reform. The most notable aspect in Table 3 is that the Indian communities with just 10 per cent of the adjudicated area and 2 per cent of the adjudicated value accounted for one-third of the reform beneficiaries. The Indian communities who benefited from both land distribution as well as from their membership in ASSIs represented only 10 per cent of the total communities in Peru. Also, the individual adjudication covers not only the sharecroppers but also the members of the co-operatives received title for the small plots they cultivated in the pre-reform period.

Overall, the reform has benefited roughly 33 per cent of the rural families with 50 per cent of the agricultural land. Most of the reform beneficiaries were essentially those who already had some kind of direct access to land in the pre-reform period. The reform did not benefit the holders of uneconomic and fragmented units known as *parcelarios* and the landless labourers representing roughly 40 per cent of the rural families and the 50,000 sharecroppers who benefited from the reform represented just 5 per cent of the rural families [Rojas, 1978]. The regional co-operatives attempted by the military to benefit the hitherto neglected groups in the *sierra* actually turned out to be a political ploy to pacify the landless rural groups as very few co-operatives of the *sierra* had any substantial divisible income. Despite the poor show of the reform in terms of its inability to solve the problem of landlessness and its unequal impact across regions and rural social groups, the reform programme has definitely produced significant qualitative changes in the agrarian sector. The impact of the 1969 agrarian reform can be evaluated on the following counts.

CHANGES IN AGRARIAN STRUCTURE

Regarding the tenurial changes, Table 4 clearly shows that only the large farms were reduced both in numbers as well as in area. On the other hand, the family and medium farms, though reduced in numbers, had more or less the same area as before. This can be expected in view of the objective of the law to promote family and medium

farms both by exempting from expropriation those which already existed before the reform but also creating more of them through parcelisation. Notably, although the small holding declined in numbers, it had the same share in the total farm area. While the average size of the small and family holdings remained the same, the average farm size in the medium and large category has declined substantially after the reform. The major impact of the reform on land tenure pattern has been the transfer of the area under the large farms into the reform sector dominated by group operation. The group operation was designed to resolve the conflicting objective of effecting land distribution while maintaining land concentration.

The tenurial changes that occurred seem to be more conceptual and institutional rather than structural in nature. This is because the co-operative systems were simply superimposed on the former hacienda system and the conversion of service tenants and sharecroppers into the owners of the small plots actually perpetuated the problem of uneconomic and fragmented holdings. The most important factor that produced a significant impact on the problem of land concentration has been the parcelisation of large estates with the attendant emergence of family and medium farms. However, no one can deny the fundamental changes engendered by the reform in the realm of agrarian relations. The co-operativisation, parcelisation, and the conversion of service tenants into owners have all resulted in the complete liquidation of the hacienda social system along with the elimination of unpaid labour and other exploitative agrarian contracts as well as absentee ownership. In the coastal system, the reform has effectively

eliminated not only the land ownership by landed corporations and foreign interests but also the practice of sharecropping, leasing, and other forms of indirect cultivation. Despite the co-operativisation of the sugar zone, the private character of agriculture was fully maintained in the cotton and rice zones of the coastal area. Moreover, the impact of the reform on the communal tenure structure was only superficial in nature as there was not any restructuring of community land.

The post-reform agrarian structure in Peru was dominated by the agrarian co-operatives and the group of small, family, and medium farms owned and operated directly by the former service tenants, permanent workers, and the former hacienda owners with the wage-labour system. Although the wage-labour system replaced the earlier exploitative system of unpaid labour, it is not going to solve the problems of agricultural workers as the agricultural wage is bound to be depressed by the higher farm labour supply potential represented by the landless rural groups as well as the land-short community members not benefited under the reform.

DISTRIBUTIVE EFFECTS

The income redistribution profile can be studied both in its vertical (within each productive sector) and horizontal (between productive sectors) dimensions. Despite the compensation payment that reduced the vertical income distribution potential of the reform, substantial vertical distribution of income did occur thanks to the fact that compensation was in most cases far less than the market value of the adjudicated lands. Moreover, in view of perennial hyperinflation witnessed in post reform Peru, the

effect of compensation payment on the long-run vertical distribution profile will be negligible.⁹ However, the pattern of income distribution varied considerably between different groups within the reform sector (see Table 3). While members of co-operatives benefited more than others, within the co-operatives, it is the members of the APCs who benefited more as compared to the members of the ASSIs. Again, within the APCs, the members of the 12 agro-industrial APCs located in the coast benefited more as compared to those of other APCs. The members of the communal holdings benefited only indirectly through their membership of the ASSIs most of which had very low divisible income. Overall, the land reform has benefited only the upper three quartile of the rural society but virtually neglected the lowest quartile consisting of landless labourers and Indian community members [Webb, 1983, pp 103-105]. That is, the reform has segmented the rural sector by a deliberate strategy of unequal distribution of reform benefits so that the income effects of the reform is not diluted. This is not surprising in view of the reform objective of creating a market oriented rural middle class.

Although compensation payment reduced the potential for vertical income distribution, nevertheless, it facilitated horizontal income distribution. The land based agrarian capital released by the reform of 11.1 billion soles has already found its way into the industrial sector due to the combined effect of a variety of factors. The provision of the law for the immediate redemption of agrarian bonds due to inflation have provided an excellent condition for the quick transfer of the agrarian capital to the industrial sector. From a short-run perspective, the agricultural development programmes implemented in the wake of the reform brought substantial capital into the agricultural sector especially in the form of agricultural credit and investment in irrigation schemes. For instance, the amount of agricultural loans has increased from 2.8 billion soles in 1968 to 30.9 billion soles in 1977 signifying almost 11 times increase [CISE, 1981, p 19]. However, the allocation of funds within the agricultural sector still favours the dominant rural groups and regions. For instance, even after the reform, the share of the small and family farms was just 6 per cent of the total institutional credit [de Janvry and Saddoulat, 1989]. Similarly the coast still monopolises the irrigation investment as this region accounted for almost all of the 6,00,000 ha of additional land brought under irrigation after 1969 [FAO, 1987].

EFFECTS ON PRODUCTION AND PRODUCTIVITY

Even though intervening factors like climatic failures and the unavailability of consistent and comparable data preclude any conclusive analysis in this respect, it is,

nevertheless, possible to broadly indicate the effect of the reform on agricultural production and productivity. The average growth rate of crop farming, livestock, and forestry sub-sectors rose to 2.4 per cent during 1970-75 as against 1.5 per cent during 1965-69 [United Nations, 1975, p 329]. Food production continued to improve even after 1975 as the food production index (base = 1979=81) has increased from 106 in 1975 to 130 in 1986 [FAO, 1987]. Even though the index of cotton production declined continuously the index of sugar production (base = 1965=69) rose to 111.5 during 1975=76 [Thorp 1975, p 43]. The outstanding case of dramatic increase in production was rice which was imported till 1970, not only was self sufficiency achieved but also surplus for export was produced. This was achieved partly through a favourable price policy and partly through a government policy of directing the co-operative members to devote their entire individual plots and the cotton farmers to allocate 40 per cent of their farm area to food crops.

Substantial gains in productivity of both food and commercial crops were also achieved in the post reform period. The overall productivity of cereals as a group has increased from 1.551 kg/ha during 1962-64 to 2.674 kg/ha during 1982-84 which was also the highest in South America [FAO, 1987]. Moreover the average productivity of sugar rose from 144.8 metric tons in 1965 to 171.4 metric tons by 1974 [United Nations, 1975, p 319]. Peruvian agriculture also saw a favourable shift in crop pattern as the area under maize and rice increased while that of potato and cotton declined. However, improvement in the productivity of potato and cotton has more than compensated the decline in area under these crops as their total output has either remained the same or improved. The productivity levels of cotton and potato have also been the highest in South America [FAO, 1987].

More importantly, the structure of post reform agricultural output has witnessed a remarkable change to favour the urban and domestic industrial needs rather than the export sector. Table 5 gives the structure of agricultural output and employment as of 1981. It is obvious that 80 per cent of the total output is marketed suggesting the favourable effect of the reform on marketable surplus. Notably the urban sector accounted for 53 per cent of the agricultural output as against only 27 per cent by the export sector. The medium farms dominated not only in terms of their share in total output but also in marketable surplus. Similarly the co-operatives accounting for 27 per cent of the total output marketed almost 94 per cent of their share. On the other hand small farms with 30 per cent of the agricultural output spent almost two thirds of their share for subsistence. However in terms of farm employment, the small farms provided employment to over 60 per cent of the farm labour force. Table

5 clearly shows that the agricultural sector dominated by the highly productive medium farms and co-operatives has focused more on the domestic market in the post-reform period rather than the export sector as was the case before the reform.

VI Conclusion

The Peruvian agrarian reform implemented by the military during 1969-78 can be considered a definite success in terms of its major objectives. Although it is a reform-from-above conditioned often by forces from below, the military never sacrificed the major objectives although they were compromised at times. The agrarian sector has been reorganised and modernised without sacrificing productivity while effecting a moderate but unequal income distribution pattern. The agrarian modernisation undertaken by the reform also tailored the rural class structure conducive for autonomous industrialisation. Through a judicious policy of co-operativisation, parcelisation, and the conversion of sharecroppers into owners, the reform has promoted a rural middle class capable of providing both an expanding rural market for consumer goods and an increasing agricultural surplus to the urban sector. The reform has succeeded not only in moving agrarian capital into the industrial sector but also in converting the coastal oligarchies and the hacienda owners of the sierra into an industrial bourgeoisie by cutting their links with land. More importantly, the agrarian reform implemented by the military represents the first ever successful attempt made in the history of Peru to systematically and structurally integrate the agricultural and industrial sectors. Despite its favourable effects, the reform has failed to solve the problem of landlessness in Peru. The reform programme that benefited only the relatively mobilised and prosperous rural groups with some kind of access to land in the pre reform period has effectively excluded a majority of rural population consisting of landless labourers, the owners of uneconomic and fragmented holdings and the land short members of Indian communities. Thus, it seems that the reform that has finalised the demarcation of right over land has opened up the flood-gate of rural urban migration. Given the demographic pressure and a relatively limited level of employment potential in the co-operatives and medium farms as well as the slow growth of industrial employment, the *de facto* wage rate will tend to be depressed by the excessive supply of farm labour contributing thereby to rural poverty and unemployment. Even though Peru is currently utilising only 3 per cent of its national territory for agricultural purpose as against the arable land resource potential of 27 per cent of the national territory, the problem of landlessness cannot be expected to be solved through land colonisation due to the

budgetary, logistic, and ecological limitations. Land colonisation policy can be only a supplement to a well-conceived policy of increasing rural employment through public investment in irrigation and transport as well as agricultural extension and credit policies. Therefore, the durability of the agrarian reform programme depends ultimately on the nature and magnitude of effects of the reform programme on the general process of economic development

Notes

[The author is grateful for the useful comments and suggestions received from R Narayana and Folke Döving on an earlier version of this paper.]

- 1 This is based on the sample survey data collected by the Inter-American Committee for Agricultural Development (ICAD) during 1961. To this day, the ICAD data remains the most comprehensive and oft quoted source for any study on land tenure in Peru and other Latin American Countries.
- 2 The service tenants in the context of Peru and other Latin American countries are essentially peasants-cum-labourers. These tenants known variously as *feudatarios* or *colonos* or *vanaconos* have to provide 160 days of work in the landlord's estate along with additional unpaid services if required to the landlord in return for the right to cultivate a small plot of land located either within or outside the estate.
- 3 For an evaluation of this draft reform law, see Cohen [1964].
- 4 For a detailed account of the peasant movements in Peru, see Blanco [1972].
- 5 In the Peruvian context, peasant's strike means their refusal to pay the unpaid service to the hacienda owner.
- 6 An agreement between Belaunde's government and International Petroleum Company (IPC) which is highly pernicious to Peruvian national interest. But it was later annulled when IPC was nationalised by the military government.
- 7 The shares owned by foreign private interests in some of the expropriated sugar enterprises were as follows: Cartavio (99.99 per cent), Paramonga (99.85 per cent), Nepena (96.21 per cent), Casa Grande (73.51 per cent), Tuman (60.81 per cent), and Laredo (49.67 per cent). See United Nations [1976, p. 113].
- 8 The major factor distinguishing an ASSI from an APC is the presence of the Indian communities as members in the former. For instance, 16 ASSIs created in Puno were later changed into APCs as they did not have any community members.
- 9 The average annual growth rate of the consumer price index has been 33.5 per cent during 1970-81 [see World Bank, 1984, pp. 144-45].

Economic Ironies in World Politics

A Sequel to Political Ironies in World Economy

Andre Gunder Frank

This essay shows how in the short run today world economic conditions limit the discretion of, and produce unintended consequences from, political policy. These economic conditions are largely beyond anyone's control, but they have far-reaching effects on apparently autonomous political policies and social movements around the world. Uncontrollable world economic constraints and exigencies ironically subvert well and not so well intentioned political action all around the world. Their combination results in unhappy consequences for the peoples of the world.

This thesis is illustrated here by examining the present transition from socialism to capitalism in the east, the underdevelopment of development in the south, the political economic conflicts among the western powers, and the tragic ironies in the Gulf War. Unfortunately, this kind of economic determinism/reductionism is not popular in any of these places, but, equally unfortunately, it is realistic for all of them.

EARLIER POLITICAL IRONIES IN THE WORLD ECONOMY

RECENT history has borne out the theses which were advanced in my previous and complementary essay entitled 'Political Ironies in the World Economy' [Frank 1984, 1987]. Then, I maintained that in the long run since 1945 world economic conditions were shaping international and national politics and social movements. In particular, I argued that the economic conflicts and opportunities generated by the world economic crisis since 1967 would prove to be more important in shaping international relations and domestic policy than the ideological and political cold war between the United States and the Soviet Union. Moreover, I argued that many east-west conflicts were a sham and largely a cover for the always real north-south contradictions. I argued that none of the 14 'revolutions' in the south since 1974 was what it appeared to be or would turn out as was hoped or feared.

These observations among others suggest the further irony that much of the east-west conflict, especially between Washington and Moscow, is a smoke screen cover for north-south conflicts. The world economic and technological development that is now passing through a crisis of regeneration, is perhaps, again ironically, likely further to diminish if not eliminate the importance of the east-west political division of the world much more than the north-south economic division, which it is likely to accentuate still further [Frank 1984, 1987].

I also suggested that this inefficacy of 'voluntarist' state policy and politics, especially for 'national development' in a world economy, was the basis for the rise to greater importance of alternative social movements in the west, south and also in the east. Under the title *The European Challenge* [Frank 1983, 1984], I also argued that world economic conflicts made greater 'Pan-European Entente' both politically possible and desirable, as a least worst policy. In the meantime, all of these and related analyses and forecasts, which seemed unrealistic in the ideological climate of their time,

have become hard reality.

In the 1980s, political economic policies took unexpected ironical turns and have had or will have unintended ironical consequences. That is, they are ironical if viewed through the orthodox and even heterodox ideological prisms, which were then still dominant in the west, south and east. However, these 'ironical' turns and consequences are only logical repercussions of the changing world economic conditions. Now the cold war is over, and Germany and Japan have won!

The most spectacular turn is the end of the cold war and the dramatic transformations in eastern Europe and the Soviet Union. Hindsight theorists have since then attributed these changes to all manner of objective and subjective 'causes'. The world economic background of these political changes has, however, received far less attention in theory than it deserves in fact. The world economic crisis and particularly the severe recession from 1973 to 1975 prompted the west into anti-cyclical lending policies, which converted much of the south and east into ever more dependent debtors. The renewed severe recession of 1979 to 1982 then sparked the debt crisis, which erupted in Poland in 1981 and in Argentina and Mexico in 1982. The same recession also severely compromised the American and Soviet economies; the latter in particular through the decline in the world price for its exports of oil and gold.

Reaganomics or neo-conservatism (neo-liberalism in Spanish terminology) and the long cyclical recovery in the west since 1983 masked the continued development of the long economic crisis, particularly in the south and east, but also in the United States. Gross national product and per capita national income declined or stagnated in much of the now excessively debt-burdened south and east. By 1990 average per capita income in Latin America had declined by 13 per cent back to the level of the mid-1970s. In Africa, it fell back over 25 per cent to the pre-independence levels of 1960. The economies of eastern Europe and of the Soviet Union under the Brezhnev regime also stagnated or

declined. All of these completely missed the train of international economic competition and were left to vegetate on a siding, while the world economic express train rushed by on the main track.

However, if the American economy was still on track at all it was also running on steam relative to its rivals in western Europe and east Asia. Or at least, America was no longer able to generate its own steam at home. The United States ceased being the world's largest creditor in 1985 and became its largest foreign debtor instead. Ever more foreign borrowing became necessary on account of the foreign trade deficit, which in turn was generated at least in part by the growing domestic budget deficit. This growing budget deficit, its cumulation, and the resulting more than duplication of the national debt from less than 1 trillion to more than 2 trillion dollars (after President Reagan had promised to eliminate the first trillion) were in turn due primarily to the Reagan administration's vastly expanded military expenditures. Ideological get-government-off-our-backs monetarist/supply-side Reaganomics turned out to practise militar Keynesianism with money borrowed from the Europeans and the Japanese! One purpose was to keep the economy or at least its military sector afloat and to redistribute income from poor to rich at home, which succeeded on borrowed money and time.

The other purpose was to make 'America Number One Again' abroad, and that failed miserably. True, this Reaganesque 'Star Wars' policy and practice did indeed bankrupt the economically already weakened Soviet Union. However, it also nearly bankrupted the United States. Its legacy may still drive the American economy completely into the ground in the new recession, which started in 1990.

RECENT ECONOMIC IRRELEVANCE OF POLITICAL IDEOLOGY

Thus, the most important international and national economic and political policies adopted and implemented around the world

during the 1980s were often contrary to the 'dominant' ideologies. These in turn were largely irrelevant to the necessary political economic responses to world economic conditions beyond anyone's control. In my review of the revolutions in eastern Europe in 1989 [Frank 1990a] and in my answer to Francis Fukuyama [Frank 1990b], I sought to demonstrate that his ideological thesis that "in the long run ideology wins out over the material world" was belied by material reality. The latter proved the opposite in recent years—and threatens to do so again in the coming ones.

—In the 1970s, the same export/import led growth strategies were adopted by communist party led governments in the east (Poland, Romania, Hungary) and military dictatorships in the south (Argentina, Brazil, Chile).

—In the 1980s, the same debt service policies on the IMF model were adopted and implemented by communist party led governments in the east (Poland, Hungary, Romania, Yugoslavia) and by military dictatorships, other authoritarian governments, and their successor democratic governments in the south (Argentina, Brazil, Mexico, Philippines).

—There were variations on the theme of debt service, but it is difficult to correlate, let alone explain, them by reference to the political colour or ideologies of regimes or governments. The most stellar pupil of the IMF was Nicolae Ceausescu in Romania, who actually reduced the debt until the lights went out, first for his people and then for himself. In Peru, on the other hand, the newly elected president Alan Garcia defied the IMF and announced he would limit debt service to no more than 10 per cent of export earnings. Actually, they were less than that before he assumed office. Then, they rose to more than 10 per cent under his presidency. Real income fell by about half, and the novelist Vargas Llosa sought to succeed to the presidency after moving from the political centre left to the extreme right. But what does that mean, if anything?

—Communist general Jaruzelski in Poland and the populist Sandinistas in Nicaragua also implemented IMF style adjustment and 'conditionality' on their people. Both did so *without* the benefit of pressure from the IMF, since Poland was not a member and Nicaragua had no access to it. In Nicaragua, there was *condicionalidad sin fondo*, that is conditionality without the fund and without any bottom or end to the Sisyphean policy. Hungary had the most reformed economy and the most liberal political policy still led by a communist party in the Warsaw Pact. Yet Hungary paid off the early 1980s principal of its debt three times over—and meanwhile doubled the amount still owed! That is more than Poland or Brazil or Mexico which on the average paid off the amount of debt owed only once or twice, while at the same time increasing its total only two times. No matter, the Solidarnosc government that replaced general Jaruzelski and the communist party

in Poland now benefits from IMF membership and imposes even more severe economic sacrifices on its population than its predecessors. In Hungary's first free election, all parties promised to follow the IMF prescriptions after the election.

—Moreover, the western IMF and its policies were the 'secret weapon' and 'de facto ally' of the opposition groups. They are now in power or making their bid for it thanks primarily to economic and secondarily to the political crisis, which was engendered by the implementation of these austerity 'adjustment' policies with IMF support. So now there is not only no economic but also no political alternative to further austerity policies, which are tied to IMF and other western advice and conditions.

—The political irony is that 'really existing socialism' failed not least because of the unsuccessful implementation of import/export led growth models and IMF style austerity policies in the east. Yet 'really existing capitalism' pursued the same models and policies in the south and also failed. However, nobody in the west or east says so, and nobody in the south any longer has a plausible 'socialist alternative' to offer. Why was there a 'change of system' in (part of) the east in the face of failure, but none in the south in the face of the same failure? Jeanne Kirkpatrick was wrong when she said that 'totalitarian' countries in the east do not change, while 'authoritarian' ones in the west do. Actually, it is arguable whether in either case there was any 'change of system' or an 'end of history'.

—The economic crisis has been expanding and deepening in eastern Europe and the Soviet Union. The economic crisis and related economic factors contributed materially to the desire and ability of these social (and also ethnic/nationalist) movements to mobilise so many people at this time for such far reaching political ends. The decade of the 1980s, indeed beginning in the mid 1970s, is now called 'the period of stagnation' in the Soviet Union and generated accelerating economic crisis and absolute deterioration of living standards in most of eastern Europe (as also in Latin America, Africa and some other parts of the world [Frank 1988]). Significantly especially in eastern Europe, this period also spelled an important deterioration and retrocession in its relative competitive standing and standards of living compared to western Europe and, even to the newly industrialising countries (NICs) in east Asia.

Moreover, the course and (mis)management of the economic crisis generated shifts in positions of dominance or privilege and dependency or exploitation among countries, sectors, and different social, including gender and ethnic groups within the Soviet Union and eastern Europe. All of these economic changes and pressures generated or fuelled social discontent, demands, and mobilisation, which express themselves through enlivened social (and ethnic/nationalist) movements—with a variety of

similarities and differences among them. It is well known that economically based resentment is fed by the loss of 'accustomed' absolute standards of living as a whole or in particular items and by related relative shifts in economic welfare among population groups. Most economic crises are polarising, further enriching, relatively if not also absolutely, the better off, and further impoverishing both relatively and absolutely those who were already worse off, including especially women.

Thus, the momentous economic and political changes of perestroika and glasnost in the Soviet Union and eastern Europe and therewith the end of the cold war did not simply emerge, like Pallas Athene out of Zeus, from the head of Michael Gorbachev. He said himself that they were 'inevitable'. As (economic) necessity is the mother of (political) invention, had Gorbachev himself not existed, he would have had to be invented. His pragmatic praxis outpaces and overturns ideological preconceptions, including his own and those of his opponents at home and abroad. The exigencies of the world economy generated all manner of pragmatic praxis and political ironies in the 1980s.

NEW ECONOMIC IRONIES IN EASTERN EUROPE AND THE SOVIET UNION

However now in the 1990s, even the most pragmatic political policy and practice are subject to limitations and to the subversion of their intended consequences by world economic ironies.

Soviet perestroika and east European privatisation are destroying old forms of economic organisation before and much faster than they are replacing them with new ones. In particular, the Soviet Union made the serious mistake of starting perestroika where it is most difficult in industry and trade instead of in agriculture. There on the Chinese model (albeit less so) the beginning of privatisation could have increased food supplies to the cities and built up political capital for Gorbachev. Both the Soviet Union and especially eastern Europe began by marketising the industrial and commercial state monopolies and permitting them large measures of private monopoly power instead. The result is, of course, that they raise prices to consumers and intermediaries. At the same time, the state ran the money printing presses faster and faster to cover its growing deficits, including those generated by higher purchase prices from and support subsidies to these enterprises. The result had to be a breakdown of the supply system and runaway inflation. Instead of serving the consumer—not to mention the worker—better, liberalisation ironically brought the economy to grind to a screeching halt.

However, perhaps the biggest irony is that the 'transition from socialism to capitalism' is taking place just when another severe recession in the world economy is helping to pull eastern Europe and the Soviet Union

even deeper into depression. Therefore, the celebrations of the revolution of 1989 as liberation in the east and victory in the west may be premature. Marketisation through perestroika and glasnost in the Soviet Union and privatisation and democracy in eastern Europe was supposed to offer their peoples some of the benefits (although also some of the costs and discipline) of the freedom of the market = democracy in the west. East Europeans sought to become like west Europeans, and the Soviet people sought at least to join western civilisation. The transition would be unsettling, and better or worse domestic policy could smoothen or roughen the transition. Many people hoped and some still do that the more they reject old ideological ways and replace them with Reaganomic and Thatcherist ideology and practice, the better the policy and the faster and smoother the transition.

THE SHORT TERM

However, the short term economic irony is that the transition is accelerating economic decline in the east. Moreover, in world economic terms this transition in the east is being promoted at the worst possible time: the world economy is falling into severe recession again in the west, which exacerbates the difficulties of transition in the east. In 1990 already production declined an average of 20 per cent and spelled severe depression and galloping inflation in the east. This inflation is measured in terms of the national currencies, which become worthless. Accordingly, these economies are being 'dollarised' or 'D-markised'. Therefore, the real market value of their properties and goods is suffering a classical and severe deflation in terms of these world currencies. (Ironically the dollar is increasingly valued only in the socialist or ex-socialist east and the underdeveloping south, while it is declining in value on the world market.)

Unemployment is ravaging the population in the ex-east, which has no unemployment insurance, because previously the old ideology and full employment made it unnecessary, and now the new ideology and bankruptcy make it impossible. In Germany, politically accelerated unification deepens the depression and aggravates unemployment of already nearly two and a half million in the east. Ironically also, unification was accelerated to avoid mass migration out of the bankrupt east. Yet unification so accelerated the east's bankruptcy and unemployment as to promote even more westward migration.

Ironically, one of the short term victims of this political economic process are the very civil society social movements, which brought on the transformation of eastern Europe in the first place [Frank 1990]. Progressive social movements and their organisations with 'forum' names in several countries have everywhere been bypassed in the rush to organise new political parties through which to reorganise the state. Sym-

bolically, in Czechoslovakia two of the leaders of Civic Forum in civil society, Vaclav Havel and Jiri Dienstbier, became president and foreign minister instead. The new leader of the now split Civic Forum is the economics minister Vaclav Klaus, who pushes ultra right wing free marketeer Thatcherist views and policies. No doubt, this ideological reliance on the 'free' market will fail to address the real problems in the economy and will sharpen economic, social, and political polarisation. That, in turn, will again generate new social movements. However, then they will threaten to become fascistoid populist ones instead.

In the meantime, the plans for 1992 and now the new recession have made the west preoccupied with its own economic problems. Now the Gulf War has aggravated these Western markets, capital, and attention are constrained by problems at home and in the Gulf, and they offer little more than moral support to the ex-east. Therefore, western Europe is doing precious little to forestall these dangerous political developments in the east through economic aid. The new European Development Bank is itself underfunded and only makes loans at commercial rates. At the moment, the prospects for a 'European Marshall Plan' are dim indeed. The west has not even offered to write off or significantly reduce the enormous external debt payments with which several countries in eastern Europe are burdened. (However the West German state *de facto* assumed the US 20 billion dollar of GDR foreign debt and much internal and enterprise debt at the time of currency reform before unification.) Except for the ex-GDR, the economies of eastern Europe and the Soviet Union are receiving scarce support or even attention from the west. At the same time, the previous east European and Soviet regional economic arrangements are breaking down.

THE MEDIUM TERM

Therefore, the medium term economic irony is that domestic economic and political liberalisation and the breakdown or abolition of COMECON are breaking up the only still available international economic foundation of east-east trade. Eastern and central Europe are dependent in various ways on fuel and other raw materials from the Soviet Union. This dependence is physically based on the already installed network of oil and gas pipelines and railways. (A further bitter irony is that Iraq had agreed to pay off its own large debts to several east European countries by supplying them with oil - until the UN embargo and then the Gulf War left eastern Europe high and dry and with tripled import prices for oil to boot.) The dependence on the Soviet Union is also economic, since these countries cannot import and pay for fuel from elsewhere. They cannot do so as long as they are in turn dependent on manufacturing exports to the Soviet Union and to each other, which they cannot sell in

the west because they are not competitive there. The east also has difficulty selling them in the south, because the west and east Asia increasingly outcompete it there and must take away some of its market share to compensate for domestic and export markets lost to the new recession.

Therefore, conversion of east European and Soviet trade from transferable accounting roubles to hard cash dollars can only exacerbate the problem of their mutual economic dependence. The medium-term economic result can only be that the short-term domestic economic depression and unemployment in each country is exacerbated by the international decline of its export markets elsewhere in the region and the impossibility of replacing them by export markets in the west and south. Dollarisation and regionalisation among republics within the Soviet Union and Yugoslavia and elsewhere extends the same problem inside these 'countries'. Again, the new ideology and politics is also replacing the old international economic organisation before it can be replaced by another new one. Therefore, another economic irony is that, after the cancellation of its foreign debt, the next best thing eastern Europe could get from the west would be a fund of convertible currencies to maintain its existing international trade network among each other and with the Soviet Union until it can be replaced by more multilateral east-west trade in the long run. However, the long run also poses further economic limitations and ironies.

THE LONG TERM

The long term economic irony is that many of the 'second world' east Europeans who sought to join the 'first world' west will find themselves in the 'third world' south instead. This irony is long term in three respects. The first one is not really so ironical except in reference to present ideals: it is that historically eastern Europe, albeit culturally European, was never economically developed like western Europe in the first place. Therefore, their people have little historical claim to become west European now. Only part of the eastern part of Germany, the Bohemian part of Czechoslovakia, and in some sense part of Hungary, Slovenia and maybe part of Croatia in Yugoslavia in central Europe plus perhaps the Soviet Baltic republics were historically similar to western Europe.

The second long term economic irony is that 40 years of the politics and ideology of 'socialist development', literally not to mention the 'development of socialism', seems not to have changed the economic positions of these regions, neither relative to each other, nor relative to western Europe. (Indeed there is some question of whether these 40 years even changed their internal class structure much.) If there was any change of position (or of class structure) it was mostly the decline of Bohemia, Hungary, Slovenia and perhaps the Baltics

EVERYTHING YOU EXPECT FROM THE FIRST EVER ISSUE BY A **BUSH** COMPANY*. INCLUDING A PREMIUM!

Public Issue of 19,20,000 Equity Shares of Rs.10 each at a premium of Rs.5 per share aggregating to Rs.288 lakhs.

FACTS ABOUT 'BUSH'

- A well known brand in Monochrome and Colour Televisions, VCR, VCP, Radio, Stereo Cassette Recorder, Hi-Fi System, Compact Disc System, In-Car entertainment products and Computer Monitors
- Products manufactured in technical assistance with NEC and AKAI of Japan
- Products renowned for their high quality and reliability
- Extensive marketing network of over 3500 dealers Sales and Service offices covering every Indian State
- R & D facilities approved by the Department of Science and Technology, Government of India
- Bush Colour Televisions have been awarded the British standard approval for safety (BS 415 1990)
- Group Turnover for the year ended 31/3/91 exceeds Rs 170 crores

**ISSUE OPENS ON
12TH AUGUST, 1991**

If the Company does not receive minimum subscription of 90% of the issued amount the entire subscription will be refunded to the applicants within 90 days from the closure of this issue. If there is a delay in refund of such amount by more than 10 days the Company will pay interest at the rate of 15% per annum for the delayed period.

CAUVERY ELECTRONICS LTD.

*A member of the BUSH Group

Registered Office: Zenith Building, Race Course Road
Mahalakshmi, Bombay 400 034

Lead Managers to the issue: PNB Capital Services Ltd. Bombay • State Bank of Hyderabad, Bombay

Co-Managers to the issue: ANZ Grindlays Bank, Bombay • The Hongkong & Shanghai Banking Corporation Ltd. Bombay • Indbank Merchant Banking Services Ltd. Bombay • Oman International Bank S.A.O.G. Bombay

ISSUE HIGHLIGHTS

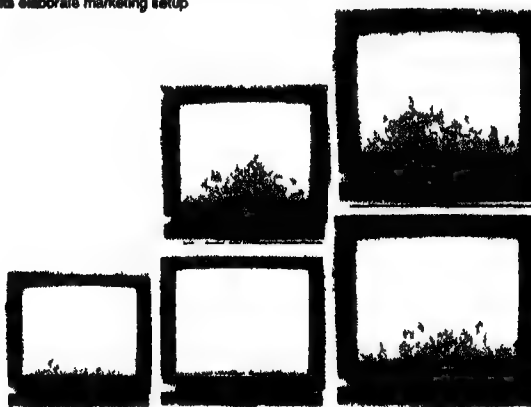

- A well established, profit making, dividend paying Company from the BUSH GROUP
- Reputed manufacturer of a range of Monochrome and Colour Television sets — all sold under the 'BUSH' brand
- State-of-the-art manufacturing facility at Gandhinagar in Gujarat
- Operates a sophisticated STUDIO-BUSH FX at Bombay. Equipped with the most advanced Betacam editing facilities and computerised animation system. Also incorporates Video to Film conversion equipment.
- Substantial export contracts in hand to hard currency areas
- Equity shares being issued at a premium of Rs 5 per share against a Book Value of Rs 28/ (Ex 1:1 bonus issue on 23rd April 1991)
- Listing at Bombay and Ahmedabad Stock Exchanges

RISKS AS PERCEIVED BY THE MANAGEMENT The Company foresees the competition in the domestic market in the Electronic Industry as is normal and prevalent in any industry. However, it expects a bright future for exports as indicated by favourable government policies.

Some critical components required by the Company are imported. The Government's Import Policy will thus have a direct bearing on the working of the Company. However, the Company has steadily reduced its dependence on imported components over a period of time.

In view of the sizeable export orders on hand, the Company does not envisage any difficulty in procuring critical imported components.

The Company does not also anticipate any problem in marketing its products in view of its elaborate marketing setup.

BUSH

in central and 'socialist' Europe relative to the rise of parts of Spain, Italy, and Greece in 'capitalist' southern Europe. Industrialisation, of course, modified the class structure everywhere in Europe, but apparently not more and perhaps less in the east than in the west and south. Therefore, only the above mentioned regions in central Europe now have a fighting chance to recuperate their historical positions in Europe, and that in competition with southern Europe. Public opinion in southern Europe already shows itself very aware of this threat, while in central and eastern Europe it still appears even unaware of the problem.

The third long-term economic irony, therefore, is that the same present day political and ideological changes in eastern Europe through which its people aspire to join the first world in western Europe now threaten instead to place eastern Europe economically in the third world—again, for that is where it was before. Poland has already been Latin Americanised. The earlier dependent agricultural (and only temporarily, oil) export economy par excellence of Romania will be lucky and thankful if it can even recuperate that position, now in competition with Bulgaria, which developed agribusiness for export during the 'socialist' regime.

The same problem obtains *a fortiori* in the Soviet Union. A few parts of Russia and the Ukraine were westernised by Peter the Great and industrialised by him, Witte, and Stalin. But most of the Soviet Union at best still is a third world economy, like Brazil, India and China, which also have industrial capacities especially in military hardware. The Transcaucasian and central Asian regions, whether they remain in the Soviet Union or not, are not even likely to be Latin Americanised, but rather economically more Africanised or, god forbid, politically Lebanonised. The same sad fate may befall much of southern Yugoslavia, whether it remain one or, more likely, become several.

Many of these regions now face the serious prospect, like Africa, of being marginalised out of the (admittedly exploitative) international division of labour. Their natural resources have been squeezed dry like a lemon for the benefit of industrial development farther north, and now the regions and their peoples can be discarded. That is the political position, for instance, represented by the Russian president Boris Yeltsin. The southern inhabitants' wrath at having so long been exploited in the past and demanding its cessation for the future is understandable. So is the appeal to (or discovery of) 'traditional' ethnic and national identity and inter ethnic strife in response to aggravated economic deprivation, such as 30 per cent unemployment in parts of Soviet central Asia. However, political 'independence' and inter ethnic strife in central Asia or central Africa now can afford them little economic benefit in the future. On the contrary, the erection of politically motivated ethnic and other bar-

riers to economic interchange, and even exploitation, threatens to convert them separately and altogether (back) into backwaters of history. (However, the 'centrality of central Asia' was a fact of history for millennia before the world's present north-south arrangement took shape in the 16th century [Frank 1991c].)

Bitter experience has shown that second world 'socialist' 'national development' in China, the Soviet Union and eastern Europe was unable to break out from or overcome the constraints of competition in the world economy. The events of 1989 and 1990 eliminated all their remaining ideological legitimacy and credibility. However, while many observers limit their attention to the bankruptcy of the 'socialist' component of this ideology in Europe and Asia or Africa, reality has undercut its 'nationalist' component equally or even more so. For, other national development strategies in Africa, Latin America, and Asia were essentially similar and often failed equally or even more so. So we observed in our comparative review above of economic policy by communist parties, military dictatorships, and their successor democratic governments. Thus, the long term economic irony is that the prospects for 'another national development' by any other political means, whether separately or together, are not good. On the contrary, these prospects are now quite bad for the underdeveloping third world regions of eastern Europe and the Soviet Union. However independently of their national ideology or state policy, they are equally bad and in some cases even worse for most still underdeveloping third world regions elsewhere.

PERSISTENT ECONOMIC IRONIES IN THIRD WORLD

Ironically, economic underdevelopment persists in most of the third world south in the face of almost all manner of ideological solutions and political efforts to overcome it. This story is not new and requires little elaboration here. However, there are some new ironic twists of fate, which merit note in the present context. In this regard, I may be permitted to repeat my reflections in my recent and partly autobiographical and auto critical essay 'The Underdevelopment of Development' [Frank 1991b].

Real world system development has never been guided by or responsive to any global and also not to much local 'development' thinking or policy. In this world economy, sectors, regions and peoples temporarily and cyclically assume leading and hegemonic central (core) positions of social and technological 'development'. They then have to cede their pride of place to new ones who replace them. Usually this happens after a long interregnum of crisis in the system. During this time of crisis, there is intense competition for leadership and hegemony. The central core has moved around the globe in a predominantly westerly direction. At the

sub-system levels of countries, regions or sectors, all 'development' has occurred through and thanks to their (temporarily) more privileged position in the international division of labour and power. The recently prevalent notions of 'national development' are the result of a myopic optical illusion. These notions and the illusion are derived from a self-interested selective tunnel vision perception. It lacks an objective global assessment of real world development. This development ideology was based on and is now doomed by this self-illusory perception. It is less and less sustainable in the face of hard reality. Instead as suggested above, we now need to replace this development theory, as well as micro-supply and macro-demand side economic theories, by another one. We need a more rounded, dynamic and all-encompassing supply and demand side economics to analyse, if not to guide, world economic and technological development.

The most widespread political ideology and 'development theory' for the last decade or two has been that 'national development' is best pursued through the 'magic of the market' by letting 'free enterprise' promote 'export led growth'. The stellar models are South Korea and Taiwan. These two have indeed done well in the world market recently. Unfortunately for the ideological model however, their success was not the result so much of free enterprise as of state intervention. Moreover, their state's ability to do so was in turn based on three earlier political factors: pre-war Japanese colonialism, post-war American imposed land reform, and massive cold war subsidies.

Unfortunately for the ideological peddlers of this political model and for the many countries of Latin America, Africa, and south east Asia who pursued essentially the same export-led growth strategy, outside the city states Hong Kong and Singapore, it failed miserably elsewhere. Moreover, the possibilities of continued success by Korea and Taiwan are now increasingly questioned, not to mention the political and social costs of these dictatorships while they lasted. The reasons of course are the exigencies of competition in the changing world market, particularly during the new world economic recession since 1990.

In this increasingly technological competition in and for the world market it is not yet clear who has made the grade to survive. To put it differently, in this world economic game of musical chairs it is not yet clear who will still have a seat when the music stops the next time, as it well may in this new recession. Perhaps Korea and Taiwan have, but more than likely they have not, and their success in carving out a world market share will be temporary at best.

However, it is clear that outside Japan much of the remainder of Asia, Africa and Latin America, as well as most of eastern Europe and the Soviet Union have not made the grade. Resource saving industrial development and the development of a ser-

vice/information society deprives them of their 'traditional' world markets for raw materials and reduces their comparative advantage as low labour cost producer exporters. At the same time, technological upgrading to remain competitive in the world market has failed in most of this third and 'second' world, but of course also in many sectors and populations in the industrially developed 'first' world and particularly in the United States.

Returning to my autocritical essay on development again

—What is a realistic prospect, therefore, is the growing threat to countries, regions and peoples to be marginalised. That is, they may be involuntarily de-linked from the world process of evolution or development. However, they are then de-linked on terms, which are not of their own choosing. The most obvious case in point is much of sub-Saharan Africa. There is a decreasing world market in the international division of labour for Africa's natural and human resources. Having been squeezed dry like a lemon in the course of world capitalist 'development', much of Africa may now be abandoned to its fate. However, the same fate increasingly also threatens other regions and peoples elsewhere. Moreover, they may be found everywhere. In the south (e.g., Bangladesh, the Brazilian north east, central America, etc.), in the ex-industrial rustbelt, the south Bronx, and other regions and peoples in the west, and in whole interior regions and peoples in the 'socialist' east, e.g., on both sides of the Sino-Soviet border. Events in 1989-90 must accelerate and aggravate the marginalisation of millions of people in eastern Europe and the Soviet Union. As noted above, many regions there are more likely to be Latin Americanised, and some even Africanised and Lebanonised, instead of achieving the west Europeanisation to which they aspire. —People in all these and other places may now be sacrificed on the altar of growth pole 'development' policy. They fall victim to inefficient competitive participation in the international division of labour in the world capitalist market and to contemporary social evolution. However, the west may well receive much more migration by the few who can, among the many who wish, to escape this marginal existence in central America and Africa. North America and western, but soon maybe also eastern, Europe and Japan will be the magnets. Many people prefer to survive exploited by the division of labour in the north than to suffer death by war and starvation or marginalised life without hope in the south.

—In other words another economic irony is that a dual economy and society may now indeed be in the process of formation at this stage of social evolution in the world system. However, this new dualism is different from the old dualism I rejected in my earlier writings [Frank 1967 and others]. The similarity between the two 'dualisms' is only apparent. According to the old dualism, sec-

tors or regions were supposedly separate. That is, they supposedly existed without past or present exploitation between them before 'modernisation' would join them happily ever after. Moreover, this separate dual existence was seen within countries. I correctly denied all these propositions. In the new dualism, the separation comes after the contact and often after exploitation. The lemon is discarded after squeezing it dry. Thus, this new dualism is the result of the process of social and technological evolution, which others call 'development'. Moreover, this new dualism is between those who do and those who cannot participate in a worldwide division of labour. To some extent, the ins and outs of this world division of labour are in part technologically determined. Thus, this new dualism may partake of the old technological dualism.

ECONOMIC IRONIES IN THE 'WEST'

In the 1984 forerunner to the present article on ironies, I wrote about the 'Debt Bomb'

The danger of another crash in our world financial house of cards is a domino like chain reaction spreading through the world banking system into the world economic system. [It] would feed economic and political nationalism and encourage the resurgence of economic blocks such as we had during the 1930s. A dollar zone, a mark zone, a yen zone. [Frank 1984: 1987]

I had already mentioned the possibility of such regionalisation or bloc formation in the world economy in 1972 [reprinted in Frank 1981, Chapter 1], and I returned to this theme in greater detail [Frank 1986 and 1988]. Then, however, I saw this regionalisation already occurring in the real economy, and I returned to the debt bomb and the possibility of a crash as an aggravating factor. In particular, I analysed what *Business Week* had already termed the 'debt economy' in the United States. I emphasised the basic problem of the non-competitiveness of the American economy and therefore the decline of the dollar, the derivative twin budget and trade deficits, the crisis in the oil, real estate, and farm sectors, the resulting emerging crisis in the Savings and Loan (S and L) 'thrifits' or mortgage banks, and also the weakness of the commercial banks and the annually increasing number of failures among them, the shift from equity to debt and junk bond finance and swollen interest obligations of industrial and other corporations, which they would be unable to meet when their earnings and cash flow next decline and the dangerous exposure of all of these to the shock of the next recession. It would be the fifth and possibly the most severe in this world economic crisis, which started in 1967. Moreover, I argued that in this recession the traditional anti-cyclical monetary and fiscal instruments would already have been exhausted. This is because they had already been misused just to maintain the preceding cyclical recovery,

which itself had already exacerbated economic conflicts of interest between the United States, Europe, and Japan. Since then, all of these observations have become common place.

The next recession is here! The rate of profits declined again in 1989, continued to decline in 1990, and the recession became evident in 1990—some time *before* the Gulf crisis and war. A very small sampling of recent newspaper headlines (and text) sets the tone: 'US Profits Sign of a Slump (for second year in a row)', '13 Per Cent Fall Forecast for US (3.4 per cent annual rate in the last quarter of 1990)', 'Amid Signs of a US Recession, Bankruptcies Hit a Record', 'US Firms' Debt Service Burden Grows', 'US (corporate and municipal) Debt Downgrades Hit a Record in 1990', 'Portfolios of US Banks Are Shakiest in 15 Years', '20 Big Banks Head for Failure: US Agency Says Many Will Need Bailouts', 'US Deposit Insurance (of bank accounts) is 'At a Low'', '1991 Bank Failures Threaten US Fund', 'Most Large Institutions are on Verge of Insolvency, Congress Study Says', 'This Is a Rescue? The S and L Bailout Is Faltering And the Metc Keeps Running', 'No End in Sight: Politicians Hurl Blame as the US Savings and Loan Crisis Races out of Control' but not only at the S and L's, and not only in the USA.

The recession is already worldwide. Canada and Australia are in severe recession. 'UK Slump Worse Than Expected', France, Spain, Italy, the Netherlands, Sweden even Switzerland ('bank profits down') have reduced or negative growth rates. Africa is in depression. In Latin America, GNP declined 0.5 per cent and per capita 2.4 per cent in 1990, on top of a 10 per cent decline in the 1980s. As observed above, now it is the turn of eastern Europe with an overall 20 per cent decline in 1990, and of the Soviet Union. Now growth rates are down and debt up also in China and in India, which the crisis largely bypassed in the 1980s.

Are Japan and Germany exceptions? Can and will they be the replacement locomotives for the world economy during the early 1990s? Growth rates have declined already in Japan, as well as in Korea and Taiwan. The Japanese speculative bubble has burst as well. The stock market declined 40 per cent in 1990, real estate prices plummeted, and Japanese investors and speculators transferred funds inward from abroad to help them cover their losses at home. That is also why for the first time since 1986 and now that the United States needs it most, in 1990 the net flow of Japanese capital was *out* from the United States to Japan. The prospects for a severe recession in Japan and the East Asian NICs are quite real. Either way, the prospects for economic co-operation instead of competition by Japan in the world economy are quite dim. 'G-7 Aides Disagree on Policy', 'G-7, by Default, Gives Japan Go-Ahead on Loans to China'. If Japan primes the pump or steams up its locomotive at all, it is likely to do so in its

own region in Asia—and Germany in Europe.

The July 1990 Houston Summit of the G-7 industrial countries confirmed the live-and-let-live 'Sinatra doctrine': each one does it 'my way', and the others nod approval, as long as they have no other choice. At that summit, prime minister Kaifu of Japan announced a large scale programme of loans to China, and chancellor Kohl of Germany, a similar state, guaranteed loan of 5 billion DM to the Soviet Union. President Bush reiterated his 'initiative for the Americas' for a free trade zone from Alaska to Patagonia (and \$ 7 billion remission of debts out of the over \$ 250 billion!), which he had already hurried to announce a week earlier. In each case, the other two listened, acknowledged, and did nothing either to participate or to stop it. Thus, they consecrated what the Soviet spokesman Gennadi Gerasimov had in another context baptised as 'the Sinatra doctrine'.

Germany's first priority was and is reunification. The economic and social costs are enormous, and they are borne mostly by the people and their government(s). So far private industry in the west of Germany has been very slow to invest in the east of Germany—and much less even in the east of Europe. How long it will take Germany to get up the steam to put its locomotive in motion remains to be seen—in central and eastern Europe. Little of this locomotive power is likely to be visible in the world economy elsewhere. On the contrary, as an economy that has been very dependent on exports to the world market, Germany itself has already suffered from declining export markets due to the recession elsewhere in the world economy.

Thus, the threat that world recession in the early 1990s will be even more severe than in the early 1980s is quite real. As I wrote in 1989 about 'Blocking the Black Debt Hole in the 1990s'.

The question is less one of a soft or hard landing than whether the world economy has already bottomed out, or whether the next recession will be still deeper once again. This is a serious danger, because the next recession threatens to exacerbate all these imbalances and to accelerate their resolution by sucking the world economy into the black hole of debt (to use the expression of MIT economist Lester Thurow). The accumulation of domestic and foreign debt in many parts of the world is likely to inhibit further domestic reflationary finance (call it Gramm-Rudman in the United States) to combat recession just when it is most needed in the next recession. That would be among other things to forestall the bankruptcies of junk bond financed corporations and banks dependent on interbank loans. Both US and Japanese monetary policies would be damned if they do and damned if they do not...

The continuing world economic crisis is exacerbating the accumulated regional and sectoral imbalances especially among the

world's major trading regions of America, Europe, Japan, and their third world and socialist trading partners. They will find it ever more difficult to manage the growing conflicts between financial debt speculation and real economic productive investment, through the already conflicting monetary, fiscal, exchange rate, trade, security and other policies. Therefore, another (again more severe?) recession threatens also to spark another (also more acute?) crisis within the crisis. More of the same muddling through is likely to become impossible. Any possibility of reimposition of the old American dominance (or an alternative Japanese new dominance) in a multilateral world economic and financial system or its co-ordinated management by the G-7, G-5 or G-3 is improbable in such a recession (a US bomb and Japanese yen based Pacific basin political economic consortium is possible but rather unlikely, and one including Europe even less likely.) The most likely possible alternative resolution will therefore be increasingly neo-mercantilist regionalisation of the world economy into American dollar, Japanese yen and German led European ECU/D mark zones and/or trading (and political?) blocs [Frank 1990c].

ECONOMIC IRONIES IN THE GULF WAR

That was still the situation on August 2, 1990 when Iraq invaded Kuwait and all the more so on January 17, 1991, when the United States with 23 other countries in tow started bombarding Iraq. Tons of ink have already been used to analyse and/or propagandise this war and its buildup, and I have myself added my two cents' worth [Frank 1990d and 1991a]. Here, we may confine our observations to the [ironical?] probable economic background and possible economic consequences of this world geopolitical drama and human tragedy.

Both invasions had economic backgrounds if not motives. Iraq's were its huge debt and reconstruction needs after its war with Iran; Kuwait's drain of their common oil field and other long standing disputes; the decline in oil prices due to the recession and increased production by Kuwait and Saudi Arabia, which were perhaps deliberately decided to weaken Iraq. President Hussein pleaded Iraq's oil interests to the Arab Summit in Baghdad in May 1990 and again to the American ambassador in Baghdad in late July. To no avail, and he invaded Kuwait in August—after the American ambassador indicated that the United States had no interest to intervene.

In the wake of an oncoming recession and cuts to the Pentagon budget, president Bush already invaded Panama eight months earlier. Now he deliberately escalated the crisis sparked by president Hussein's invasion into a full scale war. That was not unusual and should not have been surprising. In the face of every recession since the second world war, every American president before him also had recourse to a military

response and/or escalation [Frank 1990 and 1991a]. Former president Nixon summarised in the *International Herald Tribune* on January 7, 1991: "When Senator Bob Dole said we were in the Gulf for oil as secretary of state James Baker said we were there for jobs, they were criticised for justifying our actions on purely selfish grounds. We should not apologise for defending our vital economic interests."

However, American economic interests and their defence extend far beyond oil the Gulf and jobs at home. These interests are worldwide, and the primary threats to them are competition from Japan or Germany, or from a Japanese led Asia or a German led Europe—all the more so now that the Soviet 'threat' is virtually eliminated. As we observed, the cold war over—and Japan and Germany have won! The Reaganomics of the 1980s helped eliminate the Soviet Union from the running but at the cost of mortgaging the American economy and even its government's budget to the Japanese and the Europeans. The United States is now economically dependent on continued capital inflows from its principal economic rivals, and the Japanese already began to withdraw capital from the United States in 1990 instead. In response to even deeper recession and/or great deliberation, they now threaten to pull their financial rug out from under the United States and its dollar altogether. At the same time, trade and other economic disputes grew ever deeper at various points including the GATT Uruguay rounds. Japan was distinctly un-cooperative, and Europe refused to budge more than a few per cent on the issue of agricultural subsidies. At the same time, the road to 'Europe 1992' was made more difficult by the 1989-90 events in eastern Europe and by Britain's intransigent looting dragging.

Comes August 2, 1990. President Bush and his secretary of state Baker go on a spectacularly successful diplomatic campaign: line up their recalcitrant allies and even the erstwhile enemies, like the Soviet Union or Syria, behind American policy in the Gulf—and by extension elsewhere. The most enthusiastic support for president Bush came from the British prime minister Thatcher. She was in Washington in early August. There in addition to sharing her ideology with president Bush as she had with his predecessor Reagan, she now took advantage of an opportunity to support him—or even to egg him on?—to throw another monkey wrench into the process of European unification.

However, president Bush required little encouragement to proceed, despite—and perhaps rather because of—those with the least enthusiasm: Japan and Germany. They are the rival economic powerhouses that hold the economic keys to American economic survival during this new recession. However, they have no seats or voice, let alone a veto, in the Security Council! At that is where the first battle of the Gulf War

was to be fought—to align friend and foe behind American military might, which is the only one it still has left to support its geopolitical power

This is where mutually supportive further ironies come in. Since the second world war, the United States has not been able to use its military might against Japan and Germany, and it can no longer do much for them either, now that the Soviet military threat is waning. However, the United States still can—indeed without Soviet encouragement now all the more so—use its military might in and against countries in the third world. The other economic irony was spelled out by the American *National Interest*: 'The fact [is] that the military power of the United States was the only thing capable of mounting an effective riposte—when the economic power of a Japan or a Germany was virtually irrelevant. The London *Sunday Telegraph* (January 20 1991) comments editorially: 'This is not going to be a multipolar world. If there is to be a new world order, it will be based on US military power with Britain playing a key role. Saddam's scalp will be its first trophy.'

In other words the crucial irony is that president Bush has taken good advantage of a black golden opportunity to try to redress declining American hegemony against its principal economic rivals in Japan and Germany by playing the only—that is military—ace he still has up his sleeve. Of course, at the cost of Iraq and the third world, where this war is being 'played out'. Without exception all east-west wars since 1945 were fought on third world soil. Now the west-west competition is to be fought out in the south as well.

In June 1990, the former editor of the American foreign policy establishment's *Foreign Affairs*, James Chace, could still write in *International Management*, Europe's business magazine:

AUF WIEDERSEHEN USA There will be a European challenge. Europe has turned Servan Schreiber's thesis on its head. Today it is the United States that is fearful of Europe's economic strength and worried about its own relative economic decline. Approaching 1992—if there are severe economic dislocations or, let us not forget, a global recession—there is no telling how the new Europe will react. From this prospect arises the even more frightening spectre, to Americans at least, of a Fortress Europe dominated by great industrial groups that could freeze all competitors out of its market. If this should happen, the risks to the United States would be huge. The likelihood that the Europeans will eventually form a pan-European security system of their own will further reduce US power and influence. Washington is almost desperately eager to remain in Europe. 'The United States should remain a European power in the broadest sense, politically, militarily and economically,' said US president Bush in a speech last month.

Two months later, Saddam Hussein offered president Bush an opportunity to

meet the European challenge. President Bush successfully bluffed or finessed all of the Europeans, albeit less so the Japanese, to line up behind him—and to fall out among each other. Thatcher lost the battle and her job, but so far she has won her war both in Iraq and in Europe! The war is exacerbating the political and economic conflicts of policy within Europe, on which she made her stand against a more united western Europe.

With her help, the United States also has already achieved at least two major political coups in Europe beyond getting its support for the war itself. One is to scuttle even the pretence at a more independent European policy towards the west Asia and in favour of a more reasonable settlement of the Palestine-Israeli issue. Israel's all-purpose minister Isaac Rabin, recently declared that Israel has no use for Europe or the United Nations. For the time being, the American-Israeli line is unchallenged, except by the for now weakened Arabs themselves.

The other coup is the transformation and diversion of NATO. Far from constructing a stronger post-cold-war European pillar in NATO, let alone an alternative European security system, the Europeans have now acceded to an already earlier American pressure, which they previously resisted. To turn the NATO thrust south-eastward to intervene in west Asia in particular, and in north-south conflicts in general. American troops, bases, material, and logistics, but also those of several European countries' NATO contingents have been diverted from the defence of western Europe against the Soviet Union to the attack against Iraq in west Asia! They even took their Central European Air 1 and Battle plans with them to Arabian desert. Moreover, the Europeans are paying not only their own but also many of the American costs of this diversion. Europeans are even paying for the fuel that American B-52 bombers use when they take off from and are refuelled by bases in Europe. The use of Turkish bases to bomb Iraq also serves to engage NATO and through it the reluctant Germans, in this American-led north-south war.

The Europeans are not only supporting president Bush's war politically, militarily and financially, now even with modest contributions from Germany. Beyond that, a week before this writing it was announced that the Europeans have finally also caved in on the issue of agricultural price supports, their biggest protectionist measure, which had scuttled the last meeting of GATT. Symbolically its last deadline for reconsideration was the same January 15, 1991 set by the United Nations for Iraq to get out of Kuwait—and for the United States to go to war!

The decisions and *fait accompli* to go to war were made at the highest national and international levels. These governmental leaders not only failed to consult their populations and voters. President Bush deliberately avoided putting the issue to

Congress until long after the Congressional elections and his subsequent doubling of American Gulf troops in November 1990. In so doing, these government leaders ironically also pulled the rug out from under the social movements in civil society both in the United States and western Europe, after these movements had already been bypassed in eastern Europe. The mobilisation of civil society around a myriad of local, national and international issues of gender relations, environmental issues, and ironically since the shooting started the peace movement received a brutal blow. Even the director of that old cold-war think tank, the International Institute for Strategic Studies, observed in the *International Herald Tribune* (February 11, 1991) 'the current collapse of pacifist movements in western countries, not the least Germany, is one of the notable features of the war'.

The media confronted people in Europe with a choice between the Iraqi Saddam Hussein and the American George Bush. With that choice, the man in the street and in front of his TV set chose the white American. More women, fortunately or wisely, refused that false choice and opted for peace instead. Nonetheless, European civil society rapidly became shot through with rabid racism and chauvinism directed against any and all Arabs and Turks—in total disregard of the fact that many governments of Arabian countries and Turkey (which also has its eye on some Iraqi petroleum-producing territory) are loyal and active members of the allied coalition of the Americans and Europeans. Thereby these west Europeans may also be demonstrating a preference for replacing cheap non-European labour from the south by the newly available source of European cheap labour from the east. Certainly, the people in Europe, and of course in the United States as well, demonstrate that they are not entirely duped by the myths their leaders and media propagate about any supposed 'principles' in this war. Instead, these people in the north demonstrate through their own belligerent action against coloured immigrants or workers from the south on the streets at home that they feel and understand the war in the Gulf is between *their* north and the south. At the same time, the people in the south feel and understand the same thing. That is why all around the equator not only Arabs and not only Muslims, but all kinds of other people in Asia, Africa, and Latin America demonstrate against the United States, which is making war against the third world, and in support of Saddam Hussein who, however cynically, has been cast in the role of defender of the south.

The perhaps also ironic question remains whether in the long run this north-south war in the Gulf will recoup American hegemony or destroy it. President Bush is well aware of this major question. He devoted much of his January 1991 state of the union message to the Gulf War and gave his answer directly to this question and perhaps indirectly to

why we went to war against Iraq in the first place: America's responsibility to 'defend freedom' is greater than ever and therein its golden age lies not behind, but before it. President Bush may not be deliberately bluffing when he says so, but does he have the political economic cards in his hand to make his prediction come true? Or may the ultimate economic irony be that this gamble at prolonging the American century through yet another war will cost the United States so much as to become its last Indian summer swan song?

Only time will tell. In the meantime, we may rephrase this question in more concrete military, political, and economic terms. President Bush received military intelligence from his military advisors and political allies, like president Mubarak of Egypt, who said, that an air war of two days and at most two weeks would destroy enough Iraqi military capacities to render a ground offensive uncostly or even unnecessary. A ground offensive, if any, would only begin after most or at least half of the Iraqi military capacity had been destroyed from the air. After three weeks of the by far most massive bombardment in history, the allies had to admit that they eliminated at best 20 per cent of Iraqi military capacities, and very few in or near Kuwait.

The original deployment of American and other troops and equipment was 'to defend Saudi Arabia' from possible, albeit never threatened, attack by Iraq. However, there was at least one other reason for the choice of Saudi Arabia as the site for the massive buildup. During more than a decade after the debacle with Iran, the United States had built up Saudi Arabia as its client regional military power in west Asia next to Israel. The United States sold Saudi Arabia tens of billions of dollars of arms (in support of its own industry and balance of payments) and built up a whole network of naval and air bases, which Saudi Arabia pledged to make available to the United States for use in case of an emergency in the region. Saddam Hussein's invasion of Kuwait provided that emergency. Then the United States shipped nearly half a million troops and their supporting naval and air forces to Saudi Arabia, which is the only place that has the necessary ground facilities ready to receive them!

Even so, the allies had over five months time to put their offensive capacities in place there. Therefore, the deputy commander of the US military transportation command observes that "we ought to keep in perspective that we have had the luxury of time—161 days to land all that stuff without anybody firing a shot." Moreover, "47 per cent of it came from foreign ships, which might not be available in the next emergency." These facts, argues the *Washington Post*, "make Operation Desert Storm an inadequate test of the US military's usefulness in forging what president Bush called 'a new world order', according to military analysts" [*International Herald Tribune*, February 11, 1991]. We need note only in passing how

these analysts and publicists take it for granted that 'the new world order' is to be 'forged' by US military intervention in one 'emergency' after another. But at what political and economic cost, and can the United States afford them?

The political motive for getting the war over quickly was the fear that the allies' coalition could not hold up under the political strain of a long war and mounting casualties. Allied casualties appear to have been maintained relatively light in the air war. However that did not test Iraqi army in a ground war, in which it has much greater advantages. Moreover, the mounting civilian casualties in Iraq are turning more and more Arab public opinion against the war and the allies. There have been massive popular demonstrations from Morocco to Bangladesh against the governments which support the war. Thus the political cost of the war is mounting also. The same Israeli minister Rabin recommends that after the war the oil countries contribute their oil riches especially to Egypt and Syria "to stabilise the moderate regimes in the international coalition so that they can maintain themselves in the face of the zero sympathy of their citizens" [interview in *El País*, February 10 1991].

Iraqi missile attacks against Israel have increased sympathy for Israel in the west and by not responding against Iraq (although yes against Lebanon!) Israel has not yet brought other Arab governments to abandon the coalition. If Israel still intervenes, and God forbid uses its nuclear arsenal, the political as well as human cost will still be high. If it does not, Israel intends to charge a high political price for its war time 'restraint' in any post war west Asian political settlement. Either way therefore American protection of Israel and also its Muslim allies in the Gulf War will also come at a high political cost in the region and perhaps in Europe. Whatever political settlement may or may not be possible after the war, can the United States continue to bear this political, indeed also probably continued military (presence) and economic cost and price?

Is the weakened and now recession ridden American economy in a position to ride out the Gulf War successfully? The political costs beyond the direct costs of waging war in west Asia may also become an additional economic burden to the United States. The reasons are the need to pay subsidies to some poor allies, like Israel, Turkey and Egypt, to the last of whom \$ 7 billion of debts were already forgiven—and the threat of losing the *de facto* subsidies the United States has been receiving from the friendly rich governments of Saudi Arabia, Kuwait, and the Arab Emirates which have long since supported the American dollar, balance of payments and (military) economy. The first two alone have already made some \$ 25 billion of direct new 'contributions' to the United States only to pay for the 'new world order' mercenary services of its military

forces in this War in their Gulf. The Americans may be able to shame these governments in west Asia and others in the west to drop their contributions into the hat the United States passes around while the war lasts. But after that? What if the military and political consequences of the war destroy the riches and/or bring down these elitist governments in west Asia and replace them with more popular but less friendly ones? What if America's western allies again replace their wartime political competition by peaceful economic cooperation?

At home in the United States, the Gulf War is distracting attention from the deepening recession. That may be another one of its purposes, particularly in distracting public opinion from increasing bankruptcies and unemployment. However on the policy making level this diversion of needed attention from the recession may be a short sighted or even ostrich policy. It can become costly in the middle run, if it lets the recession get all the more so out of hand. More so because even without the distraction of the war, the US government and federal reserve have scarce anti cyclical economic policy instruments left to combat recession. Most measures to stem the recessionary tide at home like lowering the rate of interest as the Fed did in early 1991, only open the floodgates even more to a lower dollar and reduce or reverse the capital flows from abroad which the American economy also needs to remain afloat. The ongoing debates about how a shorter or longer war will affect domestic consumer confidence or spending and therefore the outlook for recession or recovery are largely beside the point. They are largely attempts to blame the recession on the war, while if there is any such causation, it is the other way around from the recession to the war. The main recessionary forces are both prior to and independent of the war and as observed above they may have given president Bush an additional impulse to go to war.

Probably more important than the confidence of consumers at home in the United States, is the confidence of international capital and of allied governments elsewhere in the west. The more important effects of the recession and war will play themselves out via the reactions of private capital and the decisions by governments and central banks in Europe and Japan. The German (central) Bundesbank and following it perforce the Dutch and some others, already followed the US interest rate decline by raising their own rates of interest to the dismay of the more recession ridden United States, Britain and France. The fixed exchange rates within the European Monetary System were brought under pressure, the dollar immediately plunged and capital was attracted to Germany. As usual the intervention of the central banks to shore up the dollar was to no avail. The Bundesbank president defended his decision by saying that he was contributing to 'stability' in fighting against

inflation in Germany, which is Europe's most important—but also still most healthy—economy. Let the devil take the hindmost!

How long will the Japanese and the Europeans, other than the British with their 'special relationship' but most depressed economy, continue to lend a helping hand of private and public funds to support the American war in the Gulf and the American economy at home? That is the question. For without foreign active political and material economic support, the United States no longer has the domestic economic base even to finance this war, let alone to build a new world order of its own design. Walter Russell Mead correctly observed in the *International Herald Tribune* [February 7, 1991]

At a time of diminishing national resources and power, the United States has not lowered its foreign policy horizons, it has universalised them. The mirage of universal alliance against instability, led but not paid for by America is potentially the most dangerous idea in US foreign policy in the last generation. It raises expectations that cannot be met. It tempts Americans to take on responsibilities beyond their resources. While they want the post Cold War order to evolve in (New World Order) ways that defend American primacy America's associates want it to diminish.

There is the rub! The Soviet Union never had the economic clout to support its claim to being a superpower. Now it is being downgraded into the position of an over armed third world/rate power. The United States was long obsessed with its political and ideological security in (successfully) defeating the Soviet Union in the cold war. In so doing, the United States neglected to maintain its real economic base in competition with its real competitors in Japan and Europe. So now the United States no longer has sufficient economic clout to be a super power either.

Yet with president Bush waving the American flag, the United States rushed in where angels fear to tread. It rushed into war in the Gulf in a probably vain attempt to shore up its declining power on the world stage one last time by the only means it has left and knows how to use—its military power. However, without an adequate economic base, military power is insufficient to keep a great superpower afloat. On the contrary, the foolish use of its military power may instead sink that power. It is not for nothing that Paul Kennedy became a best seller (apparently not in the Bush White House or the Pentagon) when he wrote that foolish military overextension beyond the economy's means to support it is the basis of *The Rise and Fall of the Great Powers*.

INDIAN INSTITUTE OF MANAGEMENT CALCUTTA NATIONAL CONFERENCE on ACCOUNTING AUDIT AND FINANCE—YEAR 2000

CALL FOR PAPERS / DELEGATES

The conference will attempt to capture views of academicians and practitioners on the following issues with a focus on 2000 A D

ACCOUNTING AND AUDIT

- MATERIALITY OF ACCOUNTING INFORMATION
- ACCOUNTING STANDARDS AND STAND OF AN ACCOUNTANT / AUDITOR
- EDP IN ACCOUNTING AND AUDIT

FINANCE

- DEVELOPMENT OF CAPITAL MARKET AND ROLE OF FINANCE MANAGER
- COMMERCIAL BANKING

Likely Date

January 4 & 5, 1992

Delegate Registration Fees

| | |
|-----------------|----------|
| Residential | Rs 800/- |
| Non-residential | Rs 500/- |

Submission of papers: Two copies of papers should be sent to any of the following Conference Directors latest by 15th November 1991

Conference Directors

Prof. Hrishikes Bhattacharya

Prof. M. P. Vithal

Prof. Mousumi Ghosh

Address for Communication

Latin America: Poverty of Democracy and Democracy of Poverty

James Petras
Morris Morley

The divergent outcomes resulting from the crises in eastern Europe and Latin America are not the result of the demise of economic systems or the superiority of one system over the other but have more to do with the willingness and capacity of the US to reshuffle political regimes while retaining strategic ties to the underlying authoritarian states and economic elite structures. At the same time Latin America's coercive structures have also exhibited a capacity to hold on to power during periods of transition thus guaranteeing the continuity of the social system against democratic social movements and mass popular upheavals.

OVER the past decade, liberal capitalist experiments have plunged Latin America into its deepest crisis this century—and one that shows no signs abating. Deregulated economies (free markets, 'open door' investment policies, privatisation) have been synonymous with unprecedented social polarisation, downward mobility and plummeting living standards for millions of people, the spectacular growth of non-wage/salaried ('casual') labour (over 80 per cent of the region's workforce), and multi-billion dollar fortunes by 'insiders' working the international financial trade circuits and with access to the public treasury. The 1980s also witnessed massive pillage at the level of the economy (by foreign and local investors and bankers) and the state (by elected politicians and non-elected officials), leaving regimes bankrupt and providing the pretext for new and harsher forms of class-biased austerity programmes.

Despite campaign promises and rhetoric, the electoral regimes who took power throughout the continent during this period not only failed to solve the most elementary socio-economic needs of their populations but also to democratise their political systems or even provide the minimum security for the maintenance of everyday life. Instead of more democratic policy making processes, electoral systems have become more non-representative, more divorced from popular needs. Authoritarianism is on the rise everywhere and repression has become a routine feature of civilian rule.

The political response to the collapse of liberal capitalism and the deterioration of party-electoral regimes has not been uniform. Reflecting the volatility of the electorate, conventional alternatives as well as new movements and personalities have surfaced. Past political identities no longer have relevance in the wake of sharp political realignments, largely involving shifts by parties and their leaders formerly identified as centre-left, social democrats to the neo-liberal, centre-right and beyond. At the time, this 'turncoat' phenomenon is not tantamount to a broad rightist shift among the electorate. The presidential elections in Mexico (1988) and Brazil (1989) revealed massive popular support for the leftist candidates. In Brazil, Lula and the Workers'

Party secured an historic 47 per cent (approximately 31 million) of the vote, in Mexico, Cuauhtémoc Cárdenas actually won the election only to have it stolen through PRI fraud. This countertrend to the continent's 'right turn' has expressed itself through both electoral and non-electoral forms, and is capable of escalating into massive confrontations if coherent and organised political movements emerge.

Except for a tiny group of overseas-funded intellectuals, the demise of eastern Europe's collectivist regimes has created no positive groundswell in favour of liberal capitalism. The daily devastation wrought by the free market has had a much more decisive impact on political and economic outlooks than the pro-western, pro-capitalist rhetoric emanating from Moscow and other bloc capitals. More than ever, the vast majority of Latin Americans seek to create national economies that provide secure employment, a social safety net, an equitable income system, and efficient, democratically controlled public enterprises. The market has long since lost its mystique for the urban poor in Kingston, Lima and Caracas; the industrial working class in São Paulo, Buenos Aires, and Santiago; and for social movements throughout the region.

The failure of this latest cycle of electoralist politics and its market-driven economic programmes to improve the life existence of the Latin American masses was most poignantly and accurately captured in the words of a worker in the southern Brazilian state of Paraná at the time of the national congressional elections in late 1990. Arriving at the ballot booth, he handed back his voting card to the returning officer, stating "I hereby renounce this supposed right, which is incapable of staving off my hunger!"

FAILURE OF ELECTORAL REGIMES TO DEMOCRATISE POLITICAL SYSTEM

The transition from military to civilian electoral regimes was prematurely dubbed a 'redemocratisation' process. Yet the political shifts in Peru, Argentina, Brazil, Guatemala, Uruguay, Chile and elsewhere only affected a change in regimes; they were not accompanied by any diminution in the power,

prerogatives, and status of the more basic state institutions such as the armed forces and secret police, the intelligence agencies, the judiciary, the civil service, and the central banks. What immediately became apparent was that while the military had surrendered formal power to the civilians, they still retained a substantial 'veto' power over the 'redemocratisation' process. In Chile, for instance, former dictator general Augusto Pinochet enacted an amnesty law forbidding prosecution of military officials for human rights abuses, stacked the supreme court with pro-military judges, and created an autonomous central bank, personally choosing its members, before handing over power to the elected politicians. Furthermore, Pinochet retains his position as head of the army, and the Allwyn government lacks the authority to remove him or any of the other top military commanders from their posts. One of the civilian regime's first acts was to 'dissolve' the secret police (CNI), only to have its personnel and files reincorporated into the Pinochet commanded armed forces. Likewise in Brazil the generals retain a powerful presence within the political arena by dint of their success in getting a clause placed in the new constitution that defines the armed forces as the 'defenders against foreign and domestic threats'.

Perhaps the most striking illustration of democratic regimes as 'hostages to military power' is the lamentable efforts on the part of the newly elected officials to bring military officials to trial for crimes (killings, torture, kidnappings, etc.) against civilian populations. Fearful of the armed forces' likely reactions, they prefer to formulate and justify policies on the basis of possible responses by these non-elected authoritarians. The Argentine governments of Raúl Alfonsín (1983-1989) and Carlos Menem (1989+) have probably gone furthest in this direction.

In December 1986 Alfonsín introduced a 'Punto Final' law which sought to limit prosecutions of military officers by allowing only 60 days for new charges to be filed. After dissatisfied lower ranking army officers staged a revolt in April 1987, an intimidated regime enacted a 'Due Obedience' law which absolved all those under the rank of colonel from any crimes against civilian

Because they were only following what they believed to be lawful orders. This measure pardoned most of those directly responsible for the thousands of deaths resulting from the so-called Dirty War of 1976-83. Since Carlos Menem's election, this process of accommodation and capitulation to the armed forces has continued apace. In October 1989, he pardoned 280 officers and soldiers found guilty of human rights violations during the Dirty War. In March 1990, to combat daily strikes by workers demanding higher wages and a halt to declining living standards, and increasingly routine supermarket sackings by impoverished slum dwellers, Menem granted an increasingly restless armed forces permission to act promptly to subdue major civil protests, i.e. police powers to repress democratic protests; that same month, he granted military officers wage increases of almost 100 per cent and put into effect a \$ 300 million increase in the military budget.² As his approval rate plummeted from 80 per cent at the beginning of his presidency in mid-1989 to 17 per cent in March 1990, the frequency of secret meetings between Menem and the army high command increased.³ In early October, the steady retreat from prosecution and punishment of those responsible for the Dirty War atrocities continued when Menem announced that he intended to pardon the remaining seven senior junta members, including former presidents Jorge Rafael Videla and Roberto Viola, condemned to life imprisonment by the Argentine supreme court in 1986—despite polls showing that more than 70 per cent of the population oppose such a move.⁴

The parameters of the new electoral politics are, in a profound sense, being shaped by non-elected forces largely derived from the previous authoritarian political systems. Forces which impinge on the most elementary issues defining a would-be democracy, equal justice under the rule of law, are deemed extremist. Except for the trial and conviction of the seven Argentine generals whom president Menem has now promised to release, no civilian government has fulfilled its human rights promises to the electorate: to bring the full force of the law to bear on the military mass murderers of civilian non-combatants. On the contrary, the elected rulers have attempted to ingratiate themselves with the generals and admirals, offering promotions and perks, and partaking of frequent consultations, lunches, and ceremonial occasions. Symbolic gestures to the victims, such as investigations of the deaths and the uncovering of mass graves are accompanied by insistence on 'reconciliation'—amnesty for the executioners and forgetfulness for the victims. Worse still, Chile's new government not only pays homage to the Pinochet military leadership but refuses to release approximately 300 political prisoners jailed during the anti-dictatorial struggle.⁵ In a word, the electoral regimes function with a dual legal system that punishes ordinary citizens and ex-

onerates state officials involved in the most heinous capital crimes.

At the same time as elected regimes have elaborated policies within parameters laid down by the coercive apparatus of the 'old' state they have also engaged in major efforts to dismantle, displace, co-opt and even repress the autonomous social movements that offered the most formidable opposition to the military regimes. A continuation of autonomous popular movement activity is frequently described by government officials as a 'danger to democracy' or a destabilising force, and sometimes accompanied by efforts to amalgamate attempts to democratise policy-making with military conspiracies to overthrow the civilian regime—an approach described as the "theory of the double demons". Following the December 1989 presidential election in Chile, for example, the politics of movement disarticulation moved into high gear: local party functionaries pressured the leaders of the anti-Pinochet mass social movement not to engage in any activity outside of the state framework (*acuerdo-marco*) for fear of endangering the fledgling democracy and provoking the military to re-enter politics. As party machines seek to actively neutralise movement activity and narrow political options, the scope of the political discourse, political action, and policy choices is considerably narrowed. The electoral regimes have become not the vehicle for redemocratisation but essentially transmission belts for transferring the political constraints from the authoritarian state to the population at large.

What the above reveals is that the only manner in which the Latin American political transitions of the 1980s can be described as a redemocratisation process is to ignore the authoritarian parameters and institutional continuities (as well as the substantive socio-economic referents of policy) and the spillover effects of generalised fear throughout the political culture, and simply focus on the electoral procedures and short-term decision-making processes.

The failure of the electoral regimes to democratise the state and make it responsible to the interests of nationally-anchored groups is directly related to another fundamental feature of the transition—the inability of the civilian rulers to stem the growing remilitarisation of political life. In Peru, the Garcia presidency (1985-90) initially promised to reverse the Belaunde 'unleashing' of the armed forces in the war against the Sendero Luminoso and to investigate military human rights abuses. Instead, after limited efforts to assert some control over the military, Garcia sanctioned an expanded role in the war against the rural insurgents—accompanied by a declining interest in controlling abuses perpetrated against the non-combatant population. In early 1989, the government accorded sweeping powers to the military by declaring states of emergency in 36 provinces, including Lima, which placed almost 40 per cent of the population

under the authority of the armed forces. The civilian death toll resulting from the Belaunde-Garcia military 'pacification' programme exceeded 15,000. In Brazil, the country's first elected president in two decades, Jose Sarney (1985-90), spent more time consulting the military chiefs about public policy than the elected parliamentarians. Today, local grassroots organisations are subject to constant repression by the armed forces, the police, and rightist paramilitary groups. In Argentina, presidents Alfonsín and Menem have allowed the military and intelligence agencies to reassume their traditional responsibility for 'public security'. In Chile, the Allwyn government has made no effort to curtail the autonomy of the armed forces or the police (*carabineros*). Not surprisingly, reports of possible military coups have resurfaced with greater frequency as civilian regimes turn to the coercive forces of the previous military dictatorships to cope with unresolved political and socio-economic crises.

Of equal significance, the neo-liberal electoral regimes have employed the armed forces as a basic policy instrument in attempts to privatise economies and enforce class selective austerity payments to overseas bankers and local transnational capitalists. In Venezuela, president Carlos Andres Perez directed the armed forces to put down demonstrations in nine major cities in February 1989, occasioned by the signing of a \$ 4.6 billion loan package with the IMF which obligated the government to enact a series of austerity measures including the removal of food and other basic consumer subsidies. Approximately 300 strikers were killed and more than 2,000 injured.

Without doubt, the most baleful outcome of the 'redemocratisation' process has been the willingness of the electoral regimes to legitimate the military and forgive and forget its past crimes against society. Ignoring the international, as well as local, condemnations of the region's generals who authorised the killings, torture, and disappearance of tens of thousands of civilians, the new 'democratic' rulers undertook major efforts to refurbish the image and role of their military forces. Most have publicly praised their national, patriotic role, even as discoveries of their victims in mass graves are announced on the same day. The most recent example of this bizarre juxtaposition of official praise amid the discovery of graves occurred in Chile in July 1990, and was comprehensively reported in both the pro-Pinochet daily *El Mercurio* and the centre left *Fortin Mapocho*. The policies and practices of the electoral regimes, much more than mere pressure from the military, has once again created strategic imbalances between civilian and military power.

Last, but by no means least, the resurgence of the armed forces as the major arbiter of politics has been further strengthened by agreements between Washington and Latin American civilian presidents to expand the number of US

military bases in the hemisphere as part of the so-called anti-drug war. During 1988 and 1989, the US Army's Special Forces (Green Berets), specially trained Drug Enforcement Agents, and Pentagon military supply specialists were assigned to work with the armed forces and/or police in Bolivia, Peru, Guatemala, and Costa Rica. Following an April 1990 Bush administration decision to authorise a \$ 35 million military assistance programme for Peru (up from \$ 1.5 million in 1989) to expand the drug war and improve the military's counter-insurgency skills in the struggle against the Sendero Luminoso, the Garcia government gave the go-ahead for a US military training base to be established in the Upper Huallaga Valley—the guerrillas' stronghold where more than 50 per cent of the world's supply of coca leaf is grown.⁶

The failure of electoral regimes to consolidate democracy in Latin America is as much a structural as a policy problem insofar as it flows from a series of ideological, institutional, and socio-economic concessions, as well as political agreements, that weakened the authority of the democratic electoral and social movements while simultaneously legitimating and institutionalising the most authoritarian forces in society. In this setting, the neo-liberal socio-economic policies pursued by the electoral regimes were both cause and consequences of the emerging economic crisis, and the subsequent deepening of social polarisation and political deterioration.

FAILURE OF ELECTORAL REGIMES TO ARREST PROCESS OF ECONOMIC DISINTEGRATION

If the transition from military to civilian rule was accompanied by continuities at the level of state institutions and personnel, it produced little or no change in the neo-liberal socio-economic models constructed by the former dictatorial regimes. On the contrary, most elected governments combined a deepening of the processes of privatisation and liberalisation with new constraints on wage and salaried earners. In Argentina, even the most extreme free-marketier general balked at selling off or opening up to private participation virtually every enterprise in the state sector. Yet this is precisely what president Menem is currently seeking to achieve. Dramatically speeding up a process initiated by his civilian predecessor Raul Alfonsín, Menem has signed privatisation decrees affecting the oil fields, petrochemical companies, communications sectors, water supply, electricity, coal, postal and telegraphic services, and ports authority. In Brazil, within a month of his inauguration as president (March 1990), Fernando Collor outlined an economic strategy that included plans to privatise 188 state-owned industries. Since then, he has been systematically placing government-owned corporations on the auction block. To facilitate his

destruction of the public sector, he has already withdrawn practically all protective barriers to the national market and the new hi-tech industries. In Uruguay, the country's elected leader Luis Alberto Lacalle has implemented measures aimed at privatising the fishing industry, the national airline, alcohol production, insurance sales, and port and telecommunications services. In Peru, the new civilian head of state Alberto Fujimori has announced a programme to sell off the petroleum, mining, and metal refining enterprises that account for most of the country's industrial output.

During the decade of ascendant 'democracy', Latin America's per capita gross domestic product (GDP) fell by more than 8 per cent, with some countries (Argentina, Peru, Venezuela, Bolivia) experiencing declines of around 24 to 26 per cent.⁷ The only notable exception to this continental downturn was socialist Cuba whose economy grew by 42.8 per cent and by 33.5 per cent on a per capita basis. Calamitous as the aggregate figures undoubtedly are, they obscure the even more profound income losses that occurred over the 1980s. Minimum urban salaries (earned by over half the region's labour force) fell by 74 per cent in Peru, 58 per cent in Ecuador, 50 per cent in Mexico, 30 per cent in Brazil and 21 per cent in Chile.⁸ Workers throughout the region now scramble to three, four and five jobs just to be able to afford the cost of a basic necessities diet. In Brazil, the purchasing power of the 50 per cent of the population receiving the minimum wage is at an historic low.⁹ In Argentina, which until recently had the highest beef consumption on a per capita basis, unemployed workers knocking on doors demanding to be fed has become a common sight. Between September 1989 and September 1990, real wages in the country's state companies plummeted by an astounding 49 per cent—accompanied by job losses that exceeded one million in the industrial sector alone.¹⁰ In Fujimori's Peru, real wages hover around 1972 levels.¹¹

While the income gap between rich and poor has widened, social sector spending has declined by more than 50 per cent over the past decade. Simultaneously, individual sectors (especially health, education, transport, housing and recreation) and their classes have become more and more 'insulated' from one another. In Argentina today, for instance, the wealthy pay the equivalent of a school teacher's annual salary for three months of private health coverage while state-run women's psychiatric hospital reports (July 1990) the death of 30 patients from malnutrition. In fact, this latter is a continent-wide problem which affects almost half the population in some countries. Doctors, nurses, and medical aids simply lack sufficient drugs and equipment to cope from the resultant illnesses.

Inevitably, those least able to look after themselves have suffered most at the hands of the economic deregulators. Mortality

rates, childbirth deaths, and child malnutrition have risen significantly in recent years in countries like Argentina, Brazil, Peru, and Mexico.¹² In 'redemocratised' El Salvador, infant mortality rates surged during the 1980s because of deteriorating basic services—in particular, the worsening lack of access to safe drinking water. By 1988, nine out of every 10 peasants were being denied this fundamental right.¹³ In 1990, according to the United Nations Economic Commission for Latin America (ECLA), approximately 44 per cent of the continent's population (183 million) were living below the poverty line—an increase of 112 million over 1970. Almost half of this group (88 million) were characterised as destitute or living in extreme poverty. ECLA attributed this growing immiserisation to the dramatic and regressive fall in average income which "marked a tremendous step backwards in the material standard of living of the Latin American and Caribbean population" during the 1980s.¹⁴

This era of plummeting wages, a chronic deterioration in living standards, and negative growth rates was directly linked to governmental policies that facilitated massive transfers of capital abroad. Between 1982 and 1989, multinational corporations and banks feasted: profit remittance and interest payments over this nine-year period totalled an astronomical \$ 281.5 billion. Deducting new loans and investments, Latin America still remained a net exporter of capital to the tune of \$ 200 billion.¹⁵ The logic of the socio-economic model pushed by the electoral regimes—freeing capital (local and foreign) and contracting the public sector—dictated this outcome (which promises to continue) because it obliged them to maintain the international circuits, meaning paying the debt; once that was decided, they had no choice but to promote the export elites at the expense of local producers, and wage and salaried groups. The pillage of the economy was inextricably linked to the impoverishment and polarisation of society.

The most profound subjective consequence of these economic changes has been the accelerated proletarianisation of the professional and middle classes, especially those in the public sectors tied to salaried income. Equally striking has been the de-proletarianisation of the industrial wage labour force: under and unemployment is running at historically unprecedented levels (70 per cent in Lima, over 50 per cent in Caracas, 20 per cent in Buenos Aires, etc), temporary and casual labour, not covered by social legislation, minimum wage rates, or safety conditions in the workplace, has become the norm. The electoral regimes of the 1980s may have granted more legal rights to trade unions but their socio-economic policies have simultaneously emptied the unions and factories of their working members. Indeed, they have presided over the reversion of many major gains achieved

through half a century of class and political struggle.

Almost as striking as the socio-economic failures has been the absence of any public morality. Everywhere political theft of public property has reached monumental levels. In Peru, Alan Garcia's regime (1985-90) has been accused of stealing at least several hundred million dollars—leaving the treasury with a negative balance. In Venezuela the Democratic Action regime of ex president Luchini (1983-88) has at least a dozen former ministers under indictment for stealing billions in oil money—most of whom have fled the country. In Brazil the Sarney regime (1985-90) was universally despised for the massive appropriation of millions of dollars in state revenues for private entertainment and depositing hundreds of millions, if not billions, in overseas accounts. In Argentina, president Menem's brother and head of the senate, had accumulated over a million dollars in an Uruguayan account within three months of taking office. While in Chile, the Alwyn government is not expected to energetically pursue the massive fraudulent multi million dollar sell off of state enterprises to public cronies of Pinochet in the last days of the dictatorship. Wholesale venality, the scope and scale of corruption, by the neo liberal electoral regimes is their practical interpretation of unregulated capitalism—the free market. The scale of public pillage can also be explained by the drying up of private opportunities for enrichment. With the banks taking the bulk share and the established export elites untouchable the public firms being sold off to the private sector and the public treasury remain as the two last areas for private accumulation by the electoral officials. No doubt the new market ethos that encourages this behaviour as the ultimate value is no small factor easing the conscience of hesitant officials.

Privatisation has taken on special meaning under the electoral regimes—in the double sense of both a shift from public to private ownership, and in the practice by high government officials of appropriating (directly or through family or business ties) public resources. The scope and depth of political corruption in the new era of deregulation, privatisation and internationalisation of capital has been well publicised in the cases of Venezuela, Brazil, Argentina and Peru—where officials literally utilised state budgets to grossly expand overseas accounts, appropriate resources destined for public enterprises, run them down and sell off the firms to private associates.

As a result, a great deal of the deficits of public enterprises is not due to the inherent inefficiencies of the public firms, but is in part the result of private appropriations and corrupt subcontracting. (By contrast, in Uruguay, the recent elected socialist government of Montevideo was able to increase income from the city's casinos by 300 per cent in six months, largely, it is assumed, by

honest administration.) The private pillage of public enterprises become a pretext for further privatisation: state corruption is linked at both ends of the privatisation process fostered by the electoral regimes. The result is an economy that revolves around a kind of 'primitive accumulation' in which political officials establish their initial wealth through public pillage and later convert their wealth into capital in the newly privatised sectors.

The electoral regimes have fashioned economic strategies based on the free market that have led neither to a more equitable distribution of wealth in society nor to a bridging of the income gap between the export elites and the wage and salaried groups. On the contrary they have simply deepened the former while consolidating the latter as they actively campaigned to give it ideological legitimacy. Moreover, they have created a highly rigid dual economy: a private sector linked to the international circuits drawing on overseas financial resources and the pillage of the state, and another sector dependent on a shrinking internal market linked to declining wages deteriorating state services and a lack of job opportunities.

ELECTORAL REGIMES AND CLASS STRUCTURE

The peculiarity of electoral regimes and their leaders is that while often the products of class struggles they are quick to deny its relevance once in power. In opposition the electoralists address the class configurations of non democratic regimes, in office, they downplay the links between state and class in favour of a perspective that emphasises the distinctiveness, separateness, and autonomy of each sphere. This ideological shift accompanying the political transition have been particularly acute among the Latin American intellectual classes whose members have often been deeply involved in rationalising, or formally participating in the new regimes. Nonetheless, the latter have had a significance on class structures and, in turn, been deeply influenced by specific configurations of class power.

There are several striking patterns that are common to most of the new (and old) civilian governments of the 1980s. First is the almost total absence of populist policies and redistributive politics. Whatever coalitions of labour, middle class, and business groups exist before the presidential vote, they have no impact on subsequent policy and quickly break up in rancorous conflicts. Second, traditional ideological discourses and historical practices have less relevance in defining the policies of the new electoral regimes than have contemporary configurations of power within which the regimes are inserted. A clear example is the Peronist regime in Argentina. Menem's policies favour overseas bankers and private exporters at the expense of local producers and wage workers, directly repudiating past prac-

tices and ignoring trade union claims of 'betrayal'. Menem is responding to the ascendancy of Argentine transnational capitalists, overseas investors and local exporters, the power configuration inherited from the previous Alfonsín and military regimes. Third, electoral regimes have not been oriented towards transforming the class system or even ameliorating class inequalities, but rather strengthening and consolidating the power at the top, as the only classes capable of developing the economy. Briefly put, the electoral regimes are increasing international mobility for the 20 per cent at the top, while forcing downward mobility for the wage and salaried groups tied to the stagnant economy. In fact, the ability of the outwardly oriented classes to appropriate surplus from the inwardly bound classes is a condition for greater international mobility. These conflicting, but interrelated mobility patterns are mediated by the neo liberal state and electoral regime while the state extracts and transfers surplus from wage/salaried classes to the local and overseas transnationals. The electoral regime legitimises the process by evoking the democratic liturgy.

The major class configurations and class relations are not always the result of the electoral regimes, most of which emerged during the military regime. The policies of the electoral regimes have done a great deal to reinforce the pre-existing tendencies in the class structure.

Several features of the contemporary class structure require special attention. First is the predominance of a class of Latin American transnational capitalists (TNCs) as the major force throughout the continent. The key distinguishing characteristic of TNCs is not whether they are involved in production or not, nor the location of their productive activity, but their access and involvement in international markets which ties them to international capital flows. The ascendancy of TNCs at the top is matched by the marginalisation of important sectors of the working class: the massification of unemployment and of poorly paid, under employed, self employed, seasonal and temporary workers—lacking any of the traditional social security benefits. The polarisation between a cohesive self conscious TNC class at the top and a disarticulated mass of workers at the bottom has had a very dramatic impact on the professional and salaried middle classes: a minority has been able to insert itself into the private networks (ideologues, accountants, lawyers, doctors), while the great majority have suffered severe downward mobility. The downwardly mobile professionals have attempted to cope by turning to multiple employment, and increasingly overseas immigration, as well as toward direct action protests.

The electoral regimes, however, have also institutionalised another set of social actors who reinforce this class system—the international lending agencies who act as

representatives for overseas sectors and investors. In tandem with local TNCs and the technocratic elite of the electoral regimes, these 'external' class actors have played a major role in defining the patterns of class formation, determining which classes gain or lose income and which classes rise and fall in the class system. Hence, the electoral regimes are not merely products of internal class forces, but active agents promoting the convergence of interest between externally based, but locally involved, propertied classes.

The dynamics of this class system have been manifold—making and unmaking segments of classes and diluting the specificities of each class and unit of class. One major development is the growth of a lumpen proletariat, a spin-off from the disarticulated working class and impoverished self-employed. Throughout the region, and particularly in the large urban cities, crime rates are growing at unprecedented levels which the United Nations Economic Commission for Latin America attributes directly to "the marked deterioration in the standard of living of broad sections of the Latin American population...".¹⁶ In countries like Brazil and Argentina, security firms have become multi-billion dollar enterprises. Another development has seen the working class household unit become the basis for a new gender realignment of political influence. As unemployment has hit male household heads the hardest, and as the negative socio-psychological effects have apparently been most strongly felt in that quarter, women and young people have become more prominent in defining class positions in social movements and in spontaneous protests in neighbourhood arenas.

The dual developments of working class disarticulation and deepening social polarisation usually means that the traditional political controls exercised by the electoral party machines and bureaucratised trade unions cease to be effective. Mass spontaneous protests, sacking of stores, street mobilisations, unauthorised strikes, begin to merge as the class identity of the electoral regimes becomes transparent. Whether the polarised class structure will find expression in polar opposite political movements is a question of contingency and political intervention. What is clear, however, is that the electoral regimes and the dominant component parties that comprise them have not established hegemony over society. Their one-sided representation of the 'externally-oriented classes' and the 'downward push' on the rest of the subaltern classes precludes it. The distance, however, between a deteriorating hegemonic political class and an overt political rupture is still vast and subject to numerous byways. The shift from traditional parties to opposition, to protest candidates, to violent reactive protests and widespread disenchantment and a sense of betrayal, reveals a volatile mass in search of new political alternatives that can confront the catastrophes induced by the pragmatists and realists of the *status quo*.

ELECTORAL POLITICS, CLASS POLITICS, AND CRISIS OF MARXIST LEFT

Direct action by trade unions, social movements, and guerrilla forces has been a common response to the integration of the new electoral regimes into the 'old' export economy. The most striking aspect of the resurgent popular challenge is the target: ostensibly 'social democratic' and 'populist' regimes. This reflects the fact that the old electoral elites of the self-styled democratic left no longer have the wherewithal to capitalise on their rhetoric and evoke traditional ties. In Venezuela, tens of thousands of poor urban dwellers poured into the streets to protest the IMF-mandated austerity measures imposed by Carlos Andres Perez in June 1990, in Guatemala, urban groups, peasants, and guerrilla movements mounted an increasingly consequential challenge to the civilian Cerezo regime (1985-90); in Argentina, Peronist public employees unions, whose members have been radicalised by the loss of social status and economic impoverishment, have engaged in prolonged strikes against the Menem regime; in Brazil, organised labour—bank employees, health workers, metal workers, teachers, longshoremen, migrant cane cutters, and others—have participated in strikes against the draconian economic measures implemented by the Collor regime. Apart from an estimated 16 per cent fall in real wages, the civilian government's programme has led to the firing of hundreds of thousands of workers in the private sector and a further 100,000 in the public sector since March 1990.¹⁷ In Peru, successful general strikes against falling living standards, wage levels and services severely undermined the government of Alan Garcia (1985-90); when his successor Alberto Fujimori announced an accord with the IMF which resulted in the immediate removal of subsidies on basic consumer goods and soaring overnight price increases (gasoline increased by 3,000 per cent, milk and bread prices almost tripled, gas and electricity rose eight to twelvefold) the urban slums erupted. The food price rises were subsequently followed by sackings of hundreds of thousands of workers which triggered anti-regime strikes by thousands of teachers, bank employees, petroleum workers, and other segments of the labour force.¹⁸ Even in Chile, Socialist and Christian Democratic unionists have threatened to march on parliament if new labour legislation is not approved, while trade unions affiliated to the Workers' Party in Brazil have organised strikes against compromising municipal governments controlled by their colleagues.

The willingness of the working class and the urban poor to directly confront and challenge the traditional parties and the electoral leaders testifies to the reemergence of class struggle politics in the post-authoritarian era. However, several qualifications are in order. First, most of these movements' demands were part of the social democratic and populist programmes which

the civilian rulers subsequently abandoned. Second, the immediate struggles being fought are largely defensive—to prevent further losses in purchasing power, to resist new price increases, to oppose the withdrawal of food subsidies, to protest the new layoffs and sackings that have accompanied the privatization programmes. In Brazil, for example, where real wages fell by as much as a staggering 216 per cent between January and October 1990, the San Bernardo Metal Workers Union managed to wrest a total wage increase of 82 per cent for its Sao Paulo Ford Motor Company plant members after a 45-day stoppage which ended in late July. Meanwhile, striking national port authority workers, facing massive layoffs, gained concessions including an agreement that the criteria for all future layoffs would be negotiated between the unions and the port management.¹⁹ Third, there has been an ideological shift; the dominant political conceptions have moved away from specific socialist programmatic positions to vaguely democratic ones including support for amorphous 'mixed economies'. What is absent are any specific class configurations that can confront the entrenched, cohesive elites. Fourth, although the popular movements have challenged the hold of the electoral party regimes, they have not linked up to new political organisations. Hence, their struggles become sectoral, immediate and reactive, rather than strategic, anticipatory and state-centred.

In part, the defensive and fragmented structure of the popular classes reflects the post-Stalinist crisis affecting the traditional left in Latin America as well as the repressive content of the state in most of the 'redemocratised' countries. Profound divisions have emerged within the region's communist parties stemming from the disorienting impact of the breakup of the socialist bloc governments, criticism of previous political practices (too accommodating in its relations with the Argentine military dictatorship, too intransigent regarding participation in the Chilean political process), and/or disagreements over the continuing viability of centralised organisational forms (party democracy). The resultant fracturing of these parties in Chile, Argentina, Uruguay, and elsewhere has severely limited their capacity to intervene in current political struggles.

A different kind of crisis affects the other leftist parties. In Chile, for instance, the Socialist Party has renounced all semblance of its reformist class politics history and become part and parcel of the neo-liberal Aylwin regime—in the process, disorienting thousands of party militants in the trade unions and the urban squatter settlements. In Argentina, the Peronist Justice Party is openly supporting the most extreme neo-liberal doctrines being promulgated by any civilian government—and forcing its trade union affiliates to do likewise (thereby undermining their working class and nationalist beliefs) or split from the party. Mid-1990 meetings between populist trade

union and parliamentary leaders revealed the Peronist opposition at a deadend: unwilling to leave the party, yet unable to solve elementary demands within the party.

In Brazil, the Workers' Party is experiencing tensions between an increasingly social democratic leadership willing to sacrifice commitments to structural change in order to preserve electoral opportunities, and militant rank and file trade unionists being increasingly pressured by Collor's neo-liberal economic strategy toward more and more direct action initiatives.

Deep divisions also affect the radical left—the Chilean MIR, the Uruguayan Tupamaros, and other hemispheric revolutionary groups. Some tendencies want to dissolve into local movements, others are more interested in affiliating with the 'successful' electoral parties, while still others want to consolidate and rebuild a revolutionary party.

The crisis in the left and the exhaustion of the historical organisations has to be counterposed to the deepening crisis of neo-liberal capitalism. It is clear that the disintegration of capitalism and immiserisation of the popular classes does not automatically lead to a revolutionary alternative (nor does it preclude it). The bankruptcy of a whole generation of 'anti-utopian', pragmatic intellectuals, many of them ex-Marxists who framed their policies in terms of managing the neo-liberal state and economy has only recently been challenged by a new generation of radical critics. The internal crisis of the political parties of the popular classes has severely weakened the political, organisational and ideological capacities of the oppressed majorities to respond to the prolonged decay of social life: double negativity has not yet generated a positive outcome, at least at the level of state power, though, as we shall describe, the perspectives for the future are mixed.

Finally, resurgent class struggles in the new era of electoral politics still face a configuration of political power in which the military and paramilitary forces remain major actors. Guatemala, El Salvador, and Colombia offer perhaps the most striking evidence of the armed forces' continuing role in what has been aptly described as 'death squad democracy'. Since early 1989, the Guatemalan military and its paramilitary allies have assassinated or kidnapped unionists, politicians, students, diplomats, business leaders, human rights activists, church workers, peasant organisers and other civilian opponents of the elected Cerezo regime on a scale approaching the churnal house violence of the early 1980s. Meanwhile, the civilian president simply refused to respond to this new reign of state-authored terror, seeking instead to consolidate his alliance with the generals to ensure the government ran its full course and to increase the possibility of a Christian Democratic victory in the November 1990 presidential elections. Even the US state

department's 1990 human rights report on Guatemala was forced to concede that the country's security forces had engaged in "extrajudicial killings, disappearances and other serious abuses". The more detailed and authoritative Americas Watch report presented a damning picture of a regime that "tolerated and... apologised for unspeakable abuses" committed by a military that "remains a law unto itself".²⁰

The current situation in El Salvador is no less indicative of the persistence of military power amid the trappings of democratic politics. One of newly elected president Alfredo Cristiani's first acts after assuming the presidency in June 1989 was to order the army's social security agency to deposit its funds in the Central Bank. The generals balked and the president quickly rescinded his order. Since the March 1989 vote, between 2,500 and 3,000 civilians have been assassinated by the armed forces and their death squad allies. The systematic targeting of union organisers, peasant leaders, and church activists in particular reveals the impotence of civilian authority—its unwillingness to reign in a military high command that opposes any institutional reforms, and continues to frustrate efforts to negotiate a settlement to the country's civil war short of the unconditional surrender of the guerrilla forces.²¹

In Colombia, this same mix of elections and political murders has held sway over the past five years. Rightist paramilitary forces and death squads acting with the tacit approval, if not active participation, of the armed forces have been operating throughout the country—financed largely by the narco-drug trafficking cartels. In the two years prior to the 1990 presidential elections, over 2,000 members of the communist party-led electoral coalition, Patriotic Union (UP) were assassinated, in the midst of the election campaign itself, the UP candidate Bernardo Jaramillo was publicly murdered by gunmen acting for the official and unofficial sources of terror in society. A similar fate befell Carlos Pizarro, the presidential candidate of the former guerrilla movement MR-19, following a decision by the insurgents to turn in their arms and participate in the electoral process.²² The chief beneficiary was the ultra-rightist Liberal Party candidate, Cesar Gaviria.

Electoral parties throughout Latin America, keenly aware of the undiminished power of the coercive institutions of the previous authoritarian states, have all but abandoned popular programmatic positions, while attempting to clamp down on the activities of democratic social movements, in an effort to appease and accommodate their armed forces. Electoralism, in the context of an over-represented military presence, has not resulted in consequential structural changes or even redistributive politics in any country where transitions from military to civilian rule has taken place. On the contrary, one could argue that electoral politics in Latin America during the 1980s increasing-

ly revealed itself to be one more obstacle to popularly-based social changes.

ELECTORAL POLITICS AND FAILURE OF SOCIAL DEMOCRATIC LEFT

The great paradox in Latin America today is between the spiralling downswing in the 'free market' economies and the visible right turn of many of the left wing (social democratic, populist, socialist) parties, their political leaderships, and their ideologues—the latter primarily ex-Marxist intellectuals of the 1960s. In countries such as Venezuela, Jamaica, Peru, Argentina, Chile, Guatemala, and Ecuador, this right turn is most evident at the level of the political leadership.

The current presidents of Venezuela (Carlos Andres Perez) and Jamaica (Michael Manley) are the 'prototypes' of this 'turn-coat' phenomena: progressive nationalists and social reformers in the 1970s who have become neo-liberal, quasi-clients of Washington and US financial and investment groups, and uncritical followers of IMF austerity policies in the 1980s. Perez, the leader of the Democratic Action Party, an affiliate of the Socialist International, headed a government in the 1970s that nationalised the Rockefeller-owned petroleum and iron ore holdings, supported lavish social sector spending programmes, and attempted to stimulate agriculture as the basis for creating a strong internal market. In 1990, he remains a social democrat in name only. In all other respects, he has undergone a radical change in outlook, reemerging as an active proponent of privatisation of strategic industries, economic deregulation, an open door for foreign investment, and an enforcer of harsh economic adjustment programmes that sharply reduce living standards through cuts in public spending, freezing wages, freeing prices, and job layoffs.

Michael Manley has assiduously followed the Perez pattern since regaining the Jamaican presidency in late 1988, zealously courting foreign investors while embracing the IMF, promoting the establishment of free trade zones, and instituting a more fundamental privatisation-deregulation of the economy than that undertaken by his conservative predecessor Edward Seaga. Manley's attitude toward Washington also underwent a complete turnabout. No longer the nationalist, he called George Bush "very impressive, very pragmatic, very sensible" and, among other initiatives, offered Jamaican military collaboration with the imperial state in regional anti-drug campaigns.²³

In contrast to Perez and Manley, when Alan Garcia assumed the presidency of Peru in early 1986, he at least began by proposing a series of 1970s-type national and social reforms, including a cap on debt payments, state financial stimulus for national industries, salary and wage increases, and even a proposal to nationalise the banking

system. Unable to secure the active support of the business class for his 'productive revolution' or willing to mobilise the popular classes to move beyond moderate redistributive measures and, increasingly under harsh financial encirclement by the international banking elite, Garcia's team eventually succumbed and reversed their policies imposing orthodox adjustments while engaging in their private version of 'income redistribution'.

The elections of former guerrilla activist Jaime Paz Zamora in Bolivia, Socialist International member Rodrigo Borja in Ecuador, and human rights advocate Vinicio Cerezo in Guatemala continued the right turn trend. Paz, who won the presidency in alliance with the rightist party of former military dictator Hugo Banzer, allowed the US to establish new military bases in Bolivia and set about implementing economic policies that differed little from those of his rightist predecessors. Borja, lauded as the progressive alternative to the conservative, pro-Reagan Febes Cordero regime, followed in the footsteps of Perez and Manley by introducing IMF-austerity type reforms. Of the three, the reformist Christian Democrat Cerezo's transformation was the most bizarre: apart from implementing regressive income policies he began to consistently defend (by denying its involvement) the murderous role of the armed forces and its death squad offshoots as upholders of democracy.

Nor were Argentina and Chile exempt from this right turn phenomenon. Carlos Menem campaigned for the Argentine presidency in 1989 as an orthodox Peronist 'national populist'. However, once elected, he allocated the major economic ministries in his cabinet to representatives of the most extreme right wing big business/multinational corporate sector, and then proceeded to elaborate a sweeping privatisation programme aimed at literally abolishing the state sector. In Chile, the political leadership of Christian Democracy underwent a major shift between the 1960s and the 1980s. Eduardo Frei's government in the latter half of the 1960s enacted a series of moderate reforms in order to modernise capitalism and promote a more equitable distribution of wealth and income. They included an agrarian reform, the 'Chileanisation' of the foreign-owned copper industry (including a buy-out of 50 per cent of the shares of the major US copper firms), and a progressive tax on the upper classes. The recently elected Christian Democratic-led coalition headed by Patricio Aylwin, however, eschews reforms and directs the state's resources to promoting the agro-business export elite, opposes legislation allowing seasonal farm workers the right to strike during harvest season, increases the value added tax (which falls mainly on wage and salaried groups) to fund social programmes, and has expunged the very words 'redistribution', 'agrarian reform', and 'nationalisation'/'Chileanisation' from the government's vocabulary, substituting

the market rhetoric of their former Pinochet-like adversaries.

The 'right turn' of the reformist parties over the past decade has been matched by the presidential victories of a group of rightist political figures 'traditional' conservatives like Salinas in Mexico, Gaviria in Colombia, Lacalle in Uruguay, and Cristiani in El Salvador, and others, such as Collor in Brazil and Fujimori in Peru, posing as 'anti-political' and 'non-traditional' candidates, but whose political antecedents and commitments to a deregulated neo liberal capitalist agenda immediately surfaced as they began implementing 'shock treatment' economic programmes devised by ministers recruited from the big business sector—thus further perpetuating the deepening crisis of the 'free market' model. Indeed, the great irony about this continental shift to the right is how little it has had to do with socio-economic achievements. On the contrary, it has occurred as the effects of neo liberal economic policies worsen social conditions and ensure the persistence of stagnant economies into the 1990s. Nor have the rightist or 'turncoat' parties succeeded in creating a new hegemonic ideology while the 'free market' the 'social market' economy, and other such euphemisms may be currently in vogue, capitalism is still overwhelmingly viewed as an unjust system and imperialism is still commonly used to describe the financial pillage of the continent.

What accounts then for the right turn in Latin America since the early 1980s? Certainly, Washington's relative global decline has not significantly affected its position within Latin America where it continues to exercise over determined influence. Economically, US imperialism is still able to impose enormous burdens and pressures on dissident regimes (witness the experience of Garcia's Peru) through its ability to influence the behaviour of the two major sources of the continent's external funding, the international lending agencies and the private commercial (largely US) banking community. Militarily, its capacity to project its power is as great as ever. The invasions of Grenada and Panama, the use of mercenary forces in Nicaragua and El Salvador, and the recent establishment of new military bases in Bolivia and Peru are sufficient testimony to this reality. Finally, the imperial state's ideological influence has greatly increased since the 1960. Its market rhetoric and interdependence discourse circulates unhindered and is uncritically consumed by broad sectors of the political and intellectual classes. However, the problem with any explanation based on the power of US imperialism is that it was equally applicable during the 1960s and early 1970s when the left political opposition was stronger and extended over a broad universe of discourse.

To understand why this continental wide 'right turn' occurred in the 1980s and what possibilities exist for its reversal it is

necessary to consider a series of historical and structural changes (in both their national and global contexts) that took place in the political and ideological, as well as the socio economic, spheres.

First, the military state-authored repression of the 1970s and 1980s—not least, the tens of thousands tortured, executed, and 'disappeared' by the generals in Argentina, Chile, and elsewhere—had profound, long-term effects on the left and the rest of the opposition movement. It disarticulated grassroots organisations through assassination of the most intelligent, active, and knowledgeable militants. It created a political culture, during and after the bloody purges, permeated with fear and thus inhibited citizens from actively confronting public authority, it 'permanently' changed the balance of power in the state, increasing the weight of the coercive instruments (armed forces, intelligence agencies, police, etc.) in the post military regime society. This legacy of right wing terror and the survival and continuing power of its institutions in the new period of electoral regimes remains a reference point for the parties of the left and the populace at large, strengthening the position of the traditional neo liberals and encouraging the 'turncoat' leftists to accommodate these real power centres. The slow re-creation of a new generation of grassroots leaders and their re-insertion into the trade unions and neighbourhood organisations represents a challenge to this legacy and the political culture of fear, self censorship and internal repression.

Second, the 'right turn' of the former reformist Christian Democrats, social democrats, populists, and socialist in particular was heavily influenced by the socio economic legacy of the military regime. The key components include the predominance of the export elites, reconcentrated banking, agro business and industrial power, the climate of deregulation as a basic condition for any investor co-operation, hyper dependency on the financial circuits and high levels of overseas capital investment by local capitalists. The military's vast restructuring of the economy, society and state in the 1970s and 1980s posed a basic problem for the former reformists: either they had to transform the structure of the economy, challenge the power of export and financial groups, in order to pursue reformist policies or else they had to adapt to the existing configuration of power and pursue policies that would create 'confidence' in these groups, encourage new investments, and thereby avoid a crisis of capital (overseas flight) and the resulting 'chaos'—culminating in the 'demise of democracy' and the return of the military to the presidential palace.

Confronting this dilemma, the old reformers chose the electoral regime and conformity—decisions they termed 'pragmatic' and 'realistic'. Their abandonment of social reforms for the popular classes was dismissed as simply the 'end of utopia'. By equating democracy with public poverty,

these new rightists impoverished democracy. Integration into the new model thus engendered certain political, economic and ideological imperatives that could not be met by any stretch of the original reformist framework. The framework itself had to be discarded and instead of admitting to the need to submit to the new power centres, the political and ideological elites blithely proclaimed that a new 'modern world' had come into being which necessitated discarding of old anachronistic 19th century Marxist and socialist notions.

The alternative to conformity is confrontation and conflict, not concertation. The outcome would have been uncertain but under the alternative path there existed the possibility of a new and more equitable social and economic order—a democracy based on the social movements of the poor not with the generals and bankers. The path of conformity has assured neither democracy, nor equity, nor development and not even re-election—which after all is what the parties of the ex left have come to equate with democracy.

Third, the 'right turn' had to do with the integration of the major research institutes into the western capitalist foundation networks and their subsequent assimilation of liberal political and economic discourses. Several factors explain the gap between the extended crisis of market capitalism in Latin America and the intellectuals' continued support of market regimes and neo liberal economic strategies. Not only are the intellectuals integrated into the organisational matrix of western corporate and state funded circuits (conferences, subsidies, publications, etc), they are no longer subject to the crisis of the local economy because their salaries, perks, and travel funding, reflecting their new class position, are in overseas currencies. Moreover, a condition for employment is agreement to jettison the language of critical Marxism—concepts such as imperialism are taboo. At the same time the analysis of these conformist intellectuals linked to the 'turncoat' parties is deeply influenced by their class aspirations. Looking to become managers of the current crisis, their writings are designed to catapult them into the ministries of the electoral regimes. In Argentina and Chile, for example, the major overseas funded research centres have provided the new civilian regimes with ministerial appointees who served to defuse popular expectations and promote incentives to investors in the private sector.

In other words, as the local economies were transformed under the military regimes into economic appendages of the foreign banks and multinationals, and as a new class of Latin American transnational capitalists emerged, so in the intellectual realm domestic research centres became in effect locally administered 'branch plants' in which the managers formulated research projects within the conceptual framework devised by the 'home office'. The international con-

ferences and publications outlets served to consolidate the linkages and facilitate the transmission of the 'new' market ideology and the formulas for a democracy of poverty.

Fourth and finally, the 'right turn' was linked to changes taking place in the world economy and the perception of those changes by left wing political and intellectual leaders. The demise of eastern Europe's bureaucratic collectivist regimes, the decision of the Soviet Union and China to embrace free market economics and the growing adherence of social democratic governments in southern Europe (e.g. Spain and Portugal) to neo liberal politics has had a major ideological impact on Latin America's communist and socialist parties as well as on other major leftist forces such as the Sandinistas in Nicaragua. Particularly disoriented by these events were those communist party members who had long relied on the Soviet political economic model and have not been able to develop another conception of socialism.

Yet while the decline in socialist bloc economic and military aid and the contraction of markets for Latin exports is no small matter, most of these changes took place several years before the hemisphere's right turn. Furthermore, apart from Cuba and Nicaragua, the changes have not affected the economic patterns in most of the other regional countries. Nonetheless, the constraints on future policy are real but at the same time, have to be put alongside the even greater constraints that the Latin American people are experiencing under the combined impact of US imperialism and neo liberal market policies today and into the foreseeable future. Popular antagonism to perpetual reductions ('adjustments') in living standards has not diminished merely because one or other eastern European government now proclaims the virtues of the market.

This deepening crisis of Latin American capitalism poses the obvious question: can the right turn be reversed? Is a left counter trend visible? What is clear is that since the late 1980s, the region's underlying structural class polarisations have surfaced politically in a number of countries, most dramatically in two of the majors—Brazil and Mexico. The 31 million votes cast for the Workers Party in the 1989 Brazilian presidential elections both exaggerated its electoral strength (member of a left wing coalition) and underestimated its influence among the activist and movement sectors of the society. In key urban centres (industrial factories, favela and lower middle class sites) the Workers Party has become the dominant hegemonic force—its influence extends outward to religious, educational, health, and public sector institutions. It is a counter hegemonic power at the national-state level. Its strategic strength is its roots in the popular movements but its tactical weakness is the strong presence in its ranks of reformist intellectuals and municipal officials

willing to 'pact' with existing configurations of power.

In Mexico, the Cardenas' movement, an amorphous alliance of urban and rural poor, middle class intellectuals and ex PRI party loyalists was able to win the 1988 elections but lost the electoral count demonstrating once again the strength of the permanent state apparatus over the electoral process. Nonetheless, the continued mobilisation of the Cardenas forces on the local level and the large scale resistance to the Salinas regime in a multiplicity of municipalities, neighbourhoods and workplaces suggests that neo liberalism remains largely an elite phenomenon tied to Mexico's transnational capitalists with a strong commitment to president Bush's proposed common market (and state support) as a counterweight to their internal political weakness.

Although the most striking, Brazil and Mexico are not exceptional cases. Progressive socialist mayors and governors have been elected for the first time in Uruguay and Venezuela, increasingly large scale extra parliamentary confrontations are occurring between workers and rightist electoral regimes in Argentina and Peru, the guerrilla movement in Guatemala has assumed the proportions of a national movement now operating in 14 provinces and in El Salvador and Nicaragua rank and file militants are questioning the programmes of the party intellectual—the issues of socialism and democracy, collectivism and capitalism, are being openly debated even as these political formations retain widespread popular support.

The left counter trend reflects the consequential erosion of left wing political organisation and ideology between the objective crisis of capitalism and the neo liberal regimes in power. In other words, the natural polarisations created by the application of neo liberal policy are politicised and organised through the active intervention of parties and activists. Private discontent with neo liberal electoral regimes is mobilised by a variety of political formations—from predominantly electoral parties like the Cardenas movement, to electoral movement parties like the Workers Party to guerrilla groups and direct action movements as in Guatemala and El Salvador. The left counter trend has the capacity to become a hegemonic force if it can avoid the pitfalls of the 'turncoat' left formations that preceded it.

CONCLUSION

The crisis of Latin American capitalism is far more severe and extended than any comparable situation in eastern Europe, but the ruling elites do not depart, mass demonstrations do not end peacefully, opposition intellectuals in office do not purge the state of authoritarian secret police chiefs, the dominant hegemonic power does not gracefully accept changes in the social

system or write off debts. The political elites circulate from military to civilian; the economy lurches from one painful adjustment to another; and when one country, Nicaragua, ousts a US client, Washington finances a prolonged war of intervention and eventually reimposes an electoral client. One priest is killed in Poland and it becomes the basis for an indictment of the entire political system; 70,000 Christian peasants and a dozen nuns and priests are murdered in El Salvador and the leading defender of the Free World can speak of the 'moral crisis of communism' and the 'moral as well as material superiority of free market societies'.

The divergent outcomes resulting from the crises in eastern Europe and Latin America are not the result of the demise of economic systems or the superiority of one system over the other but have more to do with the willingness and capacity of the US to reshuffle political regimes while retaining strategic ties to the underlying authoritarian states and economic elite structures. In contrast to the Soviet withdrawal of support for its client regimes, Washington acts quickly to prop up and buttress regional allies: military aid helps repress dissident nationalists; civilian-military pacts provide the electoral facades that perpetuate the continent-wide pillage. At the same time, Latin America's coercive structures have also exhibited a capacity to hold onto power during periods of transition, thus guaranteeing the continuity of the social system against democratic social movements and mass popular upheavals.

It is these continuities of international hegemonic power, authoritarian state institutions, and the continued concentration of economic power in the outward looking elites that make such a mockery of proposals to learn from the 'Swedish model'.²⁴ Generals and bankers are not going to negotiate the large-scale, long-term transfer of wealth from overseas accounts into social welfare programmes, now or in the near future. Elite negotiations with the electoral politicians provided the political class with the freedom to try their hand at managing the existing model, pacifying the masses, securing overseas loans and keeping up interest payments. The electoral elites have set out to prove that they can manage the existing system better than their authoritarian counterparts: that they can better renegotiate the debt—and maintain payments; that they can run popular elections that would not impair the confidence of the investor elites.

Initially they succeeded, but for a brief historical moment. By the end of the 1980s, electoral regimes were deeply mired in chronic stagnation and the electorate was rapidly losing confidence in one political option after another; one anti-political personality after another. The major reprieve of the system was the very severity of the crisis: the struggle for day-to-day survival was exhausting the populace and forcing

them to turn inward to primary and immediate groups and networks. What new electoral 'options' will appear to perpetuate the political charade? One is tempted to speak of the 'end of neo-liberal capitalism' as the western pundits associate market ascendancy in the east with the 'end of socialism', but that is too easy, fundamentally wrong. The road to transcending the economic, political and moral bankruptcy of capitalism in Latin America is long and arduous. The organisers of the death squad still command the armed forces and they have been carefully nurtured by the incumbent electoral politicians. The economies are tightly chained to the international financial networks: ruptures at one end provoke reactions at the other. Industrialists have factories in Latin America but their capital is invested abroad. When change comes, it will not be easy nor will the initial measures restructuring the economy toward meeting popular social needs be painless: there will have to be a massive shift of resources from the upper 20 per cent to the rest, and that will certainly be resisted to extremities. The elites which have exhausted economic and political options do not simply concede the game as lost and turn philosophical. Irrationality is already increasing: evident in the obsessive and single-minded pursuit of further austerity measures against a whole people which literally has nothing left to give; in the monomaniacal pressures to continue interest payments despite sky-rocketing infant mortality rates and generalised hunger.

If socialism has a future (independently of the organisational capacities or incapacities at any given moment, the deflection or retreat of this or the other generation of intellectuals), it is because it is the only possible way to confront the irrational tide of market madness that threatens to defend general misery with unrestrained violence.

JOURNAL OF INDIAN SCHOOL OF POLITICAL ECONOMY

Editor - V. M. Dandekar

JOURNAL OF INDIAN SCHOOL OF POLITICAL ECONOMY is devoted to a study of the Indian Economy, Polity and Society. Emphasis is on reviewing developments since Independence with roots in the British administration where relevant. When a review is based on statistical data, the policy is to present full statistical data base. Beginning with 1991, we have introduced a new section called Documentation in which we publish official documents which are not readily accessible. The Journal is intended to be a quarterly. However, in the first year, 1989, we brought out only two issues, and in 1990, only three issues. Beginning with this year, we expect to bring out four issues. Jan - March and April - June 1991 issues are already out.

ANNOTATED BIBLIOGRAPHY

Vol. III No. 3 (July-September 1991) issue will appear in October 1991. The Journal publishes Annotated Bibliography of Books and Articles on Indian Economy, Polity, and Society, published after January 1, 1986. Authors are requested to send their entries with full details of publication and annotation not exceeding 250 words for books and not exceeding 100 words for articles. Use separate sheet for each entry.

Address : Arthabodh, 968/21-22, Senapati Bapat Road, Pune 411 016.

Forces of Production and Agrarian Change

Gail Omvedt

The Political Economy of Agrarian Change: Nanchilnadu, 1880-1939 by M S S Pandian; Sage, New Delhi, 1990; pp 192, Rs 175

THIS concisely written study by Pandian breaks new ground in the history of agrarian relations in one important respect, by taking into account the 'ecological' factor (though Pandian does not refer to it as such). Rather, he begins with a discussion of various forms of explanation for the limited impact of the 'green revolution', placing himself firmly within the 'political economy' school which emphasised exploitative agrarian relations and changes in these as central, and which was expressed in the now-famous debate on the 'mode of production in agriculture'. But in doing so Pandian makes several important points in a critique of this debate: most of the participants did not study the concrete reality of Indian agriculture, they neglected the analysis of the forces of production in agriculture and simply accepted the bourgeois notion that growth of the forces of production could be measured in terms of increasing use of tractors, tubewells, HYVs, etc. and they did not deal holistically, concentrating on agriculture alone and writing as if a mode of production could be located here without exploring the interconnections of the agrarian economy with the rest of the social structure.

Pandian's aim is to remedy these gaps: proceeds with a detailed analysis of pre-independence agrarian changes in Nanchilnadu, an area comprising two talukas now in Kanyakumari district of Tamil Nadu but previously part of Travancore state. In fact the area is a semi arid one with low and irregular rainfall, but it had become a prosperous centre of wet rice production due to traditional irrigation works dating back as much as a thousand years. Water both in terms of rainfall and irrigation is thus crucial 'productive force' for Nanchilnadu agriculture. So were the then vast areas of surrounding forests, dry lands (grasslands) and tanks, which had functioned for the peasants as 'commons'—that is, lands resources which they had some degree of collective control over and access to for securing fodder, green manure, agricultural implements and other productive inputs.

The study makes it clear that much of what is being 'discovered' only now as a negative environmental consequence of capitalist development—water deprivation, the negative consequence of 'big dams' (more precisely ill planned irrigation projects), destruction of the commons, deforestation—dates back to the colonial period. Thus, not only did the Travancore state (under pressure from the colonial rulers) extract higher and higher and ever more rigid surpluses from the peasants in the form of land revenue, it also engaged in ill fated

grandiose (for its time) irrigation projects such as the Kodayar dam, it pushed wet rice cultivation recklessly onto ever large areas of land that had been under dry land cultivation and grazing use, and it increasingly 'reserved' the forests, hoping to use these for commercial purposes. Thus, in addition to having to pay land revenue in cash, peasants were also forced onto the market for inputs which previously had been freely available to them from the 'commons' around their villages. Thus without showing any dramatic event of environmental degradation, Pandian stresses the ongoing degradation—from the peasants' point of view as well as that of 'nature' as such—of the conditions of production of agriculture and its role in the exploitation and impoverishment of the peasantry.

As he sums it up: "(a) the peasants' free access to forests and tank beds was removed by the state and thus they ceased to be common property resources, (b) the effectiveness of irrigation as a productive force was reduced through various acts of the state, like the over utilisation of the Kodayar dam, sale of tank beds and disruption of water users' organisations, (c) the remission of land revenue during times of crop failure was abolished, (d) the mode and time of revenue collection were altered in favour of the state and against the peasants, and (e) surplus extraction from the peasants by the state was intensified" (p 149). As a result, peasants were forced to increasingly sell their crops in the market in a period in which prices were dropping drastically. Heavy indebtedness, loss of land to a class of absentee landlords, and stagnation of agrarian technology was the final result (p 170).

Along with this Pandian examines peasant responses, noting that while there was a good deal of individual resistance, a peasant movement as such was very weak. He gives two reasons for this. First, there was little landlord peasant antagonism since inter-village relations (payment in kind to the landlords by the tenants, remission of rent during bad harvests) still were relatively traditional—as he notes, "the landlords themselves shouldered the burden of declining prices as they paid the land revenue in cash" (p 164) and it was the community as a whole which was losing its access to common property resources to the state, which "characterised the state as the first accused in the eyes of the peasants" (p 164). Second, the state successfully maintained a paternalistic relation with the peasantry, particularly since the Travancore administration had a Tamil association for this Tamil-speaking peasantry (pp 165-69).

Though he has not dealt specifically with caste or gender issues, Pandian has thus given a relatively holistic analysis of agrarian change in Nanchilnadu which, it can be argued, does not only fill in some of the gaps in a 'mode of production' analysis, but breaks the framework of the debate and transcends it quite thoroughly. Like all good studies, Pandian's work provides answers to some questions—and raises further ones. These perhaps would have become more clear if he had been able to do what he writes in his introduction he had hoped to do—carry the analysis through to the present. The questions are as follows:

—As Pandian shows, peasants were forced into the market economy, according to him "this form of exploitation which is being mediated through the product market rather than through the labour market is a feature of pre-capitalist socio-economic formations" (p 157). This is an assent to the basic assumptions of most of the 'mode of production' debate participants—that *true* capitalism in agriculture means a process of differentiation that drives peasants off the land and produces the two contending classes of landless labourers and capitalist farmers. But is this an adequate analysis of capitalism? Should we not rather say that capital accumulation is carried on through bonding the peasant into producing cash crops for the market at prices which amount to a high level of exploitation of peasant and agricultural labour power?

The question of land alienation is related to this. Pandian argues that substantial loss of land to absentee landlords was a significant result of the processes he describes. Yet he has not given substantial evidence for this, and as he himself notes, Nanchilnadu "is today characterised by the domination of petty peasants" (p 57). In other words, the overall historical process has acted to maintain peasants as exploited rural producers. Analysing to what degree this is true and why would require a longer historical scope and perhaps a wider geographical scope or study.

What is the role of indebtedness to the state? Pandian sees indebtedness to moneylenders as playing a crucial role in exploitation and land alienation, but he seems to believe that provision of credit by the state would have remedied peasant problems. This appears to exempt the state from any participation in exploitation. Today, when a significant shift at the all-India level has led to the replacement of private moneylenders of all kinds by state institutions (co-operatives and banks) as providers of 'credit' (from the peasants' point of view it is 'debt', from capital's point of view it is 'credit'; the change of language is significant here), this is a crucial issue. Does not indebtedness to the state also function to subordinate the peasants' production process to the needs of capital?

—Finally, why exactly was there no peasant resistance? Pandian effectively shows that, even if landlords or big farmers benefited

from integration into the market, the main exploitation of the peasantry was by the state. Now, resistance at a collective movement level requires mobilisation—a mobilising force with some conscious ideology. But, the major mobilisers of peasants and agricultural labourers from the colonial period to quite recently—communists and socialists—worked with an ideology that did not comprehend the processes of exploitation which Pandian has shown. That is, they ignored environmental issues, did not understand the peasant labour process, and believed all fights should be directed against local exploiters—landlords, capitalist farmers or moneylenders. Peasant struggles on forest issues or land revenue issues—that is, against the state—had to take place during the colonial period under Gandhian or other non-communist leadership.

The theoretical framework which underlay the ideology of left organisers is more or less the same as that underlying the 'mode of production' debate. What Pandian's analysis raises is the very basic question of whether this framework is adequate for an understanding of the impact of capitalism (both in

its colonial form and today) on agrarian structure.

Finally, it may be said that the points which Pandian does make in his critique of this debate are interlinked. The participants, by and large, had little concrete study of the Indian reality, ignored the issues of the forces of production (technology and environmental issues) and did not take a holistic viewpoint partly because they looked at the issue from the view of capital. Capitalism fragments the production process, treats nature as a 'free good' without being concerned about the consequences of environmental degradation, rampantly extracting natural resources at no cost or low price for the purposes of accumulation. From the point of view of the peasants themselves, the production process cannot be fragmented, environmental issues, whether land degradation or access to common resources, cannot be ignored, and exploitation is exploitation whether it is at the hands of the landlord or the state and its functionaries. Studies of Indian agricultural change need to proceed more from the viewpoint of the toilers themselves—men and women both. Pandian's study is a good step in that direction.

Hobson's Choice

Saad A Saidullah

India Wins Freedom by Maulana Abul Kalam Azad, Orient Longman, 1988, pp xiv + 283, Rs 75 (pb), Rs 125 (hb).

Abul Kalam Azad by Ian Henderson Douglas, Oxford University Press, 1988, pp xi + 358, Rs 230.

India Wins Errors by Rajmohan Gandhi, Radiant Publishers, 1989, pp x + 108.

"AZAD" wrote Douglas, "in death as in life is alone." However, as the political has continued to encroach upon the religious—of which Azad was a unique amalgam—other graves have been added to that *muidan* between the Jama Masjid and the Red Fort. The omission of this fragment of information is perhaps the only one in Gail Minault and Christian Troll's revision of the 1969 Douglas doctoral thesis. Though the Nehru 'shatabdi' eclipsed Azad's centenary (he would not have begrudged that to his "friend and comrade"), it was suitably marked by the release of the much talked about 'thirty pages'. An unseemly court battle over, these have finally seen the light of day and we have Azad's complete account as 'old to Humayun Kabir'.

Just as the edited version had provoked Abdul Waheed Khan to present "the other side" (Pakistani), the unedited has provoked Rajmohan Gandhi to convert for "many are liable to recycle material from *India Wins Freedom*". The controversy does not appear to have noticeably diminished the prominent place Azad occupies in political imagination.

The artistic temperament that drove Azad "to go in the evenings to the Taj Mahal to play his sitar" appears to have led him, at times, to improvise on his life story. He specifically had to disown the legend that

he had attended Al Azhar even though it may have been construed from his remarks to Mahadeo Desai. But even after such deficiencies are allowed for, a noble edifice remains. For there is no denying the brilliance of his first rate mind, erudition, prodigious early accomplishments, sagacity, innovativeness in devising enduring institutions, and, above all, his political judgment. He is near enough to us in history for us to know this, so, his considerable achievements need not be repeated *ad nauseam*.

Rajmohan Gandhi asserts, "Remove him from history—the drama of Hindu-Muslim partnership in the movement for independence is then robbed of its Muslim protagonist." But to fall into the trap of this imagery is to ignore the reality that the Maulana symbolised and also injects artifice into everyday life. For every Azad and Khan Abdul Ghaffar Khan there were tens of thousands of Amtus Salaams and Khudai Khidmatgars. There were also many among the ulema who spoke against British imperialism before it became fashionable to do so, perhaps, because this group was drawn largely from the artisan class that European manufactures destroyed. Given all this the unity of religious communities was not a farce of a partnership for greater profit. It

became that, much later, to Azad's disgust.

One of the major hindsight provided by Azad is that the Congress as an organisation and many of its leaders in person were not above making communal hay while the sun still shone on the British empire. Thirty years later, from his grave, he testifies to his belief in the veracity of the stories about the side-lining of Nariman in Bombay and Syed Mahmud in Bihar. He believes that that does not in any way mitigate Syed Mahmud's, later, secret correspondence with the viceroy to secure his personal release. It is equally significant that Azad omits the account that Douglas provides of his own steadfast refusal to avail himself of the offer to let him visit his wife on her deathbed. His abnegation is complete. And in the legal wrangling over the publication of the sealed pages we had a glimpse of his relatives as they appeared through the media—ordinary Muslims following lowly trades. (It is in sharp contrast to most politicians, particularly that of Rafi Ahmad Kidwai's clan which appears to have levitated to dizzying heights on the magical power of his name.) Azad's revelation (how it must have galled him to admit there was an element of truth to Jinnah's description of him as a "showboy" and description of the Congress as a "Hindu" party) is confirmed by Mahatma Gandhi's use of religious idiom, the Khilafat movement and the Nehru chant of *gai matri mai* which were all mixed signals that the Congress used to mobilise from the religious communities.

In his monograph Rajmohan Gandhi uses textual analysis rather than a contextual approach. He, therefore, subjects all the later additions to close scrutiny. One cannot summarise his 120 page commentary without doing it injustice. But if we take one of the shortest passages with the shorter commentaries we have: "We therefore took steps for bringing soldiers in from the south more rapidly" [Azad]. Prima facie the word "we" suggests a collective decision—whether by the cabinet or Mountbatten's emergency council is uncertain. Rajmohan Gandhi, however, finds it difficult to permit such a role to Azad. He baldly asserts, "There is evidence, however, that it was Patel who brought in soldiers from the south." No such evidence in the shape of government orders is however presented, but, he blithely adds, "Controlling disturbances was after all the function of the home minister." All this implies is that the guilt of the deaths of millions lay on the head of Sardar Patel. He adds equally unconvincingly, "K Santhanam who was in Delhi in 1947 has recorded, 'The Sikh and Rajput soldiers who were supposed to protect Delhi indulged in attacking Muslims and though the Sardar was supposed to be anti-Muslim, he felt about the atrocities against the Muslims as much as he felt about the Hindus in Punjab.'" What access one K Santhanam had to the private universe of emotions of the Iron Man is unclear. Such "new history" is derived from a none too "new source"—a commemorative volume entitled *This was Sardar*. The concluding remark, "It was only when the Madras Regiment which

he [read 'Sardar Patel'] had summoned had come to Delhi that he felt secure'. Surely this begs the question whether the Muslims of Delhi, rather than the Sardar, were to feel secure and protected.

If one were to fight fire with fire one may turn Rajmohan Gandhi's, "Azad... blames Patel when he is not there to defend himself" to Azad's defence and claim Rajmohan Gandhi attacks Azad "when he is not there to defend himself". Such linguistic gymnastics might impress, but only momentarily. Arraigning texts against texts is good exegesis but poor history.

The overpowering message of Azad is that, in his judgment, partition was *not* inevitable. It could well have been averted. Indeed it came close to being avoided. It was not a tragedy in which the dice was loaded by a Shakuni (unless one believes in a conspiracy theory under which Edwina Mountbatten seduced Nehru to accept the plan in order to legitimate in modern international law the division of countries on religious grounds to appease the memory of her Jewish grandfather Sir Ernest Cassel who "battled his way to immense fortune and through his role as private banker and financial adviser to the future Edward VII lodged himself in the innermost temples of the Establishment") though its results were more gory and enduring than the *Mahabharat*. We had a choice then as we do even now.

Recent demands for greater provincial autonomy, in Punjab and Kashmir in acute form, and the collapse of the Soviet empire's myth of integrating nations through economic means rather than politics that ensnared Nehru and a whole generation, today militate in favour of Azad's concept of a looser federation. That a scheme he advocated so many years ago has relevance for our own times says much for Azad's political acumen.

Azad believed, "The basis of partition was enmity between Hindus and Muslims. The creation of Pakistan gave it a permanent constitutional form. Nevertheless the die is cast. The new state of Pakistan is a fact. It is in the interest of India and Pakistan that they should develop friendly relations and act in co-operation with one another." This also is of tremendous relevance. With the integration of national economies of politically autonomous nations and the emergence of supranational economic states, there is scope for cooperation among the nations of South Asia, especially given the complementarity of their economies.

Finally, Azad was revolted by the suggestion that the minorities in the domain of either country be held as hostages for the good conduct by the majority in the other state. It was repugnant to him that the world be split into Muslim (Darul Islam) and non-Muslim (Darul Harb) any more than pure (Pak) and impure because he fervently believed that the entire world created by god was his mosque. He realised, which few Muslims do even today, that for the foreseeable future Islam must come to terms with its role as a sept in the house of unbelief (Darul Harb).

New from **SAGE** Publishers of Professional Social Science

COMMUNICATION FOR DEVELOPMENT IN THE THIRD WORLD

Theory and Practice

SRINIVAS R MELKOTE

Although the perspectives concerning the role of communication in development have changed since the 1950s and 1960s, the need for development communication remains as important today. This book provides a concise historical review of the field of development communication, and a comprehensive discussion of theory and practice in this field since the 1940s.

"The present volume is organized in terms of historical eras and is very comprehensive. While the central interest is the role of communication in development, the wider context of communication (such as colonialism, religion, militarism, and technology) is also treated. The encyclopedic nature of the book is indicated by the fact that even though I am a specialist in this field, I learned a great deal from reading it. This book will be useful to scholars and students of communication for development, to officials in charge of development programs, and to others who wish to understand an important paradigm shift in a field of great importance to social science, and to the world."

— From the Foreword by
EVERETT M. ROGERS

Karnataka State Financial Corporation

25, Shankaranarayana Building, Mahatma Gandhi Road, Bangalore - 560 001.

FRIENDS,

It is my pleasure to welcome you all to the 32nd Annual General Meeting of your Corporation. I am very happy to report the excellent performance achieved by your Corporation in all the key operational areas.

ECONOMIC REVIEW

The year 1990-91 was marked by a moderate overall growth in the State economy. There has been a marginal fall in agricultural production compared to previous year. Particularly food grains production is expected to decline to about 64 lakh tonnes during the year from 71 lakh tonnes achieved in 1989-90. The growth in industrial production is anticipated to be moderate at 4 to 5 percent during the year. There has been a marked increase in the production of silk fabrics and wood oil saleable steel sugar and iron ore as compared to the corresponding period of last year.

A new industrial policy was announced by the Government of Karnataka effective from 1st of October 1990. Notable features of this policy are major concessions for new industries incentive packages to employment oriented rural industries and dispersal of industries to backward areas.

KSFC as a regional development bank has a major role to play in the implementation of the industrial policy of the State Government as has been done in the past.

WORKING RESULTS

I am happy to inform that your Corporation has registered yet another commendable performance during 1990-91. During the year under review the Corporation generated a gross revenue of Rs 61.16 crores on cash basis as against Rs 51.52 crores during 1989-90.

The working of the Corporation during the year 1990-91 resulted in a net profit of Rs 9.01 crores before providing for taxation as against the profit of Rs 8.30 crores in the previous year.

OPERATIONAL HIGHLIGHTS

The performance of the Corporation against the targets set for 1990-91 is as follows:

PERFORMANCE OF THE CORPORATION

(Amount in Crores)

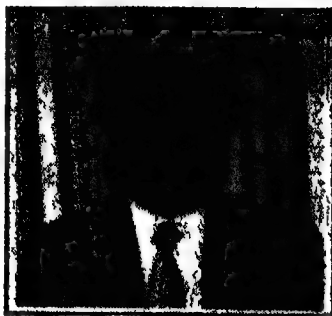

| Sl No | Particular | Target | Achievement | Achievement % |
|-------|---------------|--------|-------------|---------------|
| 1 | Sanctions | 207.00 | 258.87* | 125.05 |
| 2 | Disbursements | 164.00 | 190.71 | 116.27 |
| 3 | Recovery | 125.00 | 137.22 | 109.78 |

* Includes bridge loan of Rs 7.78 crore

The financial assistance provided by the Corporation during the year is expected to generate employment for 4.09 lakh persons. Total investments catalysed by the financial assistance is expected to be around Rs 418 crores and the value of output from these investments is estimated at Rs 1,255 crores.

CLEARANCE OF APPLICATIONS

The average time taken for clearance of an application was 21 days during the year as against 22 days in the previous year indicating the efficient and systematic handling of cases.

Sri. J. Alexander, IAS
Chairman

FLOW OF ASSISTANCE

In consonance with the Industrial Policy of both the Central and State Governments the Corporation laid emphasis on dispersal of industries to backward areas increased assistance to small scale industries and rehabilitation of sick units.

1 ASSISTANCE TO BACKWARD AREAS

During the year the Corporation sanctioned loans of Rs 113.65 crores to 466 cases in backward districts as compared to Rs 89.46 crores sanctioned to 4710 cases during 1989-90. About 56% of the cases sanctioned during the year are in backward areas and amount wise 45% assistance is availed of by backward areas.

2 ASSISTANCE TO SMALL SCALE SECTOR

The Corporation continued to increase the coverage of small scale industry sector. During the year an amount of Rs 166.98 crores has been sanctioned to 6185 cases in the SSI sector as against Rs 125.70 crores to 6060 cases during the previous year. Nearly 67% of the total financial assistance extended during the year is availed of by SSI sector. The cumulative assistance to the SSI sector amounting to Rs 773.67 crores was sanctioned to 37,667 cases which is 68.7% of the total sanctions in terms of amount and 79% in terms of number of cases.

3 ASSISTANCE TO LOCAL ENTREPRENEURS

It is heartening to note that 99.66% in terms of number and 96.53% in terms of amount has gone in favour of local entrepreneurs. 8256 local entrepreneurs were assisted to an extent of Rs 242.19 crores during the year.

4 ASSISTANCE TO RURAL ENTREPRENEURS

To help artisans and village and cottage industries in rural areas Rural Industrialisation scheme was introduced by the Corporation two years ago. During the year 1201 entrepreneurs were provided with an assistance of Rs 6.90 crores as compared to Rs 4.67 crores sanctioned to 729 entrepreneurs in the previous year. The cumulative assistance under the scheme stood at Rs 10.98 crores to 2008 entrepreneurs.

5 SINGLE WINDOW SCHEME

Single Window Scheme introduced two years ago for providing both term loan and working

capital is becoming popular among small entrepreneurs. During the year 876 entrepreneurs have availed of Rs 26.37 crores and the cumulative assistance under Single Window Scheme stood at Rs 41.05 crores to 1494 cases.

6 REHABILITATION OF SICK UNITS

The identification and rehabilitation of potentially viable sick units continues to be a thrust area. During the year 201 units involving an assistance of Rs 9.65 crores were rehabilitated. Since inception of refinancing scheme for rehabilitation of sick units a total number of 1148 units have been provided assistance aggregating to Rs 46.58 crores.

PROMOTIONAL AND DEVELOPMENTAL ACTIVITIES

KSFC as the principal financial institution in the State has taken the leading role in organising number of promotional activities on its own and in association with other developmental agencies. During the year as many as 728 promotional programmes were conducted by the Corporation benefiting 56,185 entrepreneurs.

TARGETS FOR 1991-92

The Corporation has set the following targets for the year 1991-92:

| | |
|---------------|------------------|
| SANCTIONS | Rs 244.20 Crores |
| DISBURSEMENTS | Rs 239.84 Crores |

ACKNOWLEDGMENTS

I wish to place on record my grateful thanks to the Government of Karnataka Department of Finance Industries and Commerce for the continuous co-operation and assistance rendered by them. I am thankful to the Industrial Development Bank of India (IDBI) and Small Industries Development Bank of India (SIDBI) particularly for the valuable guidance and unstinted support.

May I place on record the support and co-operation extended by institutions like RBI KSSIDC KSIIDC DICs KEB KIADB TFCOSK LIC SISI NSIC Apex Bank Commercial Banks TDCI IRBI Canbank Financial Services and CTD. I wish to thank the voluntary organisations like KASSIA LIONS CLUB ROTARY CLUB and AWAKE for their contribution in the Corporation's developmental activities.

I acknowledge the invaluable services rendered by Sri S B Muddappa IAS and Sri C Gopal Reddy IAS during their tenure as Chairmen of the Corporation.

I would like to compliment the contributions made by the outgoing Directors Sri A Sengupta Sri V K K Gore Sri Philipose Matthai Sri A Ravindra Sri R C Rai Sri S Thiagarajan Sri S Ganesh Sri S Rajagopal and Sri Y. Vishwanatha.

My sincere appreciation to the entrepreneurs for the trust and confidence placed by them in our Corporation.

Finally the efforts put in by the Managing Director Sri Y K Puttasome Gowda and the officers and the officials of the Corporation need to be specially mentioned and I take this opportunity to express my deep appreciation to them.

Bangalore

Excerpts from the Chairman's Statement at the 32nd Annual General Meeting held on 29th July 1991

Capital, State and Petty Trading in Calcutta

Nandini Dasgupta

The rapid growth of small-scale economic activities such as petty trading, in most third world cities is generally attributed to the dynamism of the urban centre and its ability to attract capital and labour. Calcutta, however, has followed a different path of change, for while it was abandoned by foreign and indigenous industrial capital soon after independence, the continuing rural-urban disparity attracts large influxes of workers to the city who have little choice or scope for mobility, operating as they do within the constraints of persisting stagnation.

This article argues that at the sectoral level, the case of Calcutta shows the kind of capital which dominates determines the path of change for the dominant mode of production, and also the nature and form of petty commodity activities articulated to the dominant mode.

THIS paper examines the relations between capital, the role of the state and the growth of petty trading in Calcutta. The relations between the state and the different types and segments of capital is seen to affect petty trading at sectoral and sub-sectoral levels. The initial flight of capital strengthened by the anti-capital stance of the Bengali politicians led to persisting stagnation and heightened the importance of petty trading in Calcutta's stagnating economy. At the sub-sectoral level, certain segments of commercial capital influenced the administration of the Congress government during the 1970s to limit the spread of this sector, shaping all subsequent policies towards this sector. This paper shows that the needs of the workers of this sector has never been a factor at the policy level.

Petty trading has been one of the most rapidly growing economic activities in Calcutta's urban economy in the last two decades. This is neither unexpected nor surprising for it is a trend observed in nearly all major third world cities in the post-independence period. The growth of such small scale activities in these cities is generally attributed to the dynamism of the urban centre and its ability to attract capital and labour. While the capital finds lucrative investment in capital intensive activities, the excess labour moves into labour intensive, low productivity and low income activities. However, a dominance of the urban economy by industrial capital, foreign or indigenous, is implicit in this model.

Calcutta, in the post-independence period followed a different path of change. Unlike most third world and other Indian cities, Calcutta was unable to strengthen its links and dominance established in the colonial period, as it was abandoned by foreign and indigenous industrial capital soon after independence. Large- and small-scale capitalist production first grew very slowly, then stagnated and finally declined. But the continuing rural-urban disparity attracts large influxes of workers. As opportunities for income generation got increasingly restricted, the workers looked for alternative means of livelihood. Though the inherent character

of petty trading in the third world cities is not questioned, it is important to note that in most cities workers are placed in a dynamic growing centre where the scope for vertical and horizontal mobility is real. In the case of Calcutta there is little choice or scope for mobility as workers operate within the constraints of persisting stagnation. In this structure of limited employment opportunities and limited mobility in Calcutta, small-scale activities acquire greater significance. Among such activities petty trading becomes a real alternative. Further, the high level of persistent unemployment among the educated Bengalis is forcing a class realignment. Unable to even reproduce their conditions, they are attempting to enter the urban economy at a lower level, through petty trading. It is thus a source of livelihood to illiterate migrants from other states, to unemployed resident urban workers, a large number of whom are educated, to migrants and commuting workers from the neighbouring districts. Thus this paper argues that at the sectoral level, the case of Calcutta shows that the kind of capital which dominates determines the path of change for the dominant mode of production, and also the nature and form of petty-commodity activities articulated to the dominant mode. Hence a study of the role and importance of a petty commodity sector in an urban economy needs to examine the relations between the state and different types of capital present.

At the sub-sectoral level, the politics of petty trading shows that while the scope of this activity increased because of absence of industrial capital, sections of commercial capital created conditions for its growth. While the mahajans who established links with petty traders stood to gain, other sections of commercial capital resisted its growth. In the early seventies, the latter groups were obviously powerful enough to influence state attitudes at administrative level. The Congress government's stand on the issue of 'hawkers'¹ and the pattern of eviction of hawkers reflected neither a concern for the workers of this sector nor an understanding of the socio-economic processes affecting the city. The state's attitude

at that time and the constant threat of eviction slowed down the process of consolidation and stabilisation of the petty trading units. This not only forced a greater politicisation of the sector, particularly of urban middle class workers, but also resulted in the next government in power (the Left Front) adopting a stance contrary to that of the Congress. In other words, the non-interventionist policy of the Left Front government towards the petty traders was politically convenient. The government's present policy reflects neither the needs of the sector nor an understanding of the socio-economic processes affecting the city. At the sub-sectoral level it is therefore argued that to explain the role of the state and its influence on the petty commodity sector, it is essential to understand the relations of the state with different types of capital and the political priorities of the government. It is these relations and priorities which are fundamental in shaping the activities of the petty commodity sector.

The purpose of Section I is to show that it is the combination of an absence of a Bengali capitalist class, the negative relations between the state and industrial capital which did remain and the inability of either to influence the decision-making at either the national or regional level which resulted in persistent stagnation which gradually choked off alternate avenues of employment enhancing the status of petty trading in Calcutta's urban economy and in its limited employment structure. This section therefore examines why there is an absence of a locally based industrial capitalist class and how the growing inertia in the local government since the inter-war period combined in the post-independence period with Calcutta's peculiar brand of political culture, its factionalism, militancy and political patronage to result in the deviations from the urban dynamics observed in other third world cities. This argument is grounded in empirical evidence drawn from an earlier study by the author.²

Section II of this paper takes up the analysis at the sub-sectoral level to show that the needs of the workers of this sector has never been at the heart of the matter. It shows that first, it was the needs of certain

sectors of commercial capital which generated the hostile policies of the Congress government in the early seventies, and subsequently it was the political priorities of the Left Front government which led to its adopting a non-interventionist policy towards the street traders. This section concludes with the socio-economic and political implication of this *laissez-faire* policy.

I

Flight of Industrial Capital, Stagnation and Petty Trading

Calcutta was one of the strongest colonial cities, an enclave of capital accumulation and a centre of investment. However, even in the colonial period there was one major difference with other colonial port cities. Most colonial cities were centres for industrial and commercial capital, like Bombay. Calcutta also attracted foreign and indigenous capital because of its status as the largest metropolis, but the indigenous industrial capital was controlled by groups based outside Calcutta and the eastern region. This was crucial when the national economy reorganised and reorientated itself to the national/internal market.

The political independence and economic reorganisation which helped other centres to strengthen their links assisted in destroying the links and relationships of this regional urban system by deflecting the forces which would have strengthened Calcutta's system. It is argued that such a process is initiated when local capitalists no longer find it attractive (for reasons economic or sentimental) to invest in a particular metropolis either because an alternate site is more lucrative or because the metropolis, unable to cope with the changed situation, became inefficient and inadequate. As the power of the metropolis is undermined, the centre becomes weak and exogenous factors become important. With the basis of earlier domination weakened, internal contradictions of the urban system surface and stagnation sets in and hastens the flight of capital. However, the flow of people into the city tends to continue for a while because disparity³ is still present. In the absence of growth in industrial employment, these people have no alternative but to become self-employed in the commercial sector.

Calcutta's class structure and the socio-demographic composition of the capitalist class has, therefore, been an essential factor in Calcutta's stagnation. Calcutta failed to develop a locally-based industrial capitalist class⁴ which could dominate at the national and regional level. Further, at the state level, because of the economic dominance of non-Bengali groups, an anti-capitalist stance was a common denominator among all Bengali politicians. The interests of industrial capital were rarely represented at the political level in West Bengal.

Bengali capital rarely dominated Calcutta's urban economy. In the colonial period, foreign industrial and commercial capital was predominant, with ethnic capital

from western India playing an increasingly dynamic role, first in commerce and then in industry. Bengali wealth generated during this period was spent on conspicuous consumption, commerce and real estate. The source of this wealth was in the political, structural and administrative changes initiated in the late 18th century. The first of these changes was a reorganisation of the land tax system and the imposition of the zamindari system.⁵ The net result of these changes were far-reaching. Most cultivators, whether formally landless or not, were reduced to near subsistence, as the social safeguard against proletarianisation⁶ was discarded in the search for higher revenue. On the other hand, moneylenders and landlords strengthened their position as they monopolised commercial agriculture, which expanded without an increase in productivity or increase in reward to labour. The intensification of rural poverty as a "large number returned to the land", following the introduction of manufactured goods and subsequent deindustrialisation, had a depressing effect on the level of the wages. "Normally the demand for labour increases with accumulation, the workers being recruited from pre-capitalist societies in decomposition. There is a certain equilibrium between the growth in the supply of labour and the growth in the demand for it" [Amin, 1974: 156]. In Bengal where no accumulation of industrial capital took place alongside the decomposition process, the disequilibrium between the supply of and the demand for labour worsened. Though some of the relations of pre-capitalist mode of production were destroyed, the dominant class survived intact, and the old mode of production retained so that a very dense rural population could be supported. The landowners/zamindars became wealthier as they turned to commercial production and moved to live in Calcutta as absentee landlords. As the value of land increased the position of the ground rent strengthened. Indigenous capital finding its entry into industry blocked, was transferred to the urban centres, primarily Calcutta in the eastern region, into financing commercial activities, conspicuous consumption and real estate.

Within Calcutta itself the dominant local business group was being replaced by trading communities, first from UP (Khatri) and subsequently by Marwaris (from Marwar, a region in Rajasthan). Trading in Bengal had been dominated by a few Bengali merchant houses till the early 19th century. They were gradually edged out of their dominant position by the Khatri.

The movement of ethnic capital to Calcutta, the new enclave of accumulation, can be attributed to the weakening of Moghul empire and the greater insecurity associated with political instability. They gradually took over the wholesaling and indigenous banking activities. Both the Bengali merchant and Khatri invested heavily in urban and rural real estate. This was because indigenous capital was restricted

from entering manufacturing activities by government licensing policy, and those open to entry were not lucrative. As Bagchi notes, "it is simply that under the policy of free trade and with an economic environment where mass poverty was endemic, it was not profitable to invest in domestic industry for supplying the home market" [1982:91].

The effect of investment in real estate was to push up the price of land. The means of getting a quick return to this investment was constructing slum-like dwellings to let out, and secondly, to "farm the land by small shopkeepers". The migrant trading group preferred to 'people' their market by members from their own community and district. Thus the trade in indigenous commodities came to be dominated by Khatri. However, the Khatri were displaced by the Marwaris at the top, although they continued to control the trade at a lower level.

Marwaris gained control of the trade in jute, oilseeds, and in indigenous banking. While the other groups had invested in real estate, this group operating from obscure lodgings, retained a strong "hold on inter-regional money circulation and the flow of imported cloth and spices. Such a long distance interlocking network provided a cushioning system in an overall situation of highly constricted supply of capital, to which the Bengalis never seriously addressed themselves except in a local setting" [Sinha, 1978: 59]. Calcutta had acquired a powerful trading community with its roots, hence its loyalties, outside the region. That is Calcutta had failed to develop a locally-based capitalist class, and this was to have a far-reaching effect in the post-independent period. By 1850s an Indian capitalist class had emerged in western India, which had started to build up a cotton textile industry to supply yarn to local weavers and export to China.

Calcutta and Bombay gained substantially from industrialisation, following the first phase of import substitution starting 1914. But a major difference between the two cities was that most industries in Calcutta had been financed by British and Marwari capital, while in Bombay it was controlled by the locally-based capitalist class. However, despite the loss of its political status to New Delhi in 1912, Calcutta was expanding its production base. But there were signs of inertia in civic administration. Ashraf [1960: 3] notes that "there is little evidence of any appreciable improvement in the city's administration since before World War II". The year 1943 brought the first influx of refugees after the famine of Bengal. The period between the beginning of the 20th century and 1947 saw rapid industrialisation, the beginning of inertia in the city government and the start of an influx of refugees.

In the post-independence period, it is this absence of a Bengali industrial capitalist class which was to be crucial for Calcutta's economy. Industrial capital started moving out of Calcutta soon after independence as mobility of capital and the scope for investment improved. This altered and reduced

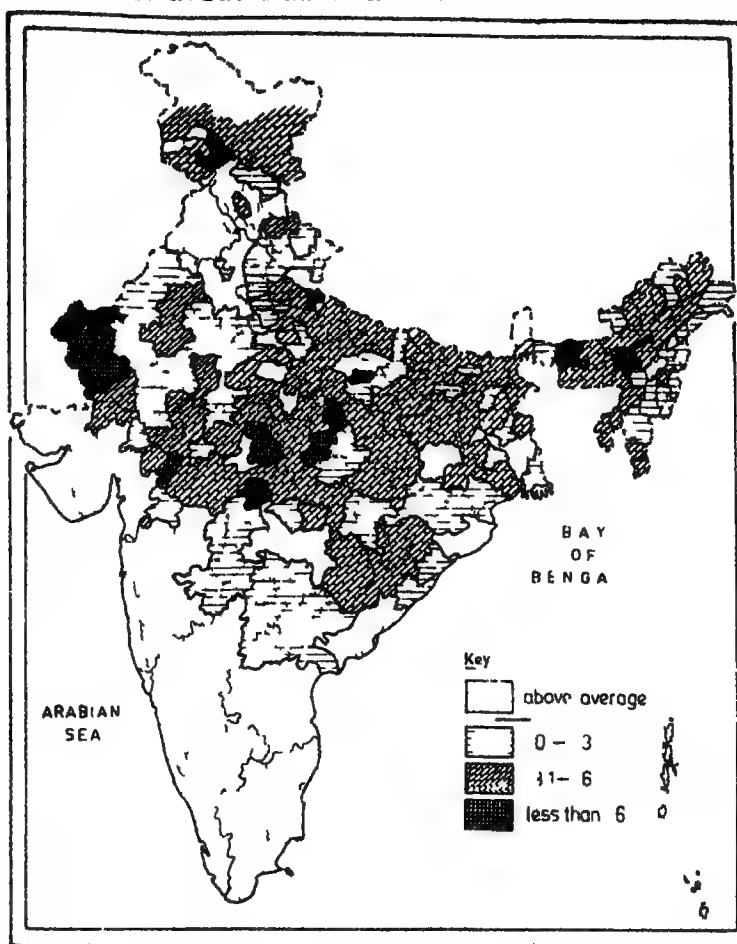

Calcutta's position in the national urban and power hierarchy and hence its ability to influence decision-making at the national level. The Indian capitalist class had subordinated short-term interests to long-term class interests and had played an active role in the national movement. This enabled them to participate actively in the policy planning after independence. Hence this role has been vital to the pattern of economic reorganisation and capital movement that followed. Secondly, along with industrial and commercial capital, industrial employment and commercial enterprise was also dominated by various ethnic groups. The Bengali reaction to this economic incapacity can be observed primarily at the political level. All attempts by non-Bengali politicians, representing economic interests, to enter politics were frustrated. The interests of capital in West Bengal were never represented at the political level. As a result when the cost of reproducing capital increased due to growing inefficiency and political unrest, it could do little to reverse the trend. This merely hastened the flight of capital. The political impotence imposed on industrial capital combined with political and economic changes at the national level, and the influx of refugees, factionalism, economic opportunism and Calcutta's peculiar brand of political culture at the local level resulted in the present stagnation.

In the Indian public economy capital from various segments and regions "fight and bargain for their share in the spoils of the system" [Bardhan, 1988]. The direction of events in the post-independence period in West Bengal and Calcutta indicate that the flight of capital deprived the state substantially of this bargaining power at the national level.

The capital flow into Calcutta dried up soon after independence even though it showed the highest per capita savings and at that time had an adequate infrastructure for industry. Calcutta was no longer attractive once indigenous capital was free to move within the country. Perhaps the presence of a group of locally-based industrialists might have changed the trend. Of course it can be argued that not all states in India have their own group of industrialists. Most states and metropolitan authorities have made it worth while for new capital to move into their states by offering incentives, subsidies and most important efficient management. The point being stressed is the fact that capital moved out of Calcutta even before these incentives were being offered by other states and cities.

Beneath the veneer of administrative efficiency and political stability of the first decade, West Bengal's and Calcutta's economy had begun to slide. Though this was not immediately apparent, it was soon reflected in the statistics. Mitra [1963] and Bose [1965] noted that the city was growing too slowly. While Calcutta was "stricken with an oppressive constriction. Bombay was planning to accommodate the accelera-

MAP VARIATION IN STANDARD OF LIVING FOR REGIONS BELOW AVERAGE

Source: Dasgupta N (1985), 'Geography of Socio-Economic Well Being in India', MPhil dissertation, University of Bombay.

ting in-migration rate" [Mitra, 1960: 31]. The first signs of disinvestment in Calcutta were reflected in factory employment and in the revenue generated. Between 1951-60 regional factory employment in Maharashtra and Gujarat increased by 45 per cent and 13 per cent respectively, while in West Bengal it increased by less than 5 per cent. While West Bengal's revenue declined from Rs 541 m to Rs 496 m, Maharashtra increased its revenue during the same period from Rs 510 m to Rs 526 m [Mitra, 1963].

For the capital which remained, it was unable to influence the state apparatus to act in its interest. The Bengali reaction to the economic incapacity was to impose a political impotency on this group, so that the interests of this group was never represented at the political level. Weiner [1962: 101-102] in a discussion of Politics of Scarcity observed that "in West Bengal, the intellectuals have noted that while the state is populated predominantly by Bengalis, economic power is in the hands of non-Bengalis: factory workers from Bihar, UP and Orissa and Marwari industrialists and commercial entrepreneurs. Even many of the shops, buses and taxicabs as well as the important rice trade are in the hands of non-Bengalis."

The Bengali reaction to this economic in-

capacity is observed primarily at the political level. In the post-independence period, all political factions in the Congress successfully obstructed every attempt by non-Bengali industrialists and other hopeful politicians to enter into state politics. The state assembly, state government, bureaucracy and political leadership are all dominated by Bengalis. In fact "non-Bengali groups are not represented within the governmental framework in spite of their substantial number" [Weiner, 1962: 102]. The first attempt to involve industrialists in state politics was made by B C Roy. However, the strong opposition from within the party forced him to abandon his plans [Sengupta, 1988]. Further, the non-Bengalis were also prevented from participating in urban management. As Mitra [1963] noted, Bengalis of all classes, social backgrounds and professions were represented in the governing body of the corporation of Calcutta, but there were no representatives of the business community. According to Mitra, the economic needs and interest of the urban economy were never quite represented at the policy level. This struggle to keep the industrial capitalist class from influencing state politics could be said to be an expression of the constant class struggle. Bombay presented quite a contrast

where policies and management strategies of the Bombay Municipal Corporation were designed to meet the needs of the industrial and commercial capital. Mitra notes that Bombay in the sixties was efficiently managed because the business community was involved, "Bombay was their passion".

In the state derivation debate on state and capital, three positions can be identified on the content, form, function and limits of the state apparatus to act in the interest of capital in general. According to the first position [Mueller and Neuss, 1975] the automatised state stands above the fray. The social relations of an otherwise anarchic society are reproduced and the general interest of the total social capital is thus established. In a review of the second position, Holloway and Picciotto [1978: 23] note that, according to Flatow and Huisken, an autonomous state is necessary because "relations of competitions existing between different classes of property owners make it impossible for them to realise their common interests other than through the state". Hirsch, occupying the third position, states that within capitalism the appropriation of surplus requires the relations of force to be abstracted from the relations of production and located at an instance standing apart from the direct producers. Thus the state is a historically conditioned form of relations of exploitation.

Though these three positions differ in their analysis of the form and content of the state, common to all is the underlying theme that the function of the state relates directly and/or indirectly to the interests of capital. It is because industrial capital was unable to influence the newly emerging political system in West Bengal, in the post-independence period, that it was unable to check the growing inefficiency and mismanagement of the urban economy and the deteriorating infrastructure and which ultimately increased the cost of reproducing capital. It was the growing inefficiency and the political instability which substantially increased the cost of reproduction of capital and hastened the flight of industrial capital which had begun soon after 1947.

The post-independence industrial expansion was naturally accompanied by industrial diversification and modernisation. In Calcutta, without any mentionable investment and sluggish growth, there was no question of modernisation and diversification of industry. That is, Calcutta failed to keep up with the pace and direction of economic change in the rest of India. The loss of locational advantage with price equalisation also affected Bihar, which was already one of the poorest and most backward states of the country. That is, Calcutta and the eastern states were thrown into a crisis from which they still have to emerge. However, a recent exception is Orissa, which after some aggressive marketing, now has the highest per capita investment in the country (CMIE). These two factors together largely determined

Calcutta and West Bengal's capacity to bargain and influence policies and events at the national level.

Calcutta, as it unsuccessfully grappled with its internal problems failed to participate in the process of change and gradually slipped down in the national hierarchy of power. Hymer [1975] states that the importance of a region/place depends on its position in the "hierarchical system of authority and control". The relationship between the different centres is one of superior and subordinate with the decision-making occupations being centralised in a few key cities. The structure of income and consumption will parallel the structure of authority and status. The process produced and established a different centre-periphery spatial structure in which Calcutta was relegated to the periphery. The new politico-economic structure which emerged was influenced by the rapidly growing and increasingly powerful group based in the west who also actively participated in urban management.

The new division of labour at the national level led to increasing polarisation of capital, skill and productivity primarily in Bombay and Delhi and several other secondary centres in the west and north. These gaps, once created, have been widened by state intervention in the form of price equalisation of all basic industrial raw materials and by the expansion of the multinationals and the rest of the private sector founded upon this inter-regional division of labour itself based upon the fundamental centre-periphery polarisation of the economy. Secondly, accentuating and sustaining this pattern today are the market forces working against the eastern states. Being economically the most backward, with a generally low level of wellbeing (see the Map) and small purchasing power, attracts fewer consumer goods industries. Mohan [1989] in an analysis of manufacturing and urban employment between 1961-81 notes that "among the traditionally industrialised states the fall in the share of manufacturing employment and urban population is the highest for West Bengal". Further, "West Bengal suffers a drastic fall in the share of manufacturing value added from 18 per cent in 1961 to 13 per cent in 1971 and to just under 10 per cent in 1981" [1989:2495]. The period between 1961 and 1981 saw a regional dispersal of industry and doubling of industrial employment. In 1961 Maharashtra and West Bengal each employed a fifth of the industrial workforce. In 1981 Maharashtra still supported 17 per cent of the workforce but West Bengal's share had declined to less than 14 per cent. Basu [1988] and Robertson [1987] indicate that because of a decline in industrial production in West Bengal there has been a fall in the level of living.

While it is the composition of the capitalist class which is largely responsible for initiating a stagnation it is the deteriorating relations between industrial capital and the state which is responsible for its

persistence. The disinvestment, the declining standard of living and the persistent high rates of unemployment in Calcutta's labour market has shaped the way the petty trading sector has evolved.

Empirical evidence suggests that petty trading has absorbed workers from all segments of Calcutta's labour market which has a complex socio-ethnic composition. The city has a long history of migration from neighbouring states, with different groups dominating certain industries (R Dasgupta, 1981) in the manufacturing sector and certain occupations in the tertiary sector. A greater complexity has been added by the periodic influx of refugees belonging to the middle class and more educated than the local population [Sen, 1960]. Also jostling for employment are the urban residents and migrants from the surrounding districts. It is estimated that there are nearly 100,000 street traders operating in Calcutta today.⁷ The number of street traders in Calcutta increased by 186 per cent between 1962 and 1972, a period marked by growing urban unemployment. As it absorbed a growing number of workers, street trading spread to every part of the city irrespective of the functional land use of the area and developed complex links and relations. However, a discussion of these links and relations is beyond the scope of this paper.

Evidence also suggests that though petty trading has attracted workers from all these groups it is more important to the city-born workers, some of whom are educated. Whereas the trends in the rate of entry of workers of all socio-ethnic groups is declining, it is rising for the city-born workers. The differential trends imply that there is a group of workers whose employment options are being gradually limited. To appreciate the significance of the differential trends in the rate of entry of the different socio-demographic groups into petty trading, a brief description of these groups is necessary.

The two major groups were the Bengali traders and non-Bengali migrant traders.

Bengali Traders (56 per cent): The refugees from Bangladesh (20 per cent) are Bengali Hindus who moved with the intention of taking up permanent residence in Calcutta because of religious persecution. Most of the refugees belonged to the middle class group, the Bengali *bhadralok*. They were totally uprooted and forced to sever all links with their country. They intended to merge into the mainstream of life in Calcutta and after 40 years their assimilation is almost complete.

The second group (18 per cent) of Bengali traders are those who have come from the surrounding districts of Calcutta, while some are from the other districts of the state. Most of these intra-state migrants live in Calcutta with their family. A third group (18 per cent) of Bengali traders are those born in the city, some of whom are educated. This group also includes the children of the refugees born in Calcutta.

Non-Bengali migrant traders (44 per cent): The non-Bengali migrants form a varied and complex group but they have one common purpose. The migrants from Bihar (28 per cent), UP (8 per cent), Orissa (5 per cent), Rajasthan, MP, Punjab and others do not come with the intention of taking up per-

manent residence (this does not include the Khatri and Marwaris who form the bulk of the wholesalers and large retailers) For them the city is just an economic space which provides an opportunity for better living in their village. They send back a major proportion of their income to their village and they themselves return to the village at the end of their work cycle, while their job or business is taken over by the son, relative or someone from the same village or district. They have no desire to assimilate and live in ghetto like units, nor any intention of improving their standard of living in the city. It has been estimated that Rs 1,500 million goes out of Calcutta through small postal orders to the neighbouring states every year [Misra, 1987]. Only one tenth of that comes back to the state. Interviews with migrant street traders showed that all migrants send back about 50 per cent of their earnings which ranged from Rs 150 to Rs 600 every month.

A break up of petty traders according to their place of origin and level of education

is also necessary to understand the relations among the various groups being drawn into this sector. Starting with the highest level of education, it is noted that nearly 6 per cent of the petty traders are graduates. A look into their background shows that they are all city-born and from the middle class. In 46 per cent of the cases the father ran a family business or was involved in trading, 25 per cent had regular employment in clerical occupations and another 10 per cent were professionals like doctors, teachers, legal assistants and brokers. They were all city-born but 50 per cent were second generation migrants from Bangladesh. However, 8 per cent of the traders had a rural background. They were all migrants from Bihar and UP.

In India a student is supported through his college by his family as little or no outside financial help is available. This implies that whatever may have been the profession or occupation, the family income was enough to support the trader through his education. This would place these families in the middle income group. Thus we have a group educated, city-born, but not skilled in any particular activity, moving into petty trading. The presence of this group, however small it may be now, indicates a process in which a section of the resident middle class is sliding back into a low income, low productivity sector. The process reflects the effect of a stagnating core on the resident population. The average age of these traders at the time of the survey was 34. On an average they had joined trading twelve years ago, that is they were approximately 22 to 23 in 1973-74. In other words, their time of entry coincided with the period of highest unemployment (Appendix Table A).

Looking first at the trends and rate of entry into petty trading it is clear from the Figure that each group has a different pattern and rate of entry into petty trading. The total entry into the sector appears to be slowing down, after having peaked 15 years ago. It also shows that all groups follow the general pattern except the group of workers who are city born.

Given these trends it would appear that in the face of industrial stagnation in the State, flight of capital, skill and business and political instability a large number of new urban entrants to the labour market in the mid 1970s had little choice but to take to petty trading. While 41 per cent had no other alternative but to take up trading, nearly 26 per cent felt it was the easier way out of the quagmire and 17 per cent said since all other avenues were closed and they happened to know someone in trading, it was the best bet. Approximately 13 per cent felt it was a combination of some of these and other personal reasons which pushed them into petty trading.

These varying trends seem to suggest an increasing pressure on the resident urban workers and raises questions like why are fewer migrants entering the sector? Is their share in other sectors also declining? To

FIGURE RATE OF ENTRY OF DIFFERENT DEMOGRAPHIC GROUPS INTO PETTY TRADING

answer these questions it is necessary to compare the trends and the pattern of entry into other sectors by the different groups.

An inspection of trends in employment of the various demographic groups in the different sectors of the urban economy suggests changing movements within the labour market. The non-Bengali migrant groups in industrial employment have maintained their ratios in industries where they control the union, in spite of rising unemployment among local youths. Though their proportion in most other categories of activity is declining, it has increased from 13 per cent to 24 per cent between 1984 to 1986 in 'engineering and contractor firm' [*Labour in West Bengal 1986*]. The migrant groups from Bihar and UP continue to maintain a stronghold on transportation and portage, activities closely connected to trading.

When these findings are examined in the context of decreasing urban migration of the total urban setting, and dynamics it appears to suggest that three separate parallel movements are taking place: (1) that new migrants were moving to other small scale activities; (2) that they were moving to other sectors of large scale activities, namely construction; (3) that a greater proportion of the smaller number of migrants goes directly to manufacturing industry and other large scale activities where they constitute a powerful body in the trade unions.

These movements support the notion that petty trading is of growing importance to the illiterate and educated unemployed youth of the city. With the lack of alternative employment opportunities the group will continue to join petty trading whether the state adopts a positive policy or not. The presence of this group in petty trading is indicative of the class realignment taking place in Calcutta. Unable to even reproduce their conditions they are attempting to enter the urban

economy at a lower level so as to be able to have access to at least the basic factors of well-being.

However, though the rate of in-migration has been declining, this does not discount the possibility that some migrants might still join the sector. The probability of labour moving to other small scale activities requiring little capital is high. Unfortunately it is difficult to assess labour movement among such activities. Secondly, very little information is available about the changing size of such activities. Though difficult to document, the growing size of the sector would seem to suggest it. The likelihood of non-Bengali migrants moving directly to large scale manufacturing and construction has already been suggested.

The generally declining rate of in-migration and the continued dominance of certain activities in the urban economy clearly suggest that a bulk of the smaller number of migrants have direct access to employment in large scale production and exchange activities. Research has already established that once a stream is initiated it is difficult to divert, because new migrants will only go to a place where they have a relative friend or someone from the village. They come forward to help workers to get over the high initial cost of moving into urban areas. According to Aziz [1984] it is this socio-economic mechanism which appears to have replaced the high wage differential that was theoretically believed to have attracted migrants.

Presence of this mechanism explains why Calcutta continues to attract, though a declining proportion, migrants despite a stagnating urban economy, increasing unemployment and falling productivity. Secondly, the control of labour recruitment in many sectors of the urban economy by the non-Bengali migrant groups and the

socio-economic mechanism would make it possible for migrants to move into the large-scale, modern sector, by-passing a stage thought to be essential [Cherunilum, 1984]. This very mechanism is at the core of the migrant's success in obtaining employment or in establishing himself as self-employed in the city.

It is the same mechanism which will help a migrant join petty trading. These socio-ethnic links are a definite source of advantage to the migrant and each social group and sub-group continuously reinforces the mechanism by drawing workers only from their own group. It introduces the migrant to the wholesaler and/or the financial middleman. On the other hand it helps the wholesaler and/or the middleman to draw his new recruits from the pool of new migrants.

Interviews with the Bengali traders revealed that they had few such contacts and depended on their own initiative and relied on their market information and familiarity with the commodity they decided to trade.

This disadvantaged position of the Bengali petty traders is also reflected in their economic position. An analysis⁸ of the monthly per capita consumption expenditure of petty traders of different demographic groups revealed that the process of consolidation for the Bengali traders was longer and slower than for the migrant traders who could more easily establish their economic links with the 'mahajan' on the basis of their common religious/caste/ethnic/regional links. The distribution of monthly per capita consumption expenditure for the different demographic groups also showed that migrant traders were better off than the Bengali traders for their income tends to stabilise at a lower level for a longer period. In the absence of common socio-ethnic links with the 'mahajan', the Bengali traders have to very gradually build up their credibility for higher credit. Their position is further weakened by the illegal status of the sector. Further, with the higher household budgets of urban living and the desire to maintain a certain standard of living, the educated Bengali traders find it extremely difficult to balance their household needs and business demands, leaving them exposed and vulnerable. However, a majority of these traders are located in the middle to high income residential areas, dealing in a wide range of commodities with scope for income gains to filter down. The second group of highly vulnerable Bengali traders are those operating in the low income areas, whose scope for increasing their income is extremely limited. They generally run tea and/or cooked food stalls, or commute with fresh vegetables from the outskirts of the city. Most of these traders have little or no education, skill or capital.

This sector has not only become an important source of livelihood within the limited structure of urban employment in Calcutta, it is the most important source of employment to its most vulnerable workers.

The Bengali street traders emerge more exposed and vulnerable than most others. The growing proportion of city-born petty traders reflects the increasing pressure on the residents. The state's disregard and neglect for the vast number of workers can be attributed to two sets of factors, political priorities and political exigencies. The political priorities are tied to the nature of the support base on which the Left Front depends. The predominantly rural base of the Left Front gave its policies a non-urban focus, while the political exigencies stemmed from the policies of the previous government. The non interventionist policy of the present (Left Front) government towards petty traders was a response to the negatively interventionist policy of the previous (Congress) government. The fact is that neither policy shows an understanding of the significance of this sector.

II

Politics of Petty Trading

The sequence of events since the early 1970s shows that state attitudes and policies towards petty trading had little to do with the state's perception of the petty traders' problem or the importance of the sector. The politics of petty trading show how certain sections of commercial capital worked through the state administration to influence policy at the sub sectoral level to limit spread and growth of petty trading.

As this sector continued to grow at a faster rate than any other sector in the 1970s, the Congress government then in power was forced to take a stand on the issue of 'hawkers' in Calcutta as the state prefers to call them. The number of street traders had increased very substantially by 1972. The state government and the municipal authorities initially attempted to evict the street traders but met with considerable opposition, particularly from those petty traders who had come as refugees from Bangladesh and from the members of the Bengali middle class. The plan was abandoned.

By 1975 the authorities believed that Calcutta was getting too congested with 'hawkers'. The need to define a stand and outline a policy did not stem from a concern for this burgeoning group of low income workers. Petty traders the unauthorised occupiers of public space were regarded as a growing nuisance to pedestrian and vehicular traffic and were considered visually unattractive. The policy which emerged reflected this attitude and the total lack of comprehension and/or recognition of the socio economic processes affecting the urban economy.

Samaddhar (1978: 50), the administrator corporation of Calcutta during the first half of the seventies when the Congress was in power, notes that 'Operation Hawkers' in 1975 was "first thrashed out between ministers of municipal services and C MDA and it was agreed that those people had come to the footpaths not at our bidding but

as they pleased, depending on some other methods of arrangement (invisible as I mentioned) and we were therefore not obliged to make alternative arrangements far less full-fledged rehabilitation". Backed by Section 354 of the Municipal Act of 1951 the authorities undertook the operation with 'great enthusiasm'. It was one of those rare instances when the state and the municipal authorities stirred themselves out of their apathy, to carry out these eviction drives. The "well planned drives to clear roads and footpaths" were 'successful' in areas around the central business district, along Brabourne road skirting the wholesaling area of Barabazar and in and around Esplanade. It is important to note the stalls located along the many lanes inside Barabazar were left undisturbed. The petty traders along these lanes had been located there so that the 'mahajan' could keep an eye on them. Further, the areas cleared of street traders were in the major retailing areas and markets where the street traders had blocked the shop frontage. The cluster of petty traders in and around all hospital complexes creating extremely unhygienic conditions (most petty traders here sell perishable, cooked food and snacks) were however left undisturbed. The "two hard areas of Sealdah and Shyambazar-Baghabazar were left alone". These areas dominated by Bengali traders had been most vocal in their protest in 1972, and had spearheaded the opposition to the government drive to evict them. They had by 1975 organised themselves into unions affiliated to the CPI(M) and the Forward Bloc. These areas were to be tackled in the second phase of the operation.

The pattern of the so called road clearance and hawker eviction scheme seems to suggest that Operation Hawkers had more to do with the interests of the commercial sector, who had little to gain from the presence of the petty traders, than a concern for the city.

Operation Hawkers was quickly abandoned as a wave of protest, backed by social welfare organisations and political parties, swept through the city. Political parties and trade unions reorganised and regrouped the evicted traders and helped them to re-establish their stalls. Demonstrations and processions were organised by the various area and product unions forcing the government to stop the eviction. The greater politicisation of this sector following Operation Hawkers had two effects. It gave the sector a greater cohesion as unions cut across socio ethnic lines, but secondly, it brought the petty traders under greater political control.

As the protests and demonstrations died down Samaddhar came up with another poorly conceived plan. He suggested constructing meenabazars to relocate some of the street traders. However, these 'meenabazars' were to be constructed only after the traders had been evicted. Expectedly, the plan provoked a lot of protests. The loudest

protest came from the women's groups who regarded the term as pejorative and totally unsuitable, with its implications of feudal pomp (Meenabazars were fairs held for the Mughal Emperor, where the women decked in their finery would try and entice the emperor to buy their products). However, more important was the protest from the established retailers of the areas where the meenabazars were to be constructed. Wine shop, boutiques, restaurant owners and all large retailers brought a high court injunction against such a construction.

This sequence of events suggests that the state government has never quite been involved with the problems of these low-income workers. Its policy had more to do with keeping certain sections of the commercial sector happy, than a concern for the city's congestion. However, this same group would turn to law to prevent the state and municipal authorities from implementing any plan which would affect them adversely. It is ironical that while the stronger industrial capital failed to influence politics in the state and its policies, commercial groups had the state government looking after their interests. Weiner (1962) in a discussion of the effects of the business community on the politics of West Bengal noted that these businessmen were exceedingly influential at the administrative level.

In 1977, the Left Front came to power in West Bengal. As far as their political stand on petty traders was concerned, it was necessary for them to demonstrate that they sided with the petty trader, the man on the street, as against the Congress who had represented the big commercial interests of Calcutta. Their stand against capital is a part of their broader ideological stand which brought them to power. Also, most of the political parties in the Left Front government were actively involved with the petty traders through the unions. Thus the *laissez faire* policy adopted with regards to the petty traders was politically exigent, and reflected neither a greater concern for its workers nor an understanding of the socio economic processes. In fact the government refused to address the problem of the petty traders and the problems of the urban poor as a whole with any comprehensive plan.

The last few years, however, indicate a change in attitude and a shift in policy relating to the manufacturing sector. The government has accepted that the state and the urban economy cannot develop without industrial capital. Though this change in policy is not a sudden volte face it does mark a possible change in the relations between industrial capital and the state of West Bengal. Ever since the CPI(M) has been in power its political philosophy has been gradually diluted. This is reflected in its efforts to develop the infrastructure for decentralised planning in rural West Bengal. Ghosh notes that "though centralism is inherent in a communist framework, the West Bengal government has made more attempts at decentralised planning than any other

state" [Ghosh, 1988: 655] (except perhaps Karnataka) and has been successful in raising agricultural productivity and increasing grassroots participation in rural planning. Though the state government has adopted a more pragmatic approach to the state's other problems, it appears unaware of the significance of the rapid increase in small scale non manufacturing urban activities, particularly retailing. These activities are a manifestation of the two decades of industrial stagnation and the associated socio-economic changes which have taken place

CONCLUSIONS AND IMPLICATIONS

The system of activities in an urban centre depends on the role and position of that urban centre in the hierarchy of the national urban system and the power structure. The hierarchised interdependent system of urban activities found in a city therefore depends on the position and role of the urban centre. Changes in such a structure affects the role and significance of most activities in the system. In Calcutta the flight of industrial capital accompanied by a loss of bargaining power at the national level, the steadily deteriorating relations between the state and capital at the regional level ensured continuing stagnation in production, a decline in standards of living and a substantial increase of small scale activities. Among the small scale activities street trading has been one of importance to almost all groups in the labour market. However evidence suggests that it is of particular significance to the growing proportion of the city born Bengali workers, while there is a slowing down of total entry into the sector. These trends suggest the possibility of a gradual change in the demographic composition of the sector. These findings negate the popular argument often put forward by the state that, given the large migrant component, any gains made through state interventions would leave the urban economy. However, it might be argued that there has occurred a gradual change in the relations between the state and industrial capital as the state government realised that stagnation will persist without industrial capital. A movement of capital into West

Bengal would imply that with increase in industrial employment the significance of small scale activities would decline. Though the present interest of industrial capital in West Bengal is exciting, little is said about the employment it will generate. Further, given that most of the investment is into highly capital intensive petrochemical industries, it could hardly be expected to even dent the unemployment situation. Even if there is a massive injection of capital into the state economy, it will be quite a while before it reduces the pressure on the labour market. Secondly, a large number of the workers in petty trading will be 'professionally stranded' [McCee, 1973] and unable to utilise the opportunities for alternative employment.

The need for a positive intervention by the state, where its policy is shaped by the needs of the workers and not by state capital relations is further heightened by the disadvantaged position occupied by the street traders. Being designated as illegal workers allows for a greater control by the 'mahajan' of the production relations and hence highly exploitative relations. Also as a result of their illegal status the police continue to extort protection money, with the amount varying with the kind of product sold and depending on how established the petty trader is. Further, the initial hostile attitude towards this sector has led to a rapid politicisation of this sector in the 1970s and a continued dependence on the various political parties subsequently. This of course raises doubts about the willingness of these parties to legalise the sector. Hence, there is today an added factor working against legalising this sector besides those segments of commercial capital which always opposed any help towards this sector. The longer the state avoids the issue of devising a comprehensive plan to help the urban poor (of whom the petty traders form a substantial component) the more complex will be the process of planning and implementation.

The case of Calcutta shows that the kind of capital which dominates and the state capital relations determine the path of change not only for capitalist production but also the nature and form of petty commodity

activities articulated to the dominant mode. Further, it shows that within the urban economy, the role of the state and its relations with different types of capital are fundamental to shaping the activities of the petty commodity sector. The needs of the sector have not been at the heart of the matter at the policy level. The methodological implications of this conclusion is that a study of petty commodity activities needs to look at the relations between different sections of capital, for the role that the state plays in influencing petty commodity sector is conditioned by these relations.

Notes

[This study was partly funded by the Central Research Fund, University of London.]

- 1 The petty traders in Calcutta are generally referred to by the corporation of Calcutta and by the state government as hawkers though they are neither itinerant nor mobile.
- 2 The empirical evidence provided in this study is based on the field work carried out in Calcutta between March 1987 and July 1987, as a part of the PhD programme, University of London. 1,344 petty traders were interviewed, beside union leaders of the different areas and of different political affiliations. A second round of survey was conducted after the empirical analysis was completed to obtain the opinion and reactions of the petty traders themselves to the survey results, but more importantly of the politicians, of planners from the CMDA and of the administrators from the corporation of Calcutta.
- 3 Declining small towns and very slow improvements in agricultural productivity make it difficult to narrow the disparity already established.
- 4 Calcutta's economy precariously balanced the interest of landlords, capitalists, professional class and upper class. Sen [1972] described the colonial city as a city of 'nouveau riche' i.e. of imperial administrators and commerce of absentee landlords, moneylenders and real estate speculators.
- 5 The social impact of the Permanent Settlement Act cannot be underestimated. The landed class, had started to consolidate its position with the weakening of the Mughals. This legislation in Bengal quickened the process and allowed the zamindars (large landowners) and the 'bhadralok' (rural gentry) to consolidate and to reside in Calcutta. It is the continued presence of this group which shaped Calcutta's peculiar political culture [A Banerjee, 1987: Section 3.4].
- 6 Under the Mughals the tax was levied on the output and could be paid partly in kind. The new tax was levied on the land, the peasant was entitled to cultivate and had to be paid in cash. This forced the peasant to cultivate marginal and pasture land and made him more dependent on the market.
- 7 This estimate is based on an analysis of the 1981 unpublished employment statistics obtained through A Chakravarty. The officers of the bustee cell, corporation of Calcutta, agreed with the estimates made by this study.
- 8 For a detailed discussion of the economic status of the petty traders and their survival strategies, see Dasgupta [1990].

APPENDIX TABLE A: RATE OF INCREASE OF EDUCATED UNEMPLOYED IN WEST BENGAL

| Year | 1968 | Increase | Rate of Increase (Per Cent) |
|------|---------|----------|-----------------------------|
| 1967 | 152,589 | 5,490 | + 3.4 |
| 1968 | 158,079 | 67,972 | + 43.0 |
| 1970 | 226,051 | 144,496 | + 63.92 |
| 1971 | 370,547 | 277,927 | + 75 |
| 1972 | 648,474 | 86,220 | + 13.30 |
| 1973 | 767,442 | 32,748 | + 4.25 |
| 1974 | 833,028 | 65,586 | + 8.5 |

The Retarded Economies

Foreign Domination and Class Relations in India and Other Emerging Nations

by Nirmal Kumar Chandra

Why is it that while the former colonies and semi colonies have emerged as a major force in world politics over the last four decades, their economies in most cases remain retarded? The first part of this volume focuses on the exchanges between the poor and the rich nations. Did western aid, private capital and technology really help India, or was it the other way round? Granting that both sides made some gains, did the USSR derive undue advantage through its bilateral trade and aid transactions with the third world? Can the theory of unequal exchange explain the growing economic hiatus between the north and the south? The second part of the book is concerned with the domestic scenario in India. The author tries to relate the overall stagnation in material production per capita to the balance of class forces that emerged after independence as a result of a strategy of industrialisation based on import substitution. Long term trends in aggregate and sectoral outputs, the terms of trade between industry and agriculture, real wages and unemployment rates, savings and investment, private monopoly capital etc are analysed in this context. Further, the existing laws and regulations on private sector monopolies are also examined from the same perspective. The final essay is a critique of the recent tilt, inspired by the IMF and the World Bank, towards liberalism in India's economic policies.

Judicial Accountability to the Community

A Democratic Necessity

V R Krishna Iyer

Our founding fathers have laid down for us a constitutional jurisprudence of judicial power, but the integral component of judicial accountability has not been designed with a sense of principled pragmatism. As a result the escalating misconduct of judges has often gone unpunished. Barring the extreme measure of impeachment, the law is silent, so much so that one might well say that the accountability of the judiciary is the vanishing point of jurisprudence. This void, unless competently covered by well thought-out legislation, is bound to undermine the democratic credibility of the judiciary

We all judges and lawyers, must restore our old faith and rekindle new hopes. The future is yours, men and women of law, take it and redeem yourselves.

— Justice Sabyasachi Mukharji

DI MOC RAC Y, as the opening page of our constitution declares, proceeds on the fundamental postulate that ultimately political sovereignty vests in the people of the country. This sovereignty gains social reality and dynamic viability only if the constitutional instrumentality submits tacitly to the broad oversight of the sovereign people. The people in the mass obviously cannot exercise monitoring, controlling, disciplining and like functions. Therefore, we need checks and balances so that power vested anywhere may not go haywire and may become amenable to the constitutional fundamentals and answerable to those who are the ultimate masters or donors of the power. This nexus between power and people has a certain dialectic. There is bound to be a contradiction, over time, between the tendency of authority to turn authoritarian, corrupt or partisan, and this proclivity may be accentuated by the syndrome of popular illiteracy and meek submissiveness of the masses and even of the classes who are overawed by echelons of power. The other side of the contradiction is the inevitable eruption of discontent, protest, violence and other forms of entropy induced by administrative terrorism, unabated disenchantment and infliction of injustice camouflaged as justice. Chaos will sully cosmos if the processes of order are not functionally ensured by law and justice and the structures designed for the delivery of justice. If this confrontation is not to escalate into explosive resistance to court and judge, a new rapport, communication and accountability of judicial power to the beneficiaries, viz, the Indian people, must be fashioned.

The Indian experience with regard to the executive, judicative and legislative instrumentalities over four decades has been one of exploitation darkening into misgiving, misgiving deepening into despair and despair exploding as adventurist violence. The categorical imperative for stability in democracy is, therefore, to see that every instrumentality is functionally kept on course and any deviance or misconduct, abuse or aberration, corruption or delinquency is duly monitored and disciplinary measures taken

promptly to make it unprofitable for the delinquents to depart from the code of conduct and to make it possible for people, social activists, professional leaderships and other duly appointed agencies to enforce punitive therapeutics when robed culprits violate moral legal norms.

Our founding fathers have laid down for us a constitutional jurisprudence of judicial power but in spite of their wisdom the integral component of judicial accountability has not been designed with a sense of principled pragmatism. Of course, it is equally disconcerting that the legislature and the executive have been indulging in corrupt and not so corrupt stultification of their vital functions. However, that is no alibi for judges to misbehave, especially because justice is the foremost human right and the first constitutional promise. Moreover, there is a spreading rash of judicial delinquency in many forms undreamt of in the past, unimaginable even today, and unprovided for by the founding fathers by way of correctional methodology. Luckily, the malady is in the early stages and it is tragic that the disease is apparently showing up in the most unexpected quarters, and today from the highest court down to the floor level there is grievance writ large about forfeiture of confidence in judges for various reasons. The panache of wigs and robes, 'wise saws and modern instances,' 'eyes severe and beard of formal cut,' silver mace and liveried bearers cannot cover up the pathology of lost confidence and exposed culpability. Their lordships in full panoply will still invite contempt unless they become institutionally and individually accountable to the country and be punishable for unbecoming behaviour, dereliction of duty and common criminality. 'Be you ever so high, the law in its equal majesty, is above you too!' The reasons for the decline are several but a most disturbing one of them is the absence of accountability and the frequency of unchecked abuse for anti-social and self-seeking purposes. Office and apparel are no amulets against detection and conviction. If we do not arrest the vice now, the institution may well be heading for collapse.

HANDS OFF DOCTRINE OUTDATED

All public power is a people's trust and so even judicial power has a fiduciary com-

ponent. Trusteeship and accountability go together, and constant monitoring plus social audit of the power process are a watch-dog factor. Executive power is accountable to the parliament and the parliament to the people. Judicial power is not accountable to the executive nor to the parliament in any direct sense. Nevertheless, being a democratic institution, the judicature must be answerable to the people. The oath of office clearly implies this responsibility. The iron curtain of contempt of court will not silence the populace when the time for storming the Bastille arrives. Wisdom and statesmanship lie in improving the system, with dialectical perceptions and dynamic prophylaxis. The cult of the robes must yield to the command of democratic discipline. Jerome Frank elegantly expressed the obsolescence of the hands-off doctrine.

The robe as a symbol is out of date, an anachronistic remnant of ceremonial government. An immature society may need or like to fear its rulers, but a vital and developing America can risk full equality. A judge who is part of a legal system serving present needs should not be clothed in the quaint garment of the distant past. Just as the robe conceals the physical contours of the man, so it needlessly conceals from the public his mental contours. When the human elements in the judging process are covered up, justice operates darklingly. Now that the Supreme Court has declared the judiciary a part of candid democratic government, I think that the cult of the robe should be discarded. (Jerome Frank, *Courts on Trial*, pp 260-261)

A new theory of judicial exposure and accountability is integral to the Republic's moral survival. Says Laski:

Obviously therefore, the men who are to make justice in the courts, the way in which they are to perform their function, the methods by which they are to be chosen, the terms upon which they shall hold power, these, and their related problems, lie at the heart of political philosophy. When we know how a nation state dispenses justice we know with some exactness the moral character to which it can pretend. (Harold J Laski, *A Grammar of Politics*, pp 541-542)

Some fundamentals must be accepted as constitutional basic to our republic. The judiciary derives its power under the constitution, not over it. It follows that constitutional democracy which is the basic struc-

ture of our polity applies equally to the three major instrumentalities. From Abraham Lincoln to Wendell Holmes, on to Jeromes Frank and Harold Laski the proposition has been accepted that the judiciary is a part of our democracy and must, therefore, be subject to the discipline of democracy. Social audit of performance is an obligation inescapable for a democratic instrument. Secondly, disciplining the operators where deviance is distressingly mounting is also a functional imperative which cannot be justified only to defend judicial prestige. Thirdly the judiciary occupies among the trinity the highest place in the people's conscience and confidence. The liquidation of the judiciary, which is a unique and sublime office shall not be allowed even by slow degrees since the entire country is committed to its exalted status. Justice and the instrumentalities of justice are too serious a business for being left to the judges alone. The bench and the bar must be mutually accountable and more than that both must fulfill the people's expectations since these two are the accredited constitutional mechanisms for delivery of justice. If the bench or the bar chooses to indulge in grave vice and when exposed bark and bite it will unwittingly become its own grave-digger! Bhatto before he was executed wrote in the last part of his tragic book, 'there is something in the human history like retributive and it is the rule of historical retributives that the instrument be forged not by the offended but by the offender himself'.

The Indian constitution provides for one extreme punishment namely impeachment. The procedure prescribed by article 124(4) is too restrictive and difficult to comply with. It is like a penal code which provides only for death sentence imposed after an abusive political procedure where acrimonious attacks on judges with no holds barred comes as a rare and delectable opportunity. Moreover it involves a political judgment upon the tenure or termination of a judicial office. More than that, contending parties may take rival positions independently of the merits and foul the air. Even beyond that is the vice of the extremity of the punishment by way of impeachment. Initially there are difficulties in igniting the jurisdiction for taking action. A number of MPs must sign a petition, a reference must be made by the speaker to a small body that body must investigate and give a report which eventually must become the subject of polluted debate. The fall out of this protracted exercise, even if it gets rid of a vicious judge, is likely to make it a remedy far worse than the malady. Iatrogenic justice is harmful to justice and justices.

Less than impeachment the great parchment does not provide a punitive measure. There are misdemeanours and felonious temptations and vices, rudeness, vulgarity and arrogant misdirection of power which may call for milder therapeutics and punishment after due enquiry by impartial

authority. In this area, our constitutional jurisprudence leaves a vacuum. We need an urgent graded measure for systemic correction and suitable mechanism because accusations are no longer exceptions and judges must suffer criticism and complaints against them cannot be condemned or go uninvestigated and, if true, unpunished. Judicial imperialism, impertinence and absurd or irresponsible behaviourism are a menace to the justice process and must, if the turpitude is truly proved, suffer sentence.

CODE OF CONDUCT FOR JUDGES

A code of conduct for judges is the desideratum. High office notwithstanding, hubris, hauteur, highbrow behaviour and other dubious mean conduct or sophistry hardly become the judicial jackets. Communalism, graft and nepotism with 'son stroke' and widely delinquency are becoming matters of adverse public comment and cannot be allowed to undermine the integrity of the ermine.

Appointments of judges, unless carefully screened by the collective wisdom of a panel with versatile experience, may result in distorted selections and the products—the appointees—may turn out to be bad choices. Leaving this process to the chief justices or the first ministers is no assurance that these secret process will eliminate favouritism, political pollution and other unprintable adulterations.

The judge is the symbol of justice itself and therefore we cannot have a dissection of private life and judicial life of the 'brethren' both must become the sublime office. The pleasures and pains of millionaires, the temptations and vices of the higher classes, the aberrations and abuses of persons in power are taboo or forbidden fruit for the judges. Winston Churchill, decades back told the Commons that judges are required to conform to standards of life and conduct far more severe and restricted than that of ordinary people. Indeed, their constitutional obligation to do justice without fear or favour, affection or ill will is a high moral command and exacting demand on their conscience. If 'you are what you wear' you have to keep up a certain manner of conduct which puts you in a category beyond the politicians and the members of the bureaucracy. Judges, like Caesar's wife must be above suspicion. They must be patient, maintain poise, be gentle and impartial and decline to be provoked and never lapse into venal behaviour or class conscious uppishness. They must be truly free from communalism, regionalism, religionism and frequent acquaintance with alcohol and other deleterious contacts. These lapses are slowly creeping into the judicial 'brotherhood' even as factionalism and undignified wooing of ministers and party leaders are observably infecting justices and getting rewarded through appropriate 'elevations'. Unfortunately, the upstart breed and the midget species behave

in violation of requisite rectitudes. On the bench they commit contempt by intemperate tongue, hubris, hauteur, high-brow airs and other sins of sadism which induce them to tease and insult and bring into ridicule the judicial tenancy itself. A code of conduct even on these details of decorum and comportment on dignified behaviour on the bench and the like may be necessary. Habitual violation must invite the displeasure of the law by punishment and reprimand. A bad judge with a wag's tongue or rude mood may do great harm to the institution. A sadist on the bench who wantonly keeps standing in court other responsible persons for Freudist pleasure until the imperial judge's pride is propitiated needs psychopathic treatment and mild punishment if the venal deviance becomes chronic.

Graver violations which in the case of ordinary persons may involve penal consequences must implicate the judges with the same measure of culpability because the law is no respecter of persons. If a judicial personage commits a sex offence, uses violence or resorts to corrupt accumulation of wealth, he cannot use the robes as defence. If he commits misappropriation, accepts undue presents and pleasures from lawyer or litigant or indulges in other penal offences, the law of torts and of crimes must take care of him like in the case of other citizens. We want our judges to rise as high as the high office he fills and so, far from condemnation of misdemeanours and felonies when committed by the members of the judiciary, severe censure must follow. The impression that judges are above the law must be removed lest the highest office in the land tarnish itself. The bench is a hallowed seat and judges must observe a gracious port and presence without making derisive comments and digs at lawyers and litigants who could as well retort and humble the bench in public. Offensive observations, even regarding other judges and judgments, are not uncommon with little minded judges. Comic performance cannot be fobbed off on a submissive bar. David Pannick cites some British instances which may have Indian parallels.

Judicial humour can turn into judicial woe. The eighteenth century Scottish judge, Lord Braxfield was a disgrace to the age. He took pleasure in tauntingly repelling the last despairing claim of a wretched culprit, and sending him to Botany Bay or the gallows with an insulting jest. Robert Louis Stevenson based Lord Hermiston upon Braxfield. In court Hermiston took his ease and jested unbending. In that solemn place with some of the freedom of the tavern, and the rag of man (the defendant) was hunted gallowsward with jeers. Braxfield and his contemporaries have a special place in the annals of judicial misbehaviour. They were cynically indifferent to the proprieties of the bench to an extent which now may well seem incredible. Uncouth in appearance, profane in speech, frequently harsh and contemptuous in the discharge of their judicial functions, addicted to the wildest eccentricities,

and exhibiting at all times a decided penchant for deep potation and the coarse and boisterous jocularity of the tavern. . . they lacked all judicial qualities (David Pannick, *Judges*, Oxford University Press, 1988, p 83)

Some judges do not care to listen or are too loquacious and by frequent interruptions make coherent argument impossible. There are many other ways in which judges can disrupt fair hearing. Performance and discipline are components of judicial decorum.

In India some judges are stated to be notoriously communal, openly biased, foster favourites and have close relatives at the bar which factor leads to many improper practices. There are factions among judges which inflict mortal wounds on justice. I agree with David Pannick in his observation:

The student of the judiciary inevitably concludes that there have been many bad and some appalling judges, with all manner of defects, administering justice over the centuries. Macaulay rightly explained that 'the earlier volumes of the state trials are the most frightful record of baseness and depravity in the world. Our hatred is altogether turned away from the crimes and the criminals, and directed against the law and its ministers. We see villainies as black as ever were imputed to any prisoner at any bar daily committed on the bench and in the jury box' (Ibid, pp 87-88)

Injudicious and judicially obnoxious behaviour bring disgrace to the judicial profession and cannot be tolerated merely on the alibi that he who commits it is a judge. It looks as if in England they get away with it. I may quote again from Pannick:

You will be unable to bring a legal action against the rude or unfair judge. Lord Denning explained in a 1974 Court of Appeal decision that ever since the year 1613, if not before, it has been accepted in our law that no action is maintainable against a judge for anything said or done by him in the exercise of a jurisdiction which belongs to him. The words which he speaks are protected by an absolute privilege. The orders which he gives, and the sentences which he imposes, cannot be made the subject of civil proceedings against him. No matter that the judge was under some gross error or ignorance, or was actuated by envy, hatred and malice, and all uncharitableness, he is not liable to an action. Judges of a superior court are so protected even when acting outside their jurisdiction, so long as it is a good-faith exercise of the office in the belief that the judge has jurisdiction over the matter. Judges of an inferior court are not so immune if they act outside their jurisdiction, or if they act within their jurisdiction maliciously and without reasonable and probable cause. We are a long way from the recent development in judicial liability in the USA. Some American judges have taken out malpractice insurance because of an increase in claims against them based on their court decisions (Ibid, p 95)

The Indian law is more straightforward but people, with colonial genuflection, hardly challenge 'robed' lapses. I am for a judicial Ombudsman or a Judicial Performance

Commission. Although England has no such system, many American states have such mechanisms for receipt of complaints and investigation into the factum and visit adequate consequences if a judge has acted in other than the Code of Ethics. This subject of performance audit and enforcement of discipline cannot be left to lawyers' strikes, internment of judges and chief justices' moods and methods. Bombay and Delhi have brought home the frequency of horrendous judicial delinquency and the vanishing point of jurisprudence *vis-a-vis* venal, venial and innovative violations by tenants on the high bench. Crime without punishment is lawlessness legitimised. The rule of law and life are repugnant to this systemic impotence.

So first things first. Let steps be taken by judges themselves to formulate a code of conduct. Similarly, the bar which has, alas, fallen into disrepute so much that Shakespeare, through Dick the butcher, used words which are unprintable but are on the lips of many in the country. Immediately, the Bar Council of India must painstakingly and creatively, with relevance to the prevalent pathology, draw up a professional code for the bar and suggest one for the bench. There is something of sorts even now but it falls short of what is needed in the light of the horrendous deviances in India of the poor millions aghast with Bofors. How many abettors 'of this sorry scheme of things entire' exist at the bar and maybe on the bench is gatherable only in private discreet, confidential conversation and investigation promising secrecy of source. There is something rotten in the state of Denmark. If what I have heard about judicial misbehaviour were true in a small fraction it may shock and shame us all. To protect the high integrity of the great majority of good judges, we must expose the meaner exceptions.

The bench cannot be corrupt if the bar is forthright. If the members of the bench commit crimes, they are amenable to the Penal Code even as they are amenable to traffic laws, immoral traffic laws and other punitive measures. It is wrong to think that there is a vaccination against prosecution of the judges and of the abetting lawyers if they commit common crimes from their professional eminence.

But it is from my deep concern to see that the judiciary is kept at a lofty level that I speak so bluntly. The scenario of great judges discharging their awesome obligations of office implies great regard on the part of the people to the judiciary which is the repository of justice incarnate. Supposing there are some delinquents, there must be a mechanism for correction lest the situation of entropy pathologically spread or deteriorate into a popular craving for revenge. I do consider the urgency of the need for a disciplinary mechanism, therapeutic and corrective in this domain where the process must maintain confidentiality and retain the judges' confidence and the whole disciplinary outfit and operation

must be functionally kept at an appropriately high level but assuring that no robe escapes from his wrong-doing. The desideratum is to create a structure at once high-powered but easy of access to the common people. Be you ever so high, if you are delinquent, the law is above you and may not spare you—that is the message. The subject of judicial accountability, considering the variety of aberrations of which judges are guilty, requires careful and realistic handling because many of the improprieties go unnoticed behind the iron curtain of Contempt of Court. Law of contempt has been overdrawn because it is of colonial vintage. Judges, like other constitutional functionaries, must face the law if they depart from or deceive the law. Justice is no cloistered virtue and the path of criticism, even if exaggerated, must be permissible since freedom of expression is a guaranteed right applicable as much for the judges as against the judges.

Let the bench-bar accountability to Indian humanity be high on the agenda of national, even constitutional, concern. Not the thoroughly useless judicial commission introduced into parliament some time back and is now deservedly dead.

Judicial accountability is no constitutional serendipity but a professional compulsion brought to the fore by the Bombay and Delhi explosions. But there is pervasiveness of judicial delinquents till now hiding behind the over-broad contempt jurisprudence of colonial vintage and the uncritical reverence the 'cult of the robes' commanded. Now that 'operation autopsy' and social audit of power donees have become integral to the democratic process, even the court and the judge must communicate with the country through a performance report, as it were; and where grave dereliction, even lesser crime or culpable conduct is observed, punitive and corrective proceedings must be initiated. The purpose is to rid the system of pathological offenders with the robes on and to inspire confidence that even justices are accountable. Norms of behaviour and ombudsmen of a high order to invigilate are essential components. If judges fail, that will lead to credibility collapse and harakiri of democracy.

CODE OF JUDICIAL ETHICS

A code of judicial ethics must be drafted after a public discussion. Maybe, a preliminary draft be made by the Law Commission, which may be circulated to the Indian Bar Council for scrutiny and response. Both these documents must go before the judges—the higher echelons and the subordinate judiciary. Simultaneously, these papers, together with the opinions and comments of state governments and the law academe, must be considered by the central cabinet and a white paper presented to the nation. The law of contempt and the immunity of judges and their independence must be deeply reflected on while finalising

the judicial code. Judges must be kept high, very high but not beyond the reach of the law save the impossible, even marginally obnoxious, jurisprudence of impeachment.

There must be a monitoring machinery lest the code be reduced to a *brutum fulmen*. Judges may not be scared by paper tigers, and so the code must both expose and, if unheeded, hit. A sentinel on the *qui vive*, if it is to be effective, must have statutory sanctions and powers. A collective ombudsman with absolute autonomy, mobility, fair procedure and graduated punitive/corrective and commendatory authority, with versatility conditioned by situations is the public necessity. A purposeful, competently trained infrastructure, with investigative skills, technological aids and delegated powers must be thought out, learning from the experience from other countries and remembering the native diseases. A judicial super-ombudsman composed of the most respected, highly independent team of three judges, one a retired judge of the Supreme Court, preferably a former chief justice without blemish, and one from the high courts, preferably a former chief justice of unsullied record and the third, a retired judge who has had vast experience in public life, involvement in public issues and an extra-judicial, even administrative career, may fill the bill. An advisory body, with high national status, may be an auxiliary. The attorney general, the president of the Bar Council of India, an outstanding lawyer-leader nominated by the president of India, a nominee each of the prime minister and the leader of the opposition from public life, a nationally recognised social activist, a great person of commitment to moral values, one each from among journalists, scientists, professionals and women's organisations. A few retired IPS, IFS and IAS officers may bring useful points of view to the body. These are flexible criteria but what is fundamental is the fearless, sensitive, activist public figures with a passion for preserving judicial purity, probity, practical integrity, and submission to the great traditions of justices, the humility of office, the rectitude, wisdom and concern for the common man and, above all, a becoming bearing free from arrogance and oblique tendencies and a standard, private and public, which reminds one that a judge's life like that of Caesar's wife must be above suspicion.

The degrees of judicial delinquency, the devious forms they take, their weaknesses and malpractices and the horrendous deviances never heard of in the judicial heritage of our country, are now common talk.

The versatile genius and the vagarious vices of judicial deviants take myriad shapes. Some judges, even of the highest court, do not believe in the creed of delivering judgments. They are a law unto themselves. During the seventies and eighties, justices and chief justices have practised the dubious art of non-delivery of judgments even years after arguments are closed. Some of

them have retired without pronouncing judgments, although long arguments, at great expense, have already been addressed. The entire protracted, terribly expensive forensic operation has had to be gone through over again. Strange but true, in some cases benches, consisting of a plurality of judges, have got into the habit of delivering judgments in instalments or separately with gaps, each doing it long after the others have done it. The embarrassment of law reporters is obvious. This Supreme Court trait is manifest even in High Courts. "If the salt have lost his savour, wherewith shall it be salted".

Some judges in the High Courts resort to the sneaky practice of pronouncing judgments and promptly taking them back home, with the result that nobody can see these hidden pronouncements. Copies obviously are not available for months. Indeed, even on the bench, the judges sometimes disagree violently and once one judge in anger left the bench abruptly. I can multiply instances of unbecoming behaviour and delinquent demeanour against which the bar is unable to protest, because courage oozes away sometimes or faction weakens possible action. The case for a judicial ombudsman is a formidable one. The law of contempt, behind which some judges indulge their follies, is too brittle a wall to defend against performance audit by the public through appropriate surrogates.

Far be it from me to anticipate verdicts in the Veerasamy episode and the Ramaswamy syndrome, since both are under enquiry. Although accumulated literature, through reports and case diaries, is unfortunately enormous, it is best to leave the verdict to the constitutional-judicial process. But conduct *a la* the Chawla melodrama takes one's breath away. The thrust of my submission here, away from individual instances of judicial felonies, is that we need an instrumentality which at once safeguards judicial dignity and independence on the one hand and tracks down judicial turpitude, overt or covert, through some effective ombudsman apparatus. I agree that "the place of justice is an hallowed place; and therefore, not only the bench, but the foot-pace and precincts thereof, ought to be preserved without scandal and corruption" (Francis Bacon). Remember the opinion of David Pannick on this point:

Litigants should have the power to refer to the commission a complaint about the conduct of a judge. The Lord Chancellor should have such power, and should be obliged to exercise it prior to dismissing a judge. (This would not prevent a judge resigning to avoid publicity on the matter.) In May 1986 Lord Hailsham expressed support for the introduction of an independent complaints board to investigate the facts and make recommendations to the Lord Chancellor prior to the dismissal of a Circuit judge. He said (understandably) that he was troubled by the absence of a fair procedure at present.

The jurisdiction of the commission would

need to cover all members of the judiciary and should not be confined to cases where the Lord Chancellor is contemplating dismissal. Whoever the complainant may be, and however high the judicial status of the investigatee, the value of the commission would be in the presentation of a reasoned, public, and objective analysis of the relevant criteria and of the facts of the case [Op cit, p 103].

A performance commission will impregnate the expression 'holding office during good behaviour' with living meaning.

Even judicial independence, a most important value of our system, cannot forbid bringing to book these guilty of judicial misbehaviour. Judge power is a critical factor of the highest importance in our constitutional order. For that very reason, the law must keep them away from lawless, immoral unethical and unbecoming conduct. Some cowardly judges and opportunist brethren obligingly bend their judgments when political heavy-weights and tycoons with clout happen to be parties. Some leading members of the Supreme Court bar wrote, not long ago, a complaint to a chief justice referring to holiday hearings and nocturnal proceedings where influential persons figured as parties. Even the Bhopal Gas catastrophe litigation and later settlement with judicial imprimatur have come in for sharp criticism, bordering on the needle of suspicion being pointed at five judges. This case is not merely an event but a portent and, the contempt barricade notwithstanding, may remain a polemical issue where the judges may not emerge with flying colours.

The process of saving the misbehaving judges from themselves and the community from those brethren whose allegedly culpable conduct is under investigation is fraught with difficulties under the current constitutional provisions. The accused judges, if deprived of allotment of work, may perhaps demand that until proved guilty, they are innocent and, therefore, as of right, must be eligible for allotment of judicial work. The chief justice, who is in sole charge of allotment of work to judges of the court, may have his own limitations and even prejudices. Pending enquiry he may ask the judge to sit idle and make the taxpayer pay his salary. If there is some constitutional provision for keeping judges under a cloud in suspended animation it may be possible for the chief justice to exercise his discretion. Suppose a chief justice misuses his power what restraint can protect the victim? Until a constitutional amendment is wrought, a convention may be woven, after consultation with the Indian bar, that if there is credible material supportive of the charge and if the charge is grave enough the suspected judge may be asked to proceed on long leave or dispose of formal judicial matters. Whether without any sanction rooted in convention or legislation the chief justice may withdraw all work from the accused judge is a moot matter. The best course would be, before arriving at the con-

vention I have mentioned, to persuade the incriminated judge not to create a crisis but step out of the cricket ground for a while. However, when some *prima facie* probative material is adduced, it is a grave risk to have an administrative court decision on the issue of 'to be or not to be'. The judicial trinity in the Ramaswamy affair has come to a conclusion without reaching a conclusion and stated that the judge may be guilty or not (to be discovered on further enquiry) but may continue to work. This gives the impression of a verdict of innocence to the laity while what has been held is almost the contrary. Sometimes, judges produce opinions which wear the inscrutable face of a sphinx, or to put it in Churchillian diction, they puzzle the people with 'a riddle wrapped in a mystery inside an enigma'.

I am aware that much can be said on both sides where judges are the subject of audit and punishment. Of course, politicians in or out of power and bureaucrats in or out of office sometimes commit shocking crimes but they are amenable to judicial justice. The court is the sentinel and the judges who operate it are too sacred for us. Indeed, we are proud of the quality of their performance, and the affirmation of their reputation implicit in the frequent demands for judicial enquiries. Even so, I must agree wholeheartedly with the view expressed about 'Judges and Co' by the brilliant barrister David Pannick. I quote him:

Some politicians, and a few jurists, urge that it is unwise or even dangerous to tell the truth about the judiciary. Judge Jerome Frank of the US Court of Appeals sensibly explained that he had 'little patience with, or respect for, that suggestion' I am unable to conceive... that, in a democracy, it can ever be unwise to acquaint the public with the truth about the workings of any branch of government. It is wholly undemocratic to treat the public as children who are unable to accept the inescapable shortcomings of man-made institutions. The best way to bring about the elimination of those shortcomings of our judicial system which are capable of being eliminated is to have all our citizens informed as to how that system now functions. It is a mistake, therefore, to try to establish and maintain, through ignorance, public esteem for our courts [Ibid, p 205].

Impeachment is a cumbersome procedure and offers the unjust extreme alternatives of death sentence of acquittal, with a heavy sprinkling of politics, polemics and party manoeuvrings. We want graded punishments for graded offences because that sentence is just which fits the offence and does not suffer from undue mitigation or immoderate exaggeration.

DYNAMIC DIMENSION OF ACCOUNTABILITY

Apart from individual misconduct of judges there is a dimension of institutional accountability whereby the judiciary and the country come closer together in understanding each other so that the problems, the

needs, the solutions and the common direction and progress of justice may be shared and solutions found. For instance, reporting to the nation on the *state of the judiciary* may be done on Constitution Day, November 26, each year. On that day, from the Supreme Court down to the floor level forum, including the various tribunals, there can be a reporting by the judges and the lawyers to the people about the problems confronted by the courts like budgetary deficiencies, modernisation of fossilised procedures, technological upgradation to improve the efficiency of justicing, other requirements like more judges, more specialisation, more management skills in regard to the administration of justice by appointment of administrators with expertise thereby releasing more judicial time for judicial work and so on. The bar too may have similar issues needing reporting. In the same way, and perhaps on the same occasion, there can be reporting by the communities, leaders like legislators and public figures, educational heads and management specialists and the state's surrogates pointing out their problems *vis-a-vis* the court system—their inconveniences, even victimisations, on account of judicial mismanagement, indifference to people's needs and other aspects of maladministration and neglect of public interest by the courts and the changes they may wish. There should be periodic ongoing education for the judges as a systemic necessity; there should be annual reports made by the various courts which will go beyond mere statistics but will tell the community about the social trends reflected in litigations and consequential corrections recommended by the judges. These reports must suffer parliamentary discussion, legal profession's study and popular seminars and so on. The social function of the court is not exhausted by mere adjudications of disputes and disposals of cases. There is a creative dimension to what the judiciary can do to inform and improve society about many diseases that afflict the populace like new types of crimes, irresponsible divorces and other maladies about which notice may have to be taken in time. On the whole, there must be a vigorous social and even political interaction, where even violations of human rights by the state may figure high on the agenda. The state's agencies may have their grievances against the judiciary and the judiciary in turn may have its grievances against the state and the delays it causes and the failure of justice to which it contributes. More and deeper insights and dynamic interactions can be discussed on this theme. But the purpose here is only to point out that accountability does not mean mere control of judicial delinquency.

The bar too has much to account for because of pathological degradation in its performance and the responsibility it owes in promoting social justice. That is an independent subject although close to judicial performance. The bench and the bar

are the two vital limbs of the administration of justice. The integral yoga of justicing and lawyering, with profound concern for justice social, economic and political, is the focus which up to now has been blurred in discussions on justice, justices and justicing.

Justice is what justice does. What is justice? I quote what Cappelletti once said:

The right of effective access to justice has emerged with the new social rights. Indeed, it is of paramount importance among these new rights since, clearly, the enjoyment of traditional as well as new social rights presupposes mechanisms for their effective protection. Such protection, moreover, is best assured by a workable remedy within the framework of the judicial system. Effective access to justice can thus be seen as the most basic requirement—the most basic 'human right'—of a system which purports to guarantee legal rights.

The New Zealand Law Journal (No 4, p 66):

today it is unreal to suggest that a person looks to the law solely to protect his interests in a narrow sense. It is necessary to do no more than read the newspapers to see the breadth of the interests that today's citizen expects the law to protect—and he expects the court where necessary to provide that protection. He is interested in results, not procedural niceties.

Processual justice to the people compels us to respond to the stormy challenges of the present, reject the dogmas of the dead past and liberate legal technology from the stranglehold of misty legalese, forensic mystiques and jurisprudential antiques which frustrate the founding faiths of our constitutional order.

To lend life to this credal essence of judicial justice we need judges of calibre, not clever ones, not even ones very competent.

in legal learning but dubious, immoderate and dedicated to wheeler-dealer processes. Canons of judicial conduct and professional ethics, codified or not, proceed on the fundamental assumption that a judge is more than a member of the state's salariat but an instrument of justice and therefore obliged to observe those norms and possess those standards which convince the public that it can repose confidence in him/her for the delivery of unpolluted justice to the people without fear or favour, affection or ill-will. Judges are not angels but are more than money-bees and business managers. Each occupation has its nobility which he who sits in that office holds out as binding on him.

Why is the robed fraternity subjected to higher discipline? I cull out portions from the Report of Panel of Referees to the Minnesota Court of Appeals in Justice John J Todd's case.

The view expressed by Martineau in 10 University of Baltimore Law Review 225, at 227, puts it well:

The ultimate reason for any type of judicial discipline is to maintain public confidence in the judiciary. The logic behind this principle is simple. A legal system can function only as long as the public accepts and abides by decisions rendered by the courts; the public will accept and abide by these decisions only if it is convinced that the judges are fair and impartial, anything that tends to weaken that conviction should be avoided. In other words, justice must not only be done, but must also appear to be done. For this reason, judges are commanded to avoid not only actual impropriety but also the appearance of impropriety in all of their activities.

A common thread running through the foregoing rules under which judges must operate is that the perception of them and their functions by the public is crucial to the proper administration of justice and the orderly functioning of society.

Part and parcel of the foregoing comment is the age-old rule, cited by some of the cases herein, and as fundamental to the proper administration of justice, that justice must not only be done, but it must also be perceived to be done. The Supreme Court, as recently as 1979, repeated the foregoing maxim in the form of the following:

The effective functioning of the judicial system depends not only on justice in fact being administered but that citizens feel they are being provided fair treatment and just decision. *In Re McDonough*, 296 NW 2d 648, at 697 (Minn 1979).

It is undoubtedly for the foregoing reason that the rule is universally followed in court disciplinary actions that

... judicial removal is neither civil nor criminal in nature, but *sui generis*, designed to protect the citizenry by insuring the integrity of the judicial system. *In Re Gillard*, 271 NW 2d 785 (Minn 1978).

The Supreme Court has frequently stated, with respect to the discipline of attorneys, that

As we have so often stated, the purpose of discipline is not primarily punitive, but,

'to guard the administration of justice and to protect the courts, the legal profession and the public'. (Italics supplied.) (*In Re Serstock*, 316 N W 2d 559, 561 (Minn 1982). Cf *In Re Kimmel*, 322 NW 2d 224, 225 (Minn 1982).

Judges, of course, are held to an even higher degree of integrity than attorneys.

The burden imposed upon those who accept judicial office by the Canons of Judicial Conduct are even higher than those required of practicing attorneys by the Code of Professional Responsibility. This is as it should be, in view of the extraordinary responsibility of judicial office. We touch upon this distinction here to emphasise the stringency of the standards of conduct to which members of the judiciary are and must be held. The Canons of Judicial Conduct are standards measuring fitness for judicial office and therefore embrace tests of behaviour relating to integrity and propriety that condemn actions in which the average citizen can freely indulge without consequences. *In Re Douglas*, *supra*.

Since, therefore, disciplining is not done to punish the offender but to maintain the strength and position of the judiciary, it inexorably follows that the public perception of the judge in question is critical to both the issue of the court's actions violating the

rules and to the issue of what sanctions, if any, should be imposed. Cf *In Re Storie*, *supra*.

When judges move with majesty towards their seat in court with silvered mace and liveried escort there is a message to himself and to the public. The Minnesota panel, while mentioning the relevance of the people's perception of the judge's conduct, answers.

Lastly, whether the perception of the judge in question on the part of the public is accurate or inaccurate, why is such perception important in our system? To ask that question is to ask other questions of a similar nature. Why must judges take an oath of office? Why do judges sit at a higher level in the courtroom than other persons present? Why do judges wear robes while in the courtroom? Why do people stand when the judge enters the courtroom? Why are decisions of life, death, and property rights given to such persons for resolution?

The answer to all of the foregoing questions is the same, namely, because the respect of the public for the court, based upon its perception of the integrity and dignity of such court, convinces those dealing with it to trust it, to believe in it, and to permit it

HUDCO RESEARCH FELLOWSHIP PROGRAMME: 1991-92

HUDCO offers fellowships for research in the area of Housing and Poverty Alleviation. The proposed study should relate to subjects specified below.

- 1) Local Public Agencies and Home-based enterprises. Regulation, Procedures, and Institutional aspects.
- 2) Promoting home based economic activities in housing projects: Implementation and local community aspects.
- 3) Socio-economic aspects of settlement consolidation: The role of local resident and trade associations.
- 4) The implementation experience of urban poverty alleviation strategies. The role of NGOs, local public agencies, and elected representatives.
- 5) Combining urban poverty alleviation programmes with local developmental activities: Limitations and opportunities.
- 6) Upgrading slum areas. The impact on home, and neighbourhood based economic activities.
- 7) Economic, social, and employment linkages between low income areas at a city or metropolitan level.

Fellowship amount varies from Rs. 20,000/- to Rs. 45,000/- Please submit research proposals at the following address.

Senior Fellow (Research)
Human Settlement Management Institute,
212, Asian Games Village, Khelgaon Marg,
New Delhi - 110 049.

Last date for receipt of proposals is September 15, 1991.

hudco

to handle their most important matters of life and property.

The rationale behind the canons and their enforcement is not far to seek. Lest I should be misunderstood as sermonising, let me quote from the Minnesota Report:

In judicial discipline cases, the foremost and primary obligations of the whole judicial disciplinary system are the protection of the public and the administration of justice. The interests of the individual judge are considered but they are not foremost. The primary purpose of discipline is not punishment, even though it may impose a penalty upon the individual judge. The proceedings are not criminal and the criminal standards of due process do not apply.

Although there is some risk that the lesser standard may cause imposition of sanctions upon judges importunately, the interests of the administration of justice demand that the error be on that side rather than on the side of retaining without forfeiture a judge whose effectiveness is damaged in the public view. As unfair as this may seem in the abstract, there are positions of authority in society which demand such treatment, where sanctions are imposed and accepted without imposition of the beyond a reasonable doubt standard. The privilege of serving in these positions carries concurrent responsibilities to avoid misconduct and interference in the administration of justice so that confidence in the system is maintained. Certainly, the position of judge is one of these.

Some judges think that disciplinary power over their peers may be left to the chief justices. Unfortunately, there are many instances where complaints have come against chief justices and judges themselves, in private, admit the chiefs to be overbearing or dubious. More than that, chief justices have their own prejudices and many high courts (is the Supreme Court an exception, I wonder) are not free from factions and the domineering moods of judicial heavyweights. Even their lordly social philosophy is distances away from the ideology of the socialist secular republic of India. It is widely known that chief justices even of the Supreme Court have abetted or arranged hearing of bail petitions of VIPs on holidays and after nightfall. A senior-most judge of the Supreme Court, who later became the chief justice, and another senior-most judge of the Supreme Court, who also became a chief justice later, did hear criminal matters on an abnormal day or at an abnormal hour making a special exception for the accused tycoons. This resulted in some dissatisfaction at the bar. Indeed, if we draw the line of objectionable conduct with socialist sensitivity the discrimination in favour of influential petitioners makes the conduct of the judges venal. It is also reliably rumoured, perhaps, that a chief justice of Punjab and Haryana high court was not consulted in the appointment of a judge to his high court, and likewise a judge of the Supreme Court was appointed even though the chief justice of that time had not consented to his appointment. Other instances can be

discovered, without much research, about deviances by chief justices themselves. Therefore, to make a class distinction between chief justices and puisne judges on the assumption that chief justices are superior beings does not hold good. On the contrary, some chief justices are susceptible to executive pressure and blandishments but it is not fair to divulge that here. For the sake of the extension of age of retirement, for perquisites which are not extended to other civil servants and so on, judges have been passing resolutions and getting their points accepted by governments. Here is a case of judges as a class showing anxiety to secure executive favours—not becoming conduct for those who have to sit in judgment over the benefactors.

Legal sanctions against judicial delinquency are a necessity if the globorama of robed souls robbing the bench of its great integrity and impressive good behaviour is to be arrested. But the escalating misconduct of judges has often gone unpunished because the law of judicial accountability is still in its infancy. Barring the extreme measure of impeachment the law is silent, so much so, worldwide one might well say that, with marginal exceptions, accountability of the judiciary to the country is the vanishing point of jurisprudence. This void,

unless competently covered by well thought-out legislation, may militate against the democratic credibility of the high institution which is so central to human justice. While judicial independence is a valiant check against executive-legislative tyranny, absent judicial accountability may portend a forensic despotism. The subject is delicate, the remedy, unless carefully adjusted, may aggravate the malady. Crude nostrums may prove iatrogenic and so experiences in various democratic countries must be garnered to win the principles and processes whereby the best system of checks can be evolved. Justice has a global dimension in our age of human rights and the twin components of independence and accountability also are matters of universal concern.

Judge power is vast and strong in the keeping of those who are fearless and flawless surrogates of public justice. But the judiciary as a fiduciary must pay a price—they must be clean in public and private life, on the bench and off the bench and be worthy to be watchdogs, not lapdogs, sentinels, not sycophants.

The justice system is our only stable asset, as yet not corrupt. Let us preserve it. Public justice is too serious a business to be left to the justices alone. We need a national debate on this theme.

HUDCO RESEARCH FELLOWSHIP PROGRAMME: 1991-92

HUDCO offers fellowships for research in the area of Urban Infrastructure Finance. The proposed study should relate to subjects specified below:

- 1) Economic and financial appraisal of infrastructure projects.
- 2) Inefficiencies in implementation of infrastructure projects and measures to remove them.
- 3) Operation and maintenance of infrastructure projects: Financial and institutional aspects.
- 4) Private sector and supply of infrastructural facilities and its impact on quality of supply and price.
- 5) Relative cost of different systems of fulfilling water requirements for different uses in the city.
- 6) Assessment of demand for water in urban areas.
- 7) Demand and supply for water in the informal markets.
- 8) Alternative mechanisms of financing city water supply systems.
- 9) Cost recovery in urban infrastructure projects.

Fellowship amount varies from Rs. 20,000/- to Rs. 45,000/-. Please submit research proposals at the following address:

Senior Fellow (Research)

Monitoring Budget Deficits with Time Series Models

J V M Sarma

The ministry of finance had come up last year with a method of determining normative levels of budget deficit at the end of each month of the fiscal year, using time series models of the Box-Jenkins type. Recently, Madhur and Wadhwa have contested the validity of the model specification. This note attempts to clear some of the misunderstandings expressed by Madhur and Wadhwa regarding the model used in the Technical Note. In brief, it shows that the criticism levelled against the model is not quite warranted and the points raised are inconsequential.

I

Introduction

IN an attempt to closely monitor the central government budget deficit the ministry of finance had come up last year with a method of determining normative levels of budget deficit at the end of each month of the fiscal year, 1990-91 against which the actual deficit can be assessed [Government of India, 1990]. The *Technical Note* (TN) considered several alternative methods of deriving the monthly norms and proposed the use of time series models of the Box-Jenkins type, for the purpose. As an illustration, the authors of the TN fitted a seasonal Auto Regressive Integrated Moving Average (ARIMA) model to monthly deficit data over a 10 year period (April 1980 to March 1989) and found that within this class of models, a particular specification comprising a secular component and a seasonal component was more suited for the purpose than other models considered.

Prior to the fitting of the model, the data were subject to two transformations. The first one, although not explicitly stated in the TN, follows from the non uniform nature of data series collected by the ministry, which were in the form of month end positions of the yearly budget deficits. Thus, although the March end figure might be non zero for a year, the starting figure for the next year was set at zero, which is consistent with the way the yearly budget deficit is commonly viewed. For the empirical exercise, these month end series were converted into a uniformly defined monthly change series so that each data point denoted the deficit incurred during the corresponding month. Further, the data series were transformed into a 12 month differenced series as they were found to be yearly non stationary as revealed by their plot and also confirmed by the sample autocorrelation function (SACF). The fitted model explained over a half of the past movements in terms of two yearly, and one monthly, autoregressive lags.

Recently, Madhur and Wadhwa [1991] have contested the validity of our model specification used in the TN. Their criticism pertains mainly to three aspects of the TN: (a) the choice of the Box-Jenkins models in preference to other types of models; (b) the forecasting ability of the model used; and

(c) the exact specification of the model. In particular, they have questioned the second stage (12 month) differencing of the series, alleging that it was done without conducting any rigorous scientific tests for the existence of stationarity of the monthly deficit series. In an attempt to do the empirical exercise, they have conducted certain statistical tests for the existence of stationarity in the series. However, these tests are recommended in the literature in the context of non multiplicative autoregressive linear models and therefore, their validity for multiplicative models such as the one used in the TN is debatable. On the basis of these misplaced tests they have wrongly concluded that the yearly differencing of the deficit series as done in the TN was not required. Accordingly, they have re-specified the model without differencing in terms of one yearly lag and one monthly lag, and claimed that the modified version fitted (on fewer than available observations) and forecasted better than the one used in the TN.

The objective of this note is to clear out some of the misunderstandings expressed by Madhur and Wadhwa (MW) regarding the model used in the TN. In brief, the criticism levelled against the TN by MW is not quite warranted and the points raised are inconsequential. Their modification of the model is based on misspecified stationarity tests and as such, does not connote substantive modification, let alone improvement, of the model used in the TN. In what follows I shall elaborate on these points.

The study plan is as follows. Since it is the third point of criticism that led MW to look for an alternative specification, we consider it as a substantive point, and devote the next two Sections II and III to dwell on it. Section II gives reasons as to why we resisted from conducting these 'formal' tests for the TN. An important reason was that these tests cannot be applied to multiplicative models without substantial modifications. This point is elaborated in Section III and the possible modifications needed are indicated. Section IV takes a critical look at the alternative specification proposed by MW where its validity is questioned by arguing that the tests leading to the modified specification are misplaced and therefore, it does not stand to reason. Then, the remaining two points of criticism are taken up for

clarification in Section V. And Section VI contains the concluding remarks.

II

Choice of Stationarity Testing Methods in TN

The critics felt that the use of the 12th differenced series of the monthly deficit as a dependent variable without conducting stationarity tests such as the Dickey-Fuller led to overdifferencing and, as a result, misspecification of the TN model.

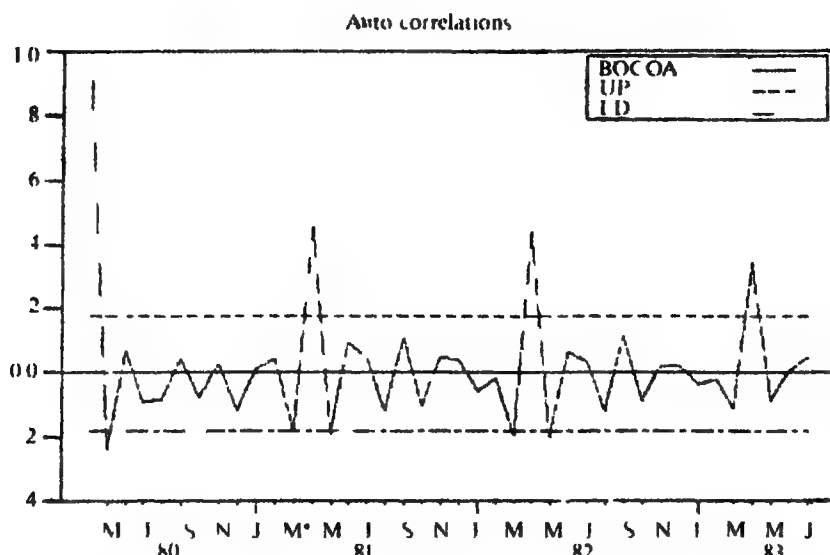

As the critics are well aware, the need to include a differencing factor in Box-Jenkins models arises if the autoregressive filters in the model are non-stationary (nevertheless, homogeneous). It is true that occasionally, in borderline cases, the traditional or informal methods employed for detecting non-stationary behaviour, such as examination of the plot of the series or its differences, inspection of the sample autocorrelation function (SACF) or informed inspection of a fitted model of a predetermined specification for a unit root, might make researchers face certain difficulties. These ambiguities, albeit rare, necessitated the search for alternative test procedures, generating sizeable literature.

Yet, for the empirical exercise in the TN, we had relied upon the SACF of the monthly (redefined) budget deficit series, rather than the more formal tests mentioned by the critics, for the following reasons.

First, recourse to such tests was advocated in the literature mainly to such occasions where conventional tools cannot resolve the question. However, in the case of the TN, the plot of the SACF (see Figure) left little doubt regarding the non-stationary nature of the series and clearly indicated significant autocorrelations for 12th, 24th and 36th degrees while the intra-year autocorrelations are not significant. The failure of the yearly autocorrelations to dampen quickly prompted us to suspect non-stationary behaviour of the budget deficit series between years.

Second, the non-traditional methods are not free from statistical ambiguities. Their precarious nature is clear from the caveats put on their use by those who developed them. Most part of the theory underlying these tests applies for deciding the last degree of differencing. While reviewing these tests

FIGURE 1. SADF OF MONTHLY BUDGET DEFICIT

Dickey, Bell and Miller [1986] make it amply clear, "Before proceeding, we need to make an important qualification. The theory we shall discuss applies only to the case $d=1$ (first differencing), that is between one and no differences y_t (the series under study) could be an already transformed series including the important case of seasonally differenced series. Thus, we assume that the other techniques mentioned (informal examination of plots, ACFs, and finite models) or other knowledge about the series can be used to discover all differencing factors except the last ∇ (difference)" [Dickey, Bell and Miller, 1986, p 12].

To be more specific, an important limitation of the Dickey and Fuller [1979] test is that the order of the AR and MA polynomials, even for a non multiplicative BI model, should be known prior to determining the degree of differencing, which is usually not the case. Later, although Said and Dickey [1984] developed a test by showing that it is possible to approximate an ARIMA (p, d, q) by an autoregression whose order is a function of the number of observations, the disadvantage, however, is that the approximate autoregression contains a number of parameters which are of 'nuisance' value, yet are to be estimated along with the first order coefficient. The alternatives suggested by Phillips [1987] and Phillips and Perron [1988] that do not need prior knowledge of p and q , and also avoid using a long autoregression recommended by Said and Dickey, still require approximations for truncation of lags in estimating the population error variance, that is essential for computing the z statistic.

Third, in most cases, the test statistics are obtained by OLS regressions of specifications involving lagged dependent variables. If the model also consists of a moving average process, OLS might yield biased coefficient estimates.

Further, economic reasoning also makes it sensible to suspect non stationarity in the

yearly budget deficits at least due to the price effect, which cannot always be taken care of by incorporating time trend variable in the model.

Thus, the alternative methods of determining the degree of differencing are not without limitations, and a foolproof method still eludes researchers.

The implications of wrongly testing for the unit root models were studied by Nelson and Kang [1984] and Plosser and Schwert [1978]. It was shown that out of the three distinct possibilities, viz, differencing removal of linear trend, and doing nothing the last alternative, namely, doing nothing when differencing is needed can have dire consequences, frequently leading to falsely significant regressions of non stationary series on time and on other independent non stationary time series. On the other hand, the consequences of unnecessary differencing were shown to be far less serious inefficient though unbiased and consistent parameter estimates.

In any case, over differencing is not as dangerous as under differencing as brought out clearly by the past studies. In fact the designers of the stationarity tests over the years have sought to build a bias in favour of over differencing. While surveying the literature on unit root testing, Dickey, Bell and Miller make it clear in no unambiguous terms "We do this because of what we perceive to be the relative importance of the two possible errors in deciding on differencing. Failure to include a differencing operator when it is needed results in bounded forecast intervals that must eventually be too narrow, giving unreasonable confidence in the forecasts, especially the long term forecasts. This can be especially true if a polynomial trend plus stationary error model is used when differencing is needed. Even if the polynomial trend fits well over the span of the observed data, extrapolating it implies a strong assumption about the future and this may well produce highly

unrealistic forecasts and forecast intervals. It is also quite possible for the polynomial to fit poorly at the last data points, resulting in poor short term forecasts. On the other hand, differencing when a ∇ is not needed is unlikely to have serious consequences. Such overdifferencing can even produce forecast results equivalent to those from a model without a ∇ [Harvey, 1981]. Overdifferencing can also sometimes be detected and corrected at the modeling stage [Abraham and Box, 1978]. At worst, use of ∇ when $1 - \rho B$ with $\rho < 1$ is more appropriate will tend to produce more conservative forecast intervals" [Dickey, Bell and Miller, 1986, p 16].

The single most important reason as to why we did not resort to these formal statistical tests was the ambiguities posed by them for multiplicative models. The difficulty of applying these tests to multiplicative models will be clear from the very design of such models as can be seen in the next section.

III

Stationarity Testing in Multiplicative Models

In general, a seasonal multiplicative model ARIMA $(P, D, Q)^s(p, d, q)$ represents the process

$$(a_p(i) \phi_p(\lambda) (1 - i)^d (1 - \lambda)^q x_t - b_q(i) \nabla_q(\lambda) \varepsilon_t) / (4) \text{ where } a_p(i), \phi_p(\lambda), b_q(i), \text{ and } \nabla_q(\lambda), \text{ are polynomials in the backshift operators, } \lambda \text{ and } i \text{ (where } i = \lambda^s, s \text{ being the width of the seasonality), and } \varepsilon_t \text{ is the white noise.}$$

The model being multiplicative, the relevant characteristic equation is a product of two polynomials, one for the inter year variation and the other for intra year variations. As such there could be four possibilities. The series could be (a) stationary with respect to both the inter as well as intra year variations, (b) stationary only with respect to intra year movements and homogeneous with respect to inter year movements, (c) stationary with respect to inter year movements and homogeneous with respect to intra year movements, and (d) series are non stationary but homogeneous. Cases (b) and (c) denote a kind of partial stationarity, while (a) refers to the full stationarity for multiplicative series and case (d) would imply non stationarity.

Thus while the situation of full stationarity implies that both the AR polynomials $a_p(i)$ and $\phi_p(\lambda)$ should satisfy the stationarity conditions separately, the disadvantage with testing for stationarity in the combined polynomial, $[a_p(i) \phi_p(\lambda)]$, is that even when the roots of the combined polynomial lie outside the unit circle, it does not ensure that the roots of both the component polynomials also do so. This can be shown by extending the derivation of the testing equation. While a comprehensive discussion of all the problems involved in such an extension would require a separate study, a ten

tative version of the testing equation for seasonal models can be derived by proceeding as follows

The problem now is to decide about the last differencing for both the non-seasonal (yearly) as well as the seasonal (monthly) component processes. As in the case of non seasonal models, to simplify let us consider the series as already transformed upto the last but one differencing for each of the component processes. Accordingly, consider the process,

$$(1-r_1)y_t = c_1 + u_t \quad (1)$$

$$(1-\rho\lambda)u_t = c_2 + e_t \quad (2)$$

where (1) and (2) represent the yearly and monthly component processes respectively, y_t and e_t denote the respective transformed series up to the last differencing such that $y_t = \nabla_{12}^D \nabla_{12}^S \nabla_{12}^T (i)x_t$, and $c_1 = \delta_0(\lambda)(\phi_p(\lambda)\nabla^d)^{-1} \epsilon_t$, r and ρ , the first order coefficients to be tested, and, c_1 and c_2 constants (indicating possible mean 'drift' of the series)

The Dickey Fuller type of equation can be obtained as follows. From (1), substituting the value of $u_t = (1-r_1)y_t - c_1$ in (2) we obtain,

$$(1-\rho\lambda)(1-r_1)y_t = (1-\rho\lambda)c_1 + c_2 + e_t \quad (3)$$

And, using the decompositions,

$$(1-r_1) = (1-i) + (1-r_1)i, \text{ and}$$

$$(1-\rho\lambda) = (1-\lambda) + (1-\rho\lambda)\lambda, \text{ the final testing equation can be obtained as}$$

$$\nabla y_t = (q-1)y_{t-1} + (r-1)y_{t-12} + (1-\rho\lambda)c_1 + c_2 + e_t \quad (4)$$

where $\mu = (1-\rho\lambda)c_1 + c_2$. Similarly assuming that e_t is weakly dependent and heteroskedastic, the Phillips Perron type of testing equation can be derived for the multiplicative models as

$$y_t = \rho y_{t-1} + \tau \nabla y_{t-1} + \mu + e_t \quad (5)$$

The equations (4) and (5) imply that the tests for seasonal and non seasonal differencing have to be conducted simultaneously and separate testing will lead to specification bias. On the practical side while the Dickey Fuller version of the testing equation is conditional on the prior knowledge of the orders of the polynomials involved the Said Dickey version would involve truncation of two autoregressive polynomials resulting in even longer testing equation with more nuisance parameters. As for the Phillips Perron version the z transformations suggested for non multiplicative models may no longer be valid as the assumption of the composite error being 'weakly dependent and heteroskedastic' may not hold. Also the z transformations involve double truncations of the lag order for computing the population variance.

In an attempt to check the correctness of the yearly differencing decision in the TN model, we have fitted the testing equation (4) which is as follows

Data from June 1983 to March 1989

$$\begin{aligned} \nabla y_t = & 1.01y_{t-1} - 0.015y_{t-12} \\ & \tau_u = (-0.23) \quad (-0.29) \\ & + 0.964y_{t-11} + 204.86 + e_t \quad (6) \\ & (7.37) \quad (1.45) \end{aligned}$$

$$R^2 = 0.51 \quad \sigma = 994.8 \quad DW = 2.009$$

The regression results show that the hypothesis of unit root at 12th lag cannot be rejected. Although this result appears to confirm the pattern of the SACF and justifies the 12th differencing of the series in the TN model, I would not recommend the test as a pre specification tool for determining the order of differencing.

IV

Testing and Reestimation

A Critique

The study by MW is an attempt to redo the empirical exercise, ostensibly with a view to improve upon the model used in the TN. Much of the empirical work has been on the same lines as in the TN. They also started by converting the cumulative month end series of the budget deficit into monthly change series. Further, despite their criticism regarding the choice of the Box-Jenkins model in the TN, they did not seem to be averse to using the seasonal ARIMA models. The crucial difference between the TN and their study, however, stems from the decision as to whether or not the seasonal (12 month) differencing is needed.

MW, in their eagerness to conduct formal tests, have misspecified the testing equations. For example, to conduct the Dickey-Fuller type of testing, two separate equations were specified, one for monthly and the other for yearly differencing (of course with and without the time trend in each case). The equations are

$$\nabla x_t = \mu + (1-1)x_{t-1} + e_t \quad (6)$$

where x_t is monthly deficit $t-1$ to $t-12$, $t-1$ and with the null hypothesis $\mu = 1$. Similarly the Phillips-Perron test is based on the equation of the form

$$x_t = \mu + x_{t-1} + e_t \quad (7)$$

with the hypothesis that $\mu = 1$. Two alternative hypotheses were considered: (i) unit root exists at lag 1 and (ii) unit root exists at lag 12. For each of these two variants were investigated, namely with and without a time trend.

The main flaw in the testing for the unit roots by MW lies in the specification of the test equation. As we have seen in the previous section, unit root testing in multiplicative models involves simultaneous estimation and testing of hypothesis for both seasonal as well as non seasonal differencing. Accordingly, the test equation to be estimated should be either the form of equation (4) or equation (5). Instead, MW have sought testing for the stationarity of the combined polynomial which can be achieved even when one of the component polynomials is non stationary. Even if their separate testing procedures showed that the series are stationary, it does not ensure stationarity of the component series.

Incidentally, an aspect of the estimation in MW that cannot go unnoticed by discerning readers is that the re-specified model

is fitted on fewer than available observations. Thus, out of the total data span from April 1980 to March 1989, the specification in terms of one yearly, and one monthly lags leaves the researchers with as many as 95 observations (from May, 1981 to March 1989). Yet MW have chosen to fit the model only on 59 observations from May 1984 to March 1989. Trivial may the decision seem, it has implications for long term forecasting with their specification. While their reason to drop as many as 36 initial observations is not known, re-estimation of their model on all the available 95 observations, gives a clue regarding its inconsistency. These regression results are as follows

Data: May 1981 through March 1989

$$(1-0.47\lambda^1)(1+0.16\lambda)x_t = 379.6 + e_t \quad (7)$$

$$t = (4.55) \quad (1.48) \quad (1.66)$$

$$R = 0.23 \quad SSE = 1369.8 \quad DW = 1.98$$

The regression results (7) are widely different from those obtained by fitting the specification on the 59 observations from May 1984 to March 1989. Thus, their model specification can at best be regarded as locally efficient and may not be useful for longer time forecasting.

V

Other Aspects of Criticism

CHOICE OF THE MODEL

It is alleged that the TN abstained from any objective criteria while preferring Box-Jenkins models to other types of models for deriving the budget deficit norms. The critics feel that the crucial issue is not whether the Box-Jenkins model is procedurally superior to the other methods but whether, on the average, it forecasts month end budget lefts more accurately than the other method.

This criticism is based on lack of understanding of the general nature of the Box-Jenkins models. The main reason for preferring Box-Jenkins models in the TN was not due to their procedural superiority to other, but due to the elementary fact that this wider class of processes provides a range of model stationary or non-stationary that adequately represent many of the time series met in practice. [Box and Jenkins, 1976, p. 81]. As such, Box-Jenkins models encompass most of the other commonly used models such as the growth trend equation models, random walk models, exponential smoothing models and so on, which can be derived as special cases by imposing suitable restrictions. The purpose of preferring these other models in the TN was only to bring out the maladies of restricted specifications. By nature, being more general, Box-Jenkins models suffer less from specification bias.

In fact, it is doubtful if one can regard Box-Jenkins models as *procedurally* superior to say a restricted model such as the trend equation. Unlike these restricted models, Box-Jenkins methods involve cumbersome, and often not very objective procedures per

taining to, identification of the degree of differencing, determination of orders of polynomials involve, as also estimation by iterative procedures. Thus, procedural convenience is certainly not the main consideration for preferring these models. The main reason for the choice of the Box-Jenkins models is the amount of freedom they afford in identifying and capturing the trend components.

NATURE OF FORECAST NORMS

Regarding the nature of forecasts of month-end deficits from the model presented in the TN, it is pointed out that for all the twelve months of the forecasting horizon, i.e. fiscal year 1989-90, the forecasts were consistently lower than the actual month-end deficit which does not speak well for the particular Box-Jenkins specification.

To begin with, the critics have wrongly assessed the out-of-sample forecasts derived in the TN. Presumably, they have come to their stated observation after comparing the cumulated forecasts (Table 2, column 5 of the *Technical Note*) from the specified Box-Jenkins model, with the actual month-end deficits (Table 2, column 2). Actually, as can be expected, since the model was fitted on monthly change series, the forecast inference results do not apply to the cumulative month-end budget deficits but to the monthly change series, whose forecasts were later converted into month-end deficits to be compatible with the original series. Thus, on the basis of these cumulated forecasts it is difficult to conclude if they are biased. The correct way of judging would have been to compare the non-cumulated forecasts and with corresponding actual monthly-differenced deficit series. Thus, a major reason for the observed 'consistently' different trend, is built in the way the deficit series is viewed. Once the transformation process is clear, it is not difficult to understand the biased trend of cumulated forecasts. Just one wide outlier data point could be sufficient to shift the subsequent trend of the accumulated forecasts. This shift could be even more prominent if forecasts for subsequent months of the year are based on previous months' forecasts, which is the case in the TN.

In fact, the unbiased nature of the forecast errors is clear even from the regression diagnostics presented along with the results (see Appendix Table A.3 of the TN). Given the adequacy of the model as represented by the R-bar and the SEE, the RMSE, the MAPE, the Q-statistic or the plot of residuals do not suggest any consistent bias in the residuals.

This leads us to believe that the phenomenon of the forecasts for the twelve month period (1989-90) being consistently different from the actuals, could be due to certain 'shocks' in the form of policy changes occurred during the forecast period that might have generated a higher than the past trend in the actual monthly budget deficits.

VI Conclusion

Thus, in brief, the criticism levelled against the model is not quite warranted. Also, their alternative model specification can, at best, be regarded as locally efficient and may not be useful for longer time forecasting.

All this, however, is not to say that the model specified in the TN is final and there exists no scope for improvement in several aspects. As mentioned in the TN, there could be a host of factors other than seasonality and trend, which influence the deficit of the government at any point of time, and that it is necessary to take into account the impact of all relevant economic variables having a significant bearing on the level of the deficits. The re-specified version by MW also suffers from these drawbacks, and to that extent, cannot be taken as methodologically much different from, let alone superior to, the original specification.

More importantly, the technical 'innovations' suggested by MW leading to the modified model, does not stand theoretical reasoning. In particular, it is doubtful if the so-called 'rigorous' tests of stationarity conducted by MW are valid in the context of multiplicative autoregressive models. In the absence of better test procedures, the conventional methods relied upon by the authors of the TN, based on the SAC I, appear to be more relevant.

Institutional Credit and Overdues

D Rajasekhar

G Suvarchala

I

STUDENTS of political economy have been arguing that, in the rural areas, the financial system has been subordinated to the interests of the rural rich. Pointing to the growing political clout of the farmers' organisations, reflected in the prominence of political stalwarts like the late Charan Singh and Devi Lal, it has been argued that the rural banking system has been (mis)used to provide subsidies and easy money for those who belong to this class. Overdues to the banks are only a symptom of this basic malaise.

Be that as it may, we are grateful to A S Kahlon for initiating a debate on this important issue ('Institutional Credit and Overdues: Borrowers' Angle' *LPM* February 2 1991) within the narrower framework of the existing financial system. The main argument of the paper is that the loan policies and procedures of lending institutions have impaired the borrowers' ability to secure adequate incremental returns to enable them to repay their loans. Consequently, the overdues have been mounting. The author, by using evaluation studies, District Oriented Monitoring (DOM) studies and supply side studies conducted by NABARD in the early 1980s (which are not easily accessible to researchers), highlights the impact of factors like under financing, tight repayment schedules, absence of initial grace period, short loan maturities and delays in sanctioning of loans, on overdues. While emphasising these points, the author has noted the hiatus between actual implementation and the set guidelines. For instance, as per the guidelines of NABARD, a banker must give 11-15 years' time to the borrower in order to enable him to repay instalments for schemes like dug-well with pumpset. However, in reality the borrowers are provided with only a 10-year term. Similarly, the author has noted the variation between the actual unit cost and amount disbursed in various categories of loans, once again arguing that the shortfalls have contributed to the default. Thus he concentrates on the causes of *non wilful* default.

One cannot deny that these kinds of instances do occur in rural areas. However, for any attempt to examine the problem of overdues from within the existing system, among other things, it is essential to consider not only the perceptions of borrowers but also the perceptions of the bankers and other relevant issues.¹ The points that need to be raised here relate to the reasons for such

deviation from norms. The reasons might have been rooted in the day to day field problems of the bankers. The field problems may range from inadequate staff to structural problems leading to delays in loan disbursement and from political intervention to borrowers' attitude towards the formal credit agencies.

II

Kahlon has argued that defective practices have contributed to the problem of overdues. But to what period do the overdues refer to in the article belong? The question assumes importance because there has been a significant change in the nature of overdues during the 1980s. While many of the overdues of the early 1980s were on account of non wilful defaults (those in the late 1980s are essentially the result of wilful defaults). The level and growth of overdues amount held by wilful defaulters has rapidly increased during the period 1984-85 to 1988-89.² This statement is further corroborated by the evidence provided by the Khushro Committee's "Review of Agricultural Credit System in India". The committee, in order to ascertain the borrowers' perceptions of the causality of defaults, interviewed 1,013 defaulters across different types of credit agencies and the results are presented in the accompanying table. The table shows that crop failure due to adverse weather conditions and inadequate income generation from the activities for which loans are sanctioned are important reasons contributing to the problem of overdues. Only a small proportion of defaulters cited the defective lending policies such as very high repayment instalment amounts, unsuitable repayment schedules and high interest rates as the cause for overdues. The proportion of borrowers stating these factors as reasons for overdues are 0.9, 2.1 and 0.3 in CBs, RRBs, PACs and LDBs, respectively. The committee noted that "the largest percentage of respondents, i.e. 54.7 per cent defaulters to commercial banks, 54.4 per cent to PLDB and 52 per cent to PACs, did not indicate any specific reason which compelled them to default in repayment of dues to the credit agencies. This is, in fact, a *Don't know* category, some of these could be cases of wilful defaults". In fact, the change in the language of the bankers reflects this: they speak now not of repayment, but of recoveries, the latter term includes an element of coercion.

From the above it follows that the factors contributing to overdues have changed substantially. The defective loan policies and procedures of lending institutions might have contributed to the problem of overdues in the 1970s and the early 1980s. But the main factor contributing to the problem of overdues in the late 1980s is, we think, political intervention (both illegitimate and legitimate) in the functioning of the credit delivery system in the loan melas and also in the sanctioning of loans under government sponsored schemes, wherein the banker has been marginalised (totally and, perhaps, willingly). Legitimate political intervention refers to the loan waiver given by the National Front government when it implemented its election promise. It may be politically legitimate, in banking terms it is disastrous.

Another important factor contributing to overdues is the massive growth of the rural credit delivery system in the last 20 years leading to delays which are structural in nature in the sanctioning of loans. This is a managerial argument. For instance, bankers in western Orissa agreed with us that loans are delayed. This delay, they point out, is the result of a rapid increase in the number of borrowers and the absence of a corresponding increase in the staff, given the ban on recruitment. Even if they have staff, it would be difficult to ensure that loan instalments are disbursed in time. Consider a situation where 50 dug well loans are disbursed across the bank's catchment area. In several instances, the due dates of disbursement fall on the same day. The banker has to make pre-sanction visits to all the borrowers before sanctioning the next instalment. Because the borrowers are spread over a wide area, it is difficult to complete the pre-sanction visits within a short period. Hence the delays.

Let us assume that the defective policies of the lending institutions continue to exist. But these problems were unearthed in the early 1980s by the studies conducted by the National Bank which are referred to by Kahlon. Why did not NABARD act on its research findings? Why didn't it see to it that the defective policies of the lending institutions were changed? If indeed NABARD made such effort, then why did the banks ignore NABARD's instructions?

We know from our own field work that many of the nationalised banks have also conducted both studies and experiments on this subject and that they have an excellent understanding of both the problems they face and their own limitations. They have learnt from their experience. We are not sure whether this is the case with the NABARD which is a bureaucratic organisation. For instance, NABARD's idea in Bombay about the kind of data available with lead bank of

officers of the districts is far removed from the reality, as we saw in district after district. In this, there is a gap which is felt by the district/regional staff of NABARD itself. We had the exhilarating experience of NABARD's field officers telling us that the data their head offices wanted are simply not available.

Kahlon suggests that the problem of mounting overdues is the result of banks not following the NABARD's guidelines such as repayment schedule and grace period. Firstly, why is it that banks are not following the NABARD's guidelines? What do they gain by having massive overdues in their banks? We can turn around and ask: why should the banks follow NABARD's guidelines? We know of several guidelines/circulars of NABARD which were not very well thought out and on which NABARD kept on changing its mind and issuing fresh instructions. Certainly they are well intentioned. But these guidelines were formulated by officers in Bombay who often were devoid of any field level banking experience. The bankers, on the other hand, are operating at the field level and they know their problems and local realities, which include the borrower's ability to repay. Considering that many of the loans referred to by Kahlon went to those who are not the poorest, a reduction in repayment period or less-than the norm financing would not be critical. Such a reduction could even be justified on the grounds that the investor must have a stake in his investment if the loans were used for the stated purpose.

In fact, we argue that while the guidelines are necessary, they must be well thought out, tested and they should not be rigid in a large and diverse country like India. Bankers dealing with borrowers should have flexibility in deviating here and there from the guidelines. The fact of the matter is that the problem of overdues can partly be explained by strict adherence to the guidelines set up by the apex institutions regarding the amount to be given for a particular scheme and the inability of the apex institutions to make quick amendments in the guidelines based on field

realities. It makes good sense for the bankers to deviate from such guidelines when taking decisions in the field. This, after all, is the essence of a decentralised approach. The solution lies in dialogue and action research, but the system for this has to be set up. Here NABARD, as a promotional agency, may take the lead.

III

We get an impression from the article that the problem of overdues is the result of NABARD's guidelines not being followed by the lending institutions. In this case it must be noted that there is a serious problem of communication between the officers of the apex institutions and the banking institutions. The field reality is that the bankers (small and big) resist the supervisory superior role assumed by NABARD as an institution. As rightly expressed by Kanvande, the NABARD officials' "attitude towards both LBO and BMs [branch managers] should not be that of an overbearing superior but of a friend. Such an attitude will have to be carefully cultivated because it does not come naturally to those who work for apex institutions."⁴ The fact that, at a personal level, NABARD officials get along reasonably well with bankers does not change this basic position. Has NABARD ever tried to change its attitude if not why not? We are sure Kahlon, in discussing the problem within the existing system, would not deny the importance of this aspect in analysing the banks' attitudes to NABARD circulars.

The root of the problem seems to lie in the fact that, till 1982, such circulars had the authority of the Reserve Bank (of which NABARD as ARDC was a part) and were accepted by the banks as directions of the monetary authority. But after NABARD's independent set up in 1982, it is no longer part of the RBI, its officers do not wield the authority of a central bank and lack credibility on their own. Their organisation is seen as a routine refinancing agency. Its officers seem to have difficulty in accepting their new role as officers of a promotional

developmental organisation rather than a regulatory one. This is true of NABARD as a whole as well. To the officers of the commercial banks, NABARD officers are arm chair theorists who arrogate to themselves the power to give meaningless directions, and this is resisted. We regret the strong language, but this is our field observation.

This needs to be changed, and we would like to offer our own suggestion, once again within the framework of the existing system, here. The ACRC (Khusro Committee) has suggested that RRBs be merged with their sponsor banks. Instead, the equity of the sponsor banks—if it has not been eaten up—can be transferred to NABARD, and it should take up the responsibility of managing them. This will give NABARD officials a base in the field and an opportunity to show how rural credit institutions should be run. They can then take up the responsibility for implementing the Service Area Approach and show what can be done with the Potential Linked Plans. NABARD has taken the important step of posting its officers to districts as District Development Managers. These DDMs could also function as the general managers of the local RRB. They can show how linkages can be provided and the quality of credit raised to the required level. After that there will be no credibility problem. They can lead by example, not through circulars, and bankers will willingly follow.

Notes

[We thank Vinod Vyisulu and V. M. Rao for their comments on an earlier draft of this note. We would like to reiterate that these are our personal views.]

1 This we have attempted to get by interviewing borrowers and bankers in 10 districts across five states in the last 18 months or so in a project sponsored by NABARD. We would like to comment on Kahlon's points on the basis of our own field work in several major states on the factors influencing overdue—but we cannot present the data here as we need the written permission of NABARD for publication and this we do not have. But see, for example, D. Rajasekhar and Vinod Vyisulu, 'The Rural Credit Delivery System: A Study in Pali District of Rajasthan', *EPW Review of Agriculture*, September 24, 1990.

2 Based on the data on distribution of overdues amount by status of defaulters collected from about 300 bank branches (belonging to four types of credit agencies viz. CBs, RRBs, PACS and IDBs) spread over 10 districts in five states. However, we are unable to provide this information without the written permission which we do not have. Interested readers are referred to the Report on 'Strengthening the Credit Delivery System' submitted to the general manager, FAPD, NABARD, Bombay, in March 1991.

3 Khusro Committee's report, p. 552.

Reaching a new high

At Colour-Chem, this is a credo. It keeps us trying harder seeking greater heights to conquer.

That's how we've more than doubled our exports in the last four years, reaching a new high of Rs 1675 lakhs in 1989-90. An export performance based primarily on indigenous value addition - in order to maximise net foreign exchange earnings for the country.

Today we are a recognized Export House with Star Exporter status. We export organic pigments, dyes and intermediates to the most sophisticated markets in the world — U.S.A., West Germany, U.K. and the Far East. More than 96% of our exports go to General Currency Areas.

Our quest for excellence has also won us awards - eighteen in two decades.

The quest continues.

65% of our production has been tied up for exports!

Akhil Ceramics Ltd starts out as a winner. It has already tied up 65% of its production for exports under a buy back arrangement with Mori s p a. The foreign collaborators have participated in the Company's equity as well.

Akhil Ceramics' Rs 13.30 crore, 13,000 TPA ceramic tile project near Tirupathi in Andhra Pradesh employs the **Dry Grinding Technology**. This has resulted in a capital cost of Rs 10,000 per installed tonne — among the lowest in the industry. And substantially lower production costs on account of reduced fuel consumption. All leading to high profitability.

To ensure that its products conform to the highest international standard, Akhil Ceramics has procured its major plant and machinery from Mori s p a of Italy.

The project is in an advanced stage of implementation. And with production expected to commence in October, 1991, Akhil Ceramics is poised for a future of growth and prosperity.

Economic Policy Debate

What are the sources of increased efficiency and production in the New Industrial Policy and how does it propose to further the social objectives of promotion of small industry, fostering of regional balance and curbing of concentration? **1869**

An alliance is being forged between foreign capital, enjoying the backing of administrative and political authorities in the respective countries of origin, and comprador business interests enjoying administrative and political patronage in India. This is the deadly alliance which will drag India into neo-colonial dependence **1837**

It is true that India is getting close to the debt trap and indeed we may catch the Latin American disease. However, it is not the policies of the last five-six years that has brought this about but the development strategy of the last four decades **1850**

Hundred Years After

While the 1891 Age of Consent Act ensured legal protection for girl-brides and the related controversy introduced a more humane perspective on their condition, its fall-out was that the cause of women's emancipation was relegated to the background over the next few decades **1857**

Urban Dilemmas

The lack of infrastructure, particularly communication, the absence of a planning and implementation process and the dearth of a coherent, realistic development policy are at the root of the many problems which plague Calcutta: as for instance unauthorised construction and building collapses **1844**

But can a development policy which legitimises control over urban land use by vested interests, as the newly published Development Control Regulations does for Bombay, make life more comfortable for the urban masses? **1840**

Caste Shadow

Janardhan Reddy's new cabinet in Andhra Pradesh is only more of the old—the upper caste is more numerous and more visible **1839**

Building Consensus

The need of the hour is to build a consensus between Moscow and the republics and rewrite the national contract. Even the Baltic states need the Russian market to buy and sell and cannot survive outside or without Russia **1846**

Inefficient but Vital

Mindless interference in disbursements under the priority sector lending programmes has certainly to be acknowledged and countered. But it cannot be used as an excuse for faulting the very rationale of the programme **1833**

Muffled Voices

Slavery has an ideology of a kind. And before long Indians will discover that 'dasas' are never heard, if they have not already noticed the decreasing resonance of the Indian voice in international politics and economics **1834**

Purposeless Debate

What will be the effects of the different options being proposed for the change in the roles of the public and private sector? What are the possibilities of the private sector substituting the public sector in the economy? **1873**

Distant Dreams

Rajasthan's Indira Gandhi Canal has hardly fulfilled the hopes it generated—at least not for the region's poor **1842**

Hegemonised!

MY unease about the editorial policy of *EPW* has been growing over the past few years but I have put off writing about this, if only out of editorial fellow feeling! But I have criticised *EPW* elsewhere (in a forthcoming issue of *Manushi*) so the time has come to speak out in *EPW* itself.

LPW (then *The Economic Weekly*) was established by Sachin Chaudhuri, whom I knew well. He was quintessentially liberal, and the journal achieved its unique standing for that reason, besides his varied intellectual gifts. But it has in recent years been hegemonised (to use one of their favourite words) by a group of Marxists (I am not sure of the exact category). They have tried to convert it into a party journal, restricting debate to doctrinal strife amongst the faithful, appropriating the goodwill (and money) built up by Chaudhuri and his friends and supporters for very different purposes. This take over was easy because Indian liberals (including those on your board of trustees) are a supine lot.

Our apathy has been particularly dangerous in this case because *EPW* still has a unique position amongst intellectuals and policy makers not only in India but also abroad. Its influence has in fact been diminishing because of the staleness, repetitiveness and predictability of the party line bore readers—a very large number of people I know only read the special articles. Then why bother to protest? First because *EPW* still monopolises an important public space and building up a rival will be costly. Secondly, because many readers are not aware of the constant censorship of articles that are not considered ideologically correct, with exceptions such as myself. (Some radical readers I find, take it for granted that such censorship is desirable—but then they should found a journal themselves with an openly avowed editorial policy.)

To be specific, this partiality manifests itself in your choice of articles, the speed with which you publish articles and the space you give contributors. Let me make it clear that I feel editors have the right to determine such matters, but the principles on which they take such actions should be clear to their readers. I am objecting not to your taking decisions any editor should take, but to the editorial policy being under cover. If I am wrong about this question of time of publication you have a simple remedy—just publish the date of receipt of every special article

you publish. (And incidentally, why not publish the date of publication of each *EPW* issue correctly—the present incorrect system of dating is going to confuse future readers; indeed it confuses some present ones.)

To go back to the issue of partiality, I have also heard complaints that letters by critics of *EPW* favourites are doctored without their permission, which again misleads readers.

In conclusion, I should stress two points. First, these misgivings are very widely held, and indeed have a pre-censorship effect—many excellent scholars do not send papers to *LPW* fearing biased selection (a loss to them as well as your readers). Secondly, I have no personal animus. On the contrary, I have always been treated with courtesy and fairness. I write as a supporter of *EPW* from its inception, and as a genuine well-wisher.

DHARMA KUMAR

New Delhi

[The range of themes and writers actually figuring in our pages and not subjective impressions, nostalgia or hearsay should be the test of whether there is censorship of articles that are not considered ideologically correct and debate is restricted to doctrinal strife amongst the faithful. Such concrete scrutiny by concerned readers we welcome and hope to profit by. Unconnected with doctrinal considerations, there do occur delays and other lapses including in dealing with material submitted for publication. While

these are, in part at least, the outcome of the circumstances in which the *EPW* is produced, Dharma Kumar's letter has, for us, underscored the need to pull up our socks and for that we are thankful — Ed]

Private Sector in Health Care

NEARLY 80 per cent of health care is provided by the private sector and it is fast expanding. Closer scrutiny reveals that it is, often, inappropriate in its nature, skewed in its distribution, expensive in its manifestation and largely unregulated in practice. The present climate of 'marketisation' and 'privatisation' is likely to adversely tilt the situation further. This warrants a thorough debate on the subject. With this in mind, the medico friend circle has chosen the above mentioned theme for its annual meet, scheduled to be held in Bombay, at Vinayalaya (Retreat House), behind Holy Family School, Mahakali Road, Andheri (East), Bombay 400 093, on September 5 and 6 1991. This will be followed by a public meeting on the subject at Chhabildas Sabagrih on September 7.

Those interested in participating, please write to the convenor, Medico Friend Circle, Organisational Office 34 B, Noshir Bharucha Road, Bombay 400 007.

Search for Identity

THOUGH the renewed schism in the Janata Dal remains unresolved, for the present visible signs of tumult in the party have subsided. Even so prognostications of an imminent split in the party, though seemingly premature, cannot be entirely discounted for there is more than a trace of residual tension in the newly launched public campaign of the rival factions. This resurgence of factional manoeuvring in a party that is at best only spasmodically united appears to be part of a process of defining its political identity—something that has not been clearly established either at its birth or at any other time thereafter—in the light of the realities revealed by the recent elections.

Initially the Jan Morcha group with a predominantly urban appeal comprised its core and performed a directive role in cobbling together a formation whose principal constituents represented forces on the ascendant in the countryside. The delicately balanced tensions that afflicted the National Front government were expressions of this original contradiction. Devi Lal's offensive at the head of a supposedly rural lobby was periodically neutralised by the manipulations of the Jan Morcha. The notification for implementation of the Mandal Commission's recommendations undermined the Jan Morcha by alienating urban middle class opinion and Devi Lal by fracturing his so called rural lobby and the Janata Dal increasingly identified itself as an OBC and minorities' party as an election gambit.

The current conflict in the party is a fall out of the persistent opposition to this OBC identity by the non-OBC element in the party. The overwhelming dominance of the OBC lobby in the party led by the Bihar group has generated an understandable anxiety in the likes of Ajit Singh who have a significant stake in north Indian mass politics. The developments in Uttar Pradesh have to a large extent shaped the latest round of differences between Ajit Singh and V P Singh. The departure of the bulk of the Mandal segment of the UP unit of the party to the BJP on Mulayam Singh Yadav's initiative on the occasion of the first split left the field clear for Ajit Singh to take control of the state unit. The party's election strategy in the state was by and large directed by him and as a

consequence of its poor performance he has been sidelined within the party.

However, the possibilities raised by the simultaneous eclipse of the BJP which laid to rest the aspirations of his rival Devi Lal to Jat leadership could not have escaped him altogether. Yet his potential to exploit the defeat of his rival and emerge as leader of a strong Jat lobby is severely restricted by the narrow OBC orientation of his party.

It is entirely in keeping with the platitudes that announced the birth of the Janata Dal and those that have serenaded the party through every crisis that Ajit Singh should adopt a high moral tone to air his grievances. His public criticisms of the party relate to its organisational weakness, its functioning through a coterie, the failure of party president S R Bommai's leadership in the election and so on. And in a simultaneous move to displace Mandal as the party's sole focus he held out threats to revive the now defunct front organisation of the erstwhile Lok Dal(A), the Kissan Kaugar Sammelan, in an attempt to revert the ground to a community of farm interests. A drift in this direction can prove beneficial to the party in the long run but how far he succeeds will depend on his capacity to utilise opportunities that present themselves.

In this context the budgetary proposal to withdraw the subsidy on fertilisers is opportune. But not one to be outmanoeuvred easily. V P Singh has announced a nation wide agitation against the anti farmer policies of the government in a move to pre-empt Ajit Singh's consolidation of an agricultural vote bank. This is in addition to the agitations proposed to be launched on both the Babri Masjid and the Mandal issues. The idea evidently is to link these issues to revive once again the coalition whose core was conceived of by Charan Singh and which was substantially expanded by the Janata Dal in 1989. If V P Singh succeeds in this venture Ajit Singh could still have a prominent role to play in the reformed coalition. If on the other hand V P Singh fails, the Janata Dal will have little option but to return to its OBC moorings, in turn leaving Ajit Singh no choice but to make his exit from the party.

FOREIGN REMITTANCES Third Dimension

FINANCE minister, Manmohan Singh, has himself singled out the balance of payments situation as the most difficult of the country's current problems. He has described it as precarious and the resultant foreign exchange crisis as constituting "a serious threat to the sustainability of growth processes and orderly implementation of our development programmes".

It is in this context that one can appreciate the thrust of his various budget proposals and announcements, be they on liberalisation of policy on direct foreign investment, on facilitating NRI investments or on foreign exchange inflows in general, including receipts by resident Indians. The last item refers to the two new schemes announced with a view to attracting additional foreign exchange inflows, one in the form of SBI dollar bonds to be made available for purchases by NRIs and "their overseas corporate bodies" and the second of tax exempt gifts in foreign exchange received by resident Indians. Even the bonds purchased under the first scheme can be gifted to resident Indians. In either case of gifts thus received by resident Indians, immunity and amnesty in respect of the provisions of direct tax laws and exchange control regulations are promised.

Basically, what both schemes seek to do is to attract back home funds which resident Indians have accumulated abroad with a promise that no question will be asked about their source nor will any tax be levied. If in spite of the promise of amnesty and immunity people would rather route their foreign holdings through a third party abroad, they can do so through the SBI dollar bonds. Otherwise, they can get them back directly under the second scheme. In the case of remittances received directly, the advantage to the recipient is that he/she can deploy the rupee equivalent straightaway, whereas he/she will have to wait for the SBI bonds to mature, that is, for a five year period. Of course, during the period of this waiting no tax will be leviable.

Some doubts have been raised about the implications of the finance minister's statement that "the provisions of direct tax laws will apply in the normal manner to the rupee proceeds of these remittances." Does it mean that the tax authorities can raise questions and demand tax on the rupee proceeds? Or does it only mean that on deployment of these proceeds for whatever purpose, be it bank deposits or business investment or for any other purpose, they will be treated as any other local proceeds? It is to be hoped that these doubts will be taken care of when the details of the two schemes are worked out and announced.

Will the two schemes prove to be attractive enough? Perhaps, going by the way the hawala rates have gone up even after the

upvaluation of the rupee. Normally, the gap between the official exchange rate and the hawala rate should have narrowed down. Could it be that black money within the country is trying to move out in order to come back in the form of tax exempt remittances under one or the other of the two schemes? Of course, the government has also announced an amnesty for local black money, but that is to attract an impost of 40 per cent, whereas remittances from abroad are not to attract any tax. Therefore as long as the hawala rate premium on foreign exchange is lower than 40 per cent, it pays to move black money out and bring it back as remittance. But if this is the logic of the hawala market's current behaviour, then perhaps the foreign exchange inflows under the two schemes may well be substantial.

STATE FINANCES Axe on Statutory Transfers

THE finance minister has made a categorical statement in his budget speech that "in preparing this budget I have sought to ensure that the burden of fiscal adjustment does not fall on state governments." But has he really been true to his word?

Well, while he has allowed "a modest increase" of Rs 821 crore in the central plan outlay, it has to be conceded that his budget does not, at the same time, envisage any cut in the level of central plan assistance as was proposed in the interim budget. Should not the states be grateful for this mercy? Perhaps they are, particularly in the light of the reduction in the share of statutory transfers (i.e., share of taxes plus grants recommended by the Finance Commission) in the total resource transfer from the centre to the states. The share of these statutory transfers has declined from 52.1 per cent in the 1990-91 budget estimates and 47.4 per cent in the 1990-91 revised estimates to 45.1 per cent in the 1991-92 budget estimates.

That this has happened could not be unknown to the finance minister. In fact, the decline in the share of statutory transfers in the total resource transfers to the states is the consequence very largely of the way he has gone about raising additional tax revenues. The one source of central tax revenues that the states are eligible for the highest proportion of (85 per cent), namely, income tax, the finance minister forswore altogether. Even the 40 per cent special levy on black money deposited with the National Housing Bank is "to form the corpus of a fund" with the bank itself "to be utilised for financing slum clearance and low cost housing for the poor, in accordance with guidelines and priorities laid down by the government." The finance minister altogether forgets that 85 per cent of the levy rightly and properly belongs to the states,

representing as it does the balance of their income tax.

That the finance minister has also been purposefully selective in the choice of sources to be tapped for raising additional tax revenue is borne out by his actual proposals, particularly on the side of direct taxes where he has concentrated practically exclusively on the corporate tax. On the side of indirect taxation, he has no doubt taken care to see that he taps those sources whose proceeds can be equitably shared with the states. Thus of the additional net revenue from excise, including that from the 100 per cent enhancement in the special excise duty, the states are supposed to get as much as 50 per cent. (It is not clear though how this calculation has been made because the states are entitled to a maximum of 45 per cent of the excise revenue, perhaps the finance minister is including in his calculation the additional yield from excise on sugar which is really in lieu of the states' own sales tax.) Overall, however, while the centre expects to net for itself as much as Rs 2,005 crore, the additional statutory transfers on this account to the states would work out to only Rs 612 crore, i.e., a mere 23 per cent of the total additional revenue.

Will the states not be entitled to a conclusion of their own about the finance minister's stated concern for their finances?

CONGRESS(I) Regional Leaders to the Fore

BJP leader L. K. Advani recently suggested that the days of anti-Congressism are over. Perhaps in the light of recent events he may need to clarify precisely which Congress he meant. As if to confirm that there exists a Congress which is unwilling to regard the proposition in a spirit of reciprocity, the minister for civil aviation and tourism, Madhavrao Scindia, launched an attack on the BJP, referring to the party, without naming it, as anti-national. The allegation was reiterated in a subsequent parliamentary clarification. Perhaps the minister's real motives are quite far removed from the lofty principles that have been evoked, but judging from the response that has been elicited he is no doubt satisfied that his purpose has been served.

The BJP's shrill reaction is aimed as much at setting the record straight as at embarrassing the Congress(I). Following Scindia's clarification in parliament, the BJP's demand is that the government should explicitly distance itself from his remarks, knowing fully well that it is in no position to comply. The Congress which has laid claim to be the sole provider of stability cannot be seen to be chastising its own members at the behest of opposition parties. Moreover, any move in this direction can only aggravate existing divisions in the party.

For the moment, the BJP has decided to boycott parliamentary proceedings till the Congress party repudiates Scindia's statement. However, this impasse is likely to be broken soon since the arithmetic of the deputy speaker's election will require both parties to co-operate. But this does not in any way ease the Congress(I)'s position, since the party, though organisationally derelict, has itself become an arena of conflict.

The massive majority in 1984 enabled Rajiv Gandhi to treat the party merely as a label and to promote a coterie of non-entities, thereby compelling regional leaders to lie low. The defeat of 1989 initiated a new process with state leaders like Sharad Pawar, who commanded a reasonable mass base, staying afloat by engaging in subterranean dissidence against the high command. With Rajiv Gandhi's departure, mutations are under way in the Congress and the government's lack of independent status has created conditions for those with leadership aspirations to stake their claims. Scindia's move is quite obviously an attempt to create a distinct constituency for himself and this is of a piece with the activities of other state leaders. Since the erstwhile coterie has no figurehead to satellite around, it too has embarked on a similar enterprise.

In Karnataka Bangarappa, elevated to chief ministership by the old high command, has found the state's long-standing dispute with Tamil Nadu on the sharing of the Cauvery waters a convenient plank to carve out a niche for himself. Since this has jeopardised the party's relationship with its electoral ally, the AIADMK, the central leadership to the extent that one exists, is not above using his detractors in the state to mount a campaign on the telephone-tapping scandal. Bangarappa's stand has come in handy for TNCC(I) president Vazhapadi Ramamurthy to secure his position vis-à-vis his state party rival K. Moopanar, in the process allying himself more closely with the AIADMK. Of the coterie, Sitaram Kesri has taken a stand in favour of reservations for the other backward castes, violating the official silence that the party has found politic to maintain. Jagannath Mishra, too, for reasons relating to Bihar politics, has followed suit.

Scindia's campaign bases itself on the resentment in a section of the Congress parliamentary party to the emerging co-operation between the Congress and the BJP. Given the BJP's strength in Madhya Pradesh, closeness between the two parties can only be to the detriment of Congress leaders from the state. His anti-BJP tirade has also given him a head start over his rival from the state, Arjun Singh, who sought to retrieve the situation by compelling Scindia to clarify his position in parliament without perhaps expecting the latter to repeat his statement. That Scindia's move has paid off

for him is clear from the Congress(I)'s inability to dissociate itself from his remark. This apart, he has managed to garner substantial support within the CPP leading to misgivings of the likelihood of a 'conscience vote' in the deputy speaker's election. Scindia evidently has his eye on the other opposition parties as well. But how far Scindia can sustain his advantage remains to be seen. With January next being the deadline for organisational elections in the Congress(I), further developments of the same genre can be expected.

SMALL SAVINGS What about BBB?

WHILE presenting the interim budget, the then finance minister Yashwant Sinha, it will be recalled, made a very interesting observation while explaining why the fiscal deficit for 1990-91 was as high as 8.59 per cent of GDP. The observation was as follows: "The increase in the fiscal deficit is to some extent beyond the control of the government due to the autonomous buoyancy in small savings collection—a result of which the provision for loan to state governments against small savings collections has gone up by Rs 2,270 crore in the revised estimates. Were it not for this factor the fiscal deficit now estimated at 8.59 per cent of GDP would have been 8.11 per cent of GDP." Later in the same budget speech, Yashwant Sinha's list of measures to reduce the fiscal deficit included a reduction in the provision for loans to states on account of their share of small savings from Rs 6,770 crore in 1990-91 (RE) to Rs 4,500 crore. He was effecting this reduction on the grounds that the National Savings Scheme was proposed to be transferred to the Bharat Bachat Bank to be set up soon.

In the regular budget for 1991-92 just presented to parliament, there is no mention whatsoever of the proposed Bharat Bachat Bank. Unlike the interim budget which took credit for only Rs 6,000 crore as net collection from small savings as against the 1990-91 (RE) figure of Rs 8,000 crore, the regular budget takes credit for the full Rs 8,000 crore. There is not a word of explanation in the budget speech of the new finance minister why the government has dropped the idea of setting up a separate bank to be called Bharat Bachat Bank, nor is there any word about the resultant increase in the fiscal deficit.

Although Yashwant Sinha's proposal to transfer the National Savings Scheme to the proposed new bank did not go the full distance in meeting the problem he himself had posed, namely that higher small savings collection necessitated larger transfers to the states and consequently a larger fiscal deficit, he did make a serious attempt in that direction by excluding a part at least of the

small savings from the purview of the union budget. The new finance minister, if he had wanted, could have gone the whole hog and excluded small savings altogether from the purview of his budget. Instead he chose to reverse the budgetary reform initiated by his predecessor and in the process set himself a higher target in terms of reduction in the fiscal deficit, a target that the government is committed to reaching this year in its current negotiations with the IMF. (Whatever else in regard to the government's commitments to the IMF may have been kept out of public knowledge that this particular commitment has been made is no longer being denied. Indeed the finance minister has conceded as much in parliament.)

True, the state governments were extremely worried about the reduction in the interim budget in the provision for transfer to them of their share of small savings collections. But that was natural. The government chose not to be explicit about the sharing of collections under the National Savings Scheme. The new finance minister could have been explicit on this matter. But why did he decide not to pursue the idea of the Bharat Bachat Bank and adding thereby the budget of the impact of ups and downs in small savings collections? Did the IMF intervene and refuse to accept the consequential reduction in the budgetary outgo as a fiscal adjustment measure? Perhaps.

FOREIGN INVESTMENT Doubts about NRIs

INTERESTINGLY, in his budget speech, finance minister Manmohan Singh makes no reference whatsoever to NRIs when he speaks of the decision "to liberalise the policy regime for direct foreign investment". When he does speak of the NRIs and their investments in ventures in India, he does so in a totally different context. Thus he speaks of "investment on a non-repatriable basis". To quote: "A comprehensive review of policies and procedures bearing on non-resident Indian investments shall be carried out and further relaxation made in order to remove all procedural difficulties and impediments to the setting up of industrial and other ventures by non-resident Indians. New sectors shall be made available to NRIs for investment on a non-repatriable basis, including housing infrastructure and real estate development."

Of course, Manmohan Singh has made fully known his scepticism with regard to the inflow of NRI funds, in and out of parliament. But is it that in the new liberalised policy regime with regard to direct foreign investment a distinction is on the anvil between NRI and other investors from overseas? To a pointed question on whether or not someone like Swraj Paul, the UK-based NRI who at one time very nearly

succeeded in taking over one or two major Indian companies, Escorts and DCM, would now be welcome with his foreign funds, Manmohan Singh was rather guarded and qualified his response by drawing a distinction between establishing a new firm and taking over an existing firm. Will that distinction be kept in mind in regard to other investments from overseas? What if a foreign company wishes to increase its stake in an Indian company from the present 40 per cent or below to 51 per cent? Will that not amount to a take over of sorts?

These are questions answers to which cannot be evaded, not for long anyway. Not because of any so-called nationalistic concern for the NRIs vis à vis other overseas investors but because, whether one likes it or not, and Manmohan Singh's scepticism notwithstanding, NRIs may well be still the only ones who may show any major interest in making investments in India in substantial amounts, at least in the immediate future. And they would have to be assured that they would get at least the same treatment as other overseas investors, be it in regard to control, repatriation of funds or what have you. Also, from the point of view of the immediate need of the country for foreign exchange, is it not important that doubts and suspicions in this regard are cleared at the earliest? On repatriation of funds for instance, it is one thing for a company voluntarily to reinvest its profits here, quite another to be asked compulsorily to do so.

NICARAGUA

Revolution Imperilled

THE first congress of the Sandinista National Liberation Front (FSLN) last month was to determine not just the future programme of the front but also the future of the revolution in Nicaragua. The front's poor performance in the elections in February last has given rise to a series of internal debates, at least some of which are indicative of the existence of long standing differences over policies within the front. That these were never acknowledged and given room for development within the party is a major critique of the front which will undoubtedly prompt rethinking on such issues as the role of democratic debate in a revolutionary party especially one holding power in a besieged country. On the other hand that such critical and polemical debate should develop at all now is indicative of the essential vitality of the party, which in government made some very important gains for the people. It is these gains which are being reversed today, disturbingly, with the consent of the FSLN leadership.

Since its election victory, the Chamorro-led government of the National Union of the Opposition (UNO) has gone about systematically dismantling the social structures of

a revolutionary state. The first issue which came up was the role of the Sandinista People's Army (EPS) which numbered 90,000 in February 1990 and had been reduced to 28,000 by the end of the year. This demobilisation of the army and disarming of civilians were effected following an agreement with the FSLN by which Huberto Ortega was allowed to retain command of the EPS while giving up his functions in the leadership of the front. But the inherent contradiction of a revolutionary people's army being under the orders of a government set upon dismantling the revolution became clear in July 1990 at the time of the general strike organised under the National Workers' Front protesting against the Chamorro government's attempts to privatise industries and retrench workers. While the army refused to clash with the workers, it nevertheless cleared daily the barricades which were every night rebuilt by the workers, often with help from soldiers in civilian dress.

Following this came the October agreement between the FSLN and the government, which an emerging left section within the front, grouped around Tomas Borge alleged gave too many concessions. According to the agreement "The government in privatising the state enterprises takes into account the rights gained by the workers such as their right to participate in the ownership of the enterprises [it] will authorise the functioning of private financial institutions, [it] will concede export licences to associations of producers and to private individuals." Thus three major gains of the revolution, the area of people's property (APP), the nationalisation of the financial and credit systems and the state monopoly of foreign trade were put in jeopardy. Significantly, the October accord was in line with the official FSLN standpoint released at the Sandinista Assembly at El Crucero in June 1990 following the election defeat of the front. This text had omitted to list either the nationalised sector or the arming of the masses as the inviolable gains of the revolution.

It is not only the gains of the revolution which are in jeopardy today but the very ethos of a revolutionary party which had made international solidarity its centre piece. In December 1990, the United States with the active co-operation of the Soviet Union showed that missiles supplied to the EPS by the Soviet Union in 1986 had been smuggled across to the Salvadoran Farabundo Marti National Liberation Front (FMLN) the previous month to counter US gifted helicopter attacks on unarmed populations by the Salvadoran army. The FSLN not only acceded to the imprisonment of four officers on the charge of illegally transferring the missiles, but also to the FMLN being forced to return the arms. This was seen by a section of the Sandinista militants as a betrayal of the international movement.

TWENTY YEARS AGO

EPW, Special Number, July 1971

The government's latest *Economic Survey* concludes its chapter on 'the tasks ahead' with the statement that while the economic problems facing the country "add up to a formidable fare [the] economy is now better poised to tackle them than at any other time in recent years". The claim does not seem wholly unjustified by reference to some of the accepted indices of the state of the economy. For the second successive year the growth of national income at constant prices exceeded 5 per cent in 1970-71. There is another side to the economic picture, however. That the 5 per cent rise in national income was the result essentially of growth of agricultural production is well recognised. But within the agricultural sector itself performance was far from even. By and large it remains true that the impact of the so called 'green revolution' is still limited to wheat which accounts for just about 15 per cent of the total area under foodgrains. In industry, even accepting the most optimistic assessment of the performance of the small scale sector, it remains a fact that the recovery from the industrial recession has been unexpectedly slow and painful. Some of the large investment proposals which are surfacing now, and which account for a good part of the alleged 30 per cent increase in investment in organised private industry, are those which were mooted some years ago but were held up on account of the political uncertainties of the last two years. There is, therefore, no knowing whether the momentum will be maintained especially in the context of sluggish public sector investment. As for the rise in the level of investment in the economy, this has been achieved, let it be remembered against the background of deficit financing to the tune of Rs 365 crore in 1970-71. This year the deficit is expected to go up to Rs 600 crore—taking the total for the first three years of the Plan to over Rs 1,000 crore against the total provision of Rs 850 crore for the entire five year period. The alarms on the price front have been loud enough and even the stability in the case of foodgrains has been made possible only by cheap food imports. But nowhere is the limited impact of planned development so manifest as in the generation of additional employment. It has been estimated that the total increase in employment in the organised sector of the economy, covering all public sector undertakings and non-agricultural establishments in the private sector employing 10 or more workers, over the five year period from 1966 to 1970 was a mere 5 per cent, or less than 1 per cent annually. In other words, the total planned development effort has made not even a scratch on the employment problem.

Profits under Squeeze

HINDALCO INDUSTRIES, one of the largest manufacturers of aluminium, achieved an increase of 11 per cent in turn over during the year ended March 1991. Production of the metal improved from 1,30,787 tonnes to 1,39,762 tonnes. Capacity utilisation increased from 87 per cent in 1989-90 to 93 per cent. Production of rolled products and extruded products remained lower at 27,762 tonnes and 8,652 tonnes respectively compared to 28,787 tonnes and 10,000 tonnes respectively in the previous year. There was an improvement in the production of conductor redraw rods from 32,962 tonnes to 33,436 tonnes. The market for aluminium remained depressed despite price stability and adequate supplies. The non allocation of adequate funds to energy, transportation and other sectors and increase in the central excise duty stunted the expected

normal growth in consumption of aluminium rolled products and extrusions.

The value of production increased sharply by 12 per cent from Rs 467 crore to Rs 521 crore. Consumption of raw material which formed 34 per cent of value of production showed an increase of 19 per cent. Similarly, cost of power and fuel which formed 26 per cent of the value of production went up by 8 per cent. Operating profits improved by 23 per cent but gross profits (profits before tax and depreciation) showed a growth of only 12 per cent and profits before tax rose by only 8 per cent. Despite a 111 per cent increase in tax saving investments such as units of the UTI and other bonds the tax provision went up by 24 per cent. This resulted in a growth of only 0.6 per cent in profits after tax. The company paid dividend at the rate of 30 per cent on share

capital of Rs 32.39 crore including the bonus issue of Rs 14.54 crore. As a result of the partial conversion of debentures, the equity capital increased by Rs 6.38 crore and reserves and surplus by Rs 63.81 crore. The company paid a dividend of 15 per cent on equity shares arising out of conversion of debentures.

As a result of the increase in equity capital and reserves and surplus, the debt-equity ratio was lower at 0.62:1 compared to 0.90:1 in 1989-90. The increase in operating profits resulted in improvement in the interest cover from 3.24 to 4.16. The faster rise in investment than sales resulted in a lower turnover ratio at 0.82:1 than 0.93:1 in the previous year. The return on investment also climbed down to 18.64 per cent from 20.93 per cent. The net return on shareholders' funds also showed a decline.

Total flow of funds during 1990-91 amounted to Rs 159.32 crore. Internal sources, especially reserves and surplus and depreciation, accounted for the major chunk. This was utilised mainly for investments and increase in fixed assets.

Installed aluminium production capacity was increased to 1.5 lakh tonnes during 1990-91. The company proposes to enhance the smelting capacity by 1.5 lakh tonnes. The company installed micro-processor based controls in five potlines towards energy conservation. Similarly, installation of continuous strip caster made possible energy conservation and enlarged product mix. Work pertaining to another cold rolling mill is under way. The company is further pursuing clearances for setting up a one million tonnes steel plant for manufacture of hot rolled products and 5,000 tonnes per annum capacity aluminium foil plant.

The company entered the international aluminium market during 1988-89 and built up a sizeable market in south east Asia, west Asia, Germany, etc. Semi-fabricated products introduced in the West European markets enabled the company to more than treble export earnings from Rs 3.73 crore to Rs 12.10 crore in 1990-91. As against this foreign exchange used was Rs 18.74 crore. However the company fears the proposed withdrawal of CCS will have a dampening effect on exports, and on the industry in general.

ASEA BROWN BOVERI

Technology Upgradation

ASEA BROWN BOVERI (ABB) which completed a full year after amalgamation with Asea, showed an increase of 11 per cent in net sales on an annualised basis.

The increases in profits before tax and net profits has been very impressive. Profits before tax and after tax rose by 88 per cent and 59 per cent, respectively, despite increase in cost of inputs as well as hike in labour costs. Profits would have been higher but for the delay in the realisation of payments from state electricity boards resulting in avoidable interest burden. The company earned foreign exchange to the tune of Rs 14.68 crore while it used Rs 26.37 crore for import of raw materials, etc. According to the company, the order backlog at the end of December 1990 stood at a lower level of Rs 230.6 crore compared to the 1989-end figure of Rs 280 crore. Reportedly, there was an improvement in the situation in the first three months of 1991.

The company continued modernisation and technology upgradation at its different facilities for widening its product range as well as improving cost effectiveness. New products such as SF6 circuit breakers, electronic telephone exchange for power line carrier application, small telemetering type STM-13, EPABX for telex switching, software for autonomous wind diesel systems, 2500 KW medium frequency stake convertor, etc, were developed.

The turnover ratio improved from 0.74:1 to 1.00:1. Return on investment and shareholders' fund also showed improvement. Gross return on total capital employed works out higher at 7.66 as compared to 3.72 in the previous year while return on net worth almost doubled from 8.19 per cent to 15.76 per cent.

There was a fund flow of Rs 20.46 crore in 1990, financed mainly by trade dues. This was utilised mainly for financing sundry debtors.

LLOYD STEEL

High Value Contracts

LLOYD STEEL increases its turnover and net profits by 34 per cent and 39 per cent respectively by taking up high value sophisticated contracts and turnkey projects despite the inflationary spiral and stiff competition during the year ended March 1991. According to the company, the continuous increase in operations and profitability was mainly due to providing technologically advanced and composite package of various services such as design, fabrication, erection and commissioning of sophisticated and import substitute equipment.

Operating expenses increased substantially during the year under review. The company had to import 57 per cent of raw materials and 69 per cent of stores and components consumed during the year under review as against 46 per cent and

45 per cent in the previous year. There was an increase of 16 per cent in the value of imported raw materials and 101 per cent in the value of imported components and spares. Besides, employees cost went up by 13 per cent and sub-contractors' charges under other expenses were enhanced by 262 per cent. Despite these spurts, the company was able to reduce the expenses to sales ratio from 1.17:1 to 1.01:1 in 1990-91. There was an increase of Rs 45 lakh in net profits.

The foreign exchange crisis caused con-

siderable delay in prospective orders. This affected the order book position of the company. The devaluation of the rupee would make import of materials dearer and affect profitability. The company made no export earning other than deemed export billing which came to Rs 2.34 crore during 1990-91.

During the year under review, the company made capital expenditure of about Rs 5.55 crore for expansion and modernisation. The company has four major

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues, have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

Lopsided Growth

Political Economy of Indian Development

by Pradhan H Prasad

This collection of essays in political economy unravels the forces which have acted as a drag on Indian development. The Achilles' heel of Indian development plans, the author argues, has been their preoccupation with investment planning to the neglect of institutional transformation. Within this broad framework the author discusses a wide range of subjects including macro-economic plan models, choice of techniques, the persistence of outmoded production relations in agriculture, growing political assertion by the middle peasantry, roots of agrarian violence and uneven regional growth.

OXFORD UNIVERSITY PRESS

Bombay Delhi Calcutta Madras

project sites equipped with all modern fabrication facilities. The estimated amount of contracts remaining to be executed was Rs 23.34 crore at the end of March 1991. The work on the 15,000 tpa integrated steel plant for making cold rolled steel strips at Wardha in Maharashtra is making steady progress. However, some delay in commissioning is expected due to the foreign exchange crisis.

During the year under review, the company issued fully convertible debentures

of Rs 124.86 crore to one lakh investors. Fifty per cent of the debenture issue is due for conversion, increasing the capital base to Rs 17.79 crore. This will bring down the debt-equity ratio substantially from the current level of 4.87:1. The interest cover rose from 3.37 to 4.04 in 1990-91. Gross return on investment works out lower at 4.77 per cent compared to 6.94 per cent in the previous year. The turnover ratio also came down to 0.42 from 0.63. This was mainly due to the faster rise in in-

vestments than in net sales. However, the company earned a higher return on net worth at 31.47 per cent compared to 29.36 per cent in 1989-90.

The total funds flow in 1990-91 was Rs 76.01 crore. External capital accounted for 94 per cent of the total sources of finance. More than 50 per cent of the funds was utilised for investments in units of UTI to save tax. The other applications of funds were increase in fixed assets, sundry debtors and cash and bank balances.

IN THE CAPITAL MARKET

Akhil Ceramics

AKHIL CERAMICS is entering the capital market with a public issue of 19,60,000 equity shares of Rs 10 each at par. Of the issue, 2,61,500 shares are reserved for preferential allotment and the balance of 13,98,500 shares are being issued to the public. The issue will open on August 26 and close on September 6 or earlier, but not before August 29. Akhil Ceramics, promoted by S Ramana, was incorporated as a public limited company in October 88. It is implementing a project for manufacture of floor and wall ceramic tiles with an installed capacity of 13,000 tpa using the cost effective dry grinding technology. The plant is located at Kayam in Chittoor district of Andhra Pradesh. The major items of machinery are being imported from Mori Spa of Italy; the company's collaborators. Erection of the plant is expected to be completed before the end of September and the project is likely to be commissioned in October. The total cost of the project is estimated at Rs 13.30 crore which will be financed as follows: equity capital Rs 4.63 crore (including promoters' APIDE's share Rs 2.67 crore), super term loans Rs 3.5 crore and foreign currency loans Rs 3.30 crore. Of the total production, 65 per cent would be exported to the company's collaborators as per a buy back agreement. The lead managers to the issue are Canbank Financial Services and SBI Capital Markets.

Indian Acrylics

INDIAN ACRYLICS, promoted by Punjab State Industrial Development Corporation and R K Garg, managing director of Steel Strips, is entering the capital market with a public issue of 2,86,70,000 equity shares of Rs 10 each at par totalling Rs 28.67 crore to finance in part its project to manufacture acrylic fibre with an installed capacity of 20,000 tonnes per annum. The project is being set up at Harkishanpura district Sangrur, Punjab at a total cost of Rs 190.24 crore. Du-

Pont, USA, with whom the company has entered into a technical collaboration, is providing complete know-how and engineering assistance. Further, Du Pont in association with Chemtex, USA, who are supplying the major part of process plant machinery, is assisting the company in the design and supervision of erection and in the commissioning of the plant. Du Pont and Chemtex plan to adopt this plant for their future technology transfer activities for acrylic fibre and also plan to assist Indian Acrylics in exporting up to 3,000 tonnes a year through their worldwide marketing network, according to F J Martinez, president, Chemtex International, New York. Asian Development Bank has an equity participation of Rs 32.5 lakh in Indian Acrylics besides providing a loan of \$5.9 million for the project. Out of the total public issue of 2,86,70,000 equity shares, 32,50,000 equity shares are reserved for preferential allotment and 57,00,000 shares are to be allotted to mutual funds. The remaining 1,97,20,000 shares are being offered to the public for subscription. According to R K Garg, managing director of the company, no problem is envisaged in selling the product as there is a tremendous demand for it. Commercial production is expected to start in October 1991. The subscription list will open on August 26.

Sunderban Fertilisers

SUNDERBAN FERTILISERS is setting up a plant for the manufacture of 66,000 tonnes of single superphosphate per annum and 33,000 tonnes of sulphuric acid per annum at Mouze Kismet, Sukhmit Rajganj district, Jalpaiguri, West Bengal at an estimated cost of Rs 12.75 crore. To finance in part the cost of the project, the company is entering the capital market on August 26 with a public issue of 20,00,000 equity shares of Rs 10 each at par totalling Rs 2 crore. According to Hardev Singh, chairman and managing director of the company, the plant will

be the first of its kind within a radius of 400 kms. The annual demand for SSP is expected to be in the neighbourhood of 51.9 to 62.2 lakh tonnes by 1992-93 as against the installed capacity as on 1.10.1989 of 49.99 lakh tonnes. The company does not therefore foresee any problem in selling its production of SSP. The lion's share of its production of sulphuric acid is intended for captive consumption. The estimated figures of sales turnover and net profit for the eleven months period ending March 31, 1990 are Rs 600 lakh and Rs 17 lakh at 70 per cent capacity utilisation for 1989-90 Rs 1,600 lakh and Rs 90 lakh (80 per cent) and for 1993-94 Rs 2,000 lakh and Rs 180 lakh. Commercial production of SSP is expected to commence in September and that of sulphuric acid in October 1991.

Dhanashree-1991

ILC MUTUAL FUND is offering Dhanashree 1991, a high income and growth oriented scheme assuring a minimum guaranteed dividend of 13 per cent per annum. Dhanashree 1991 units of face value of Rs 10 each are being issued from August 1 to September 30. Applications are to be made for a minimum of 100 units and thereafter in multiples of 50 units. There is no upper limit on investment. ILC Mutual Fund has already launched successfully 10 schemes of various types and has mobilised nearly Rs 800 crore in the first two years of its operations from 3.5 lakh investors. Dhanashree 1991 will be terminated after the sixth year but not later than the seventh year from the date of commencement of the scheme viz. October 1, 1991. The units can be encashed after October 1, 1993 at the repurchase price to be declared periodically by ILC Mutual Fund. The units will also be eligible for loan facilities provided by Central Bank of India. The units will enjoy tax benefits under Section 80I of the Income Tax Act, Section 5(1) of Wealth Tax Act and Section 48(2) of Income Tax Act on long term capital gains. There will be no deduction of tax at source.

Calcutta Diary

AM

It may take a couple of months, or a couple of years, but a revulsion is bound to set in, for inflation hurts, joblessness hurts and the aggravation of inequalities between regions, classes and groups has harsh real life implications. To hand the country back to capitalist colonisers is anti-history. It is also wretchedly bad economics, as finance ministers will learn, in due course, to their cost.

APPLAUD him for his stamina, praise him for his gumption. At the completion of his one hundred thirty-five minutes long budget speech, which he has dedicated to the memory of Rajiv Gandhi, the finance minister turns his attention toward the direction of opposition leaders. Stop politicising economic issues, he admonishes them.

Is it innocence, or feigning at it? If it were a matter of a certain lack of literacy, an inability to see the interconnection between categories of reality, how does one explain the breathtaking chicanery over the abolition of the fertiliser subsidy? They need not worry, the finance minister assures the farm lobby, he will compensate them for the withdrawal of this subsidy by raising procurement prices. It would obviously be politicising the issue if it is pointed out that by doing what he has proposed to do, he will be compensating only the rich farmers; the poorer ones, those without surplus, will be left in the lurch. Since the finance minister could not be expected to bother about such niceties, at this stage, the more intense market lovers will perhaps take over. By their failure to produce for the market, non-surplus raising peasants, you and I will be told, have taken themselves out of the orbit of any sympathetic consideration, their poverty is clinching evidence of their inefficiency, the decision not to do anything for them is therefore sound, and no quarters deserve to be given to those who regard it as politically motivated.

Of course the finance minister will not disclose on his own that while raising procurement prices, he will also simultaneously increase issue prices. Nor will he admit that his action will be responsible for pushing up grain prices across the board, and therefore, soon all farm prices across the board. That denouement could only give a further boost to the rate of inflation, which in any case had reached the annual average of 25 per cent in the pre-budget week. The finance minister will keep his part of the commitment to the Fund Bank overlords to narrow the fiscal deficit in the first round, what happens

in the succeeding rounds he might as well leave it to the market-lovers.

Meanwhile a handful of conscience-stricken men and women will stand their ground. They will evoke derision, and be the butt of much righteous indignation. The Indian bourgeoisie has made up its mind: the IMF or bust, the new finance minister or bust. The media, for instance, are in raptures over the devaluation—sorry, the adjustment of the exchange rate—over the new trade and industrial policies, over the budget. Facts were never actually the strong point of the media. It is no different in the current season either. The budget lowers the proportion of direct tax yield to total tax revenue. The newspapers are not deterred, it is a soak the rich budget blare their headlines. Some fudging is necessary, it is part of the social responsibility of the media for otherwise gullible people might begin to place trust in their own experience such that the fiscal burden is exclusively on the poor, and the affluent set is being let off lightly. This is not politicking, but serving the cause of the nation's second war of liberation.

It is again evidently not playing politics to heap the blame for the current economic woes on the doings and misdoings of the two preceding regimes alone. The present finance minister, one would have thought, will find it difficult to dissociate himself from decisions taken by at least one of those regimes: he was an integral part of it as adviser to the incumbent prime minister, enjoying the status of a cabinet minister. Trivialities of this nature are the hobgoblin of little minds. Slightly more worrisome is selective amnesia, the failure to attribute, either squarely or faintly the country's slide into the debt trap to policies practised by those who had presided over the polity during nine tenths of the preceding 80s. Aha, what a convenient memory cell it is! It skips remembrance of occasions such as when another famous former civil servant, once again principal economic adviser to the then existing regime, had let drop the pearl of wisdom that the poor in this country

are a most understanding lot, they would rather go hungry than not possess a colour television set. That statement was the progenitor of many momentous decisions. Pundits were immediately imported from the Bank and the Fund, India, they complained, was not borrowing enough in the international money market. What a waste, this huge, big country should have learnt the art of borrowing overseas and spending such borrowed funds with an easy abandon, thereby ensuring growth at breakneck speed, high spending is, after all, quintessential Keynes. The advice proffered was gratefully accepted, and acted upon. Within the span of a half-a-dozen years, the country's external indebtedness quadrupled. This development did not disturb the cooing of the Doon school of economic thought, as K N Raj has gallantly suggested, it was all beyond their depth. There was then that celebrated late summer and early autumn of 1989, facing a dicey general election and an artificial domestic shortage of grains, edible oils and sugar, the regime used the overseas connections of such public agencies as the State Bank of India and the Oil and Natural Gas Commission to borrow at very stiff terms, short term money—perhaps as much as four billion dollars. To recount how, when and why the debt service ratio jumped from below 15 per cent to close to 40 per cent is evidently not economics but airy-fairy politics: a finance minister cannot possibly permit himself to stray into that kind of *cul de sac* in the course of his budget speech. Instead, he turns into a latter day Asoka Mehta and indulges in wildest day dreaming. It is basically a matter of definition depending on the identity of the construction worker, building castles in the air is by no stretch an indolent version of politics but hard nut economics. Just grant them one hundred per cent equity participation, multinational companies will come and occupy every nook and corner of the country; private foreign investment per annum will give or take a couple of years, zoom from the level of around fifty million dollars to as much as three billion. The foreigners will flock in, they will be entreated to take charge of the economy, it is however sheer calumny to suggest that we will in the process shed some of our sovereignty. Such insinuations are politicking of the most odious order. In case the foreigners arrive, they will no doubt know how best to take care of their royalty and dividends and the gains from transfer pricing, something might also be made to happen to the country's external terms of trade, the net foreign exchange contributed by foreign investors could then turn out to be negative, as it is at present.

Are not speculations of this nature however in effect sabotaging the patriotic cause? In this hour of gravest crisis, when a war of liberation is on, should not there be a new theism: in foreigners we trust?

The lesson sinks in, one should keep to the straight and narrow path, and not raise foolish questions. The finance minister himself, though, in one unguarded moment, has alluded to the other side of the coin. Whether the westerners arrive in strength to repossess their empire or not, devaluation and the new trade and industrial policies will, according to him, make life difficult for large sections of the citizenry. A few thousand extra factories are to close, hundreds of thousands of workers in the organised sector are to lose their jobs, umpteen small-scale units will be unable to absorb the *shokku* of the July devaluation and will go to the wall. These are empirical correlates of the sacrifice that collective abstraction, the nation, has to bear because the non-*hai polloi* chose a way of living for themselves in the past decade. Should the Fund and the Bank play ball, and the private buccaneers too behave, the country's rich might still succeed in protecting that arcadia of theirs. This acute skewness in the sharing of the burden of the second war of liberation makes it lose some of its lustre. But, then, Wittgenstein shades off into Chomsky, words are what you make of them, abdication of national sovereignty is liberation.

The Plan is in limbo, the public sector is to be Thatchered, monopolies will be left in peace to mulet the citizens. Apart from monopolies and the big houses, some foreigners, at least a sprinkling of them, will, hopefully, be around. Should one have the temerity, one could still ask the finance minister whether he feels confident of achieving even limited success in the two principal—and inter-connected—areas his attention is evidently riveted on: containing the rate of inflation and improving upon the country's export performance. Devaluation has raised the rupee cost of imports, all along the line, at the first go. That could still be only a beginning. Since Fund-Bank type structural adjustment insists on raising the proportion of imports in national income, and import duties are specifically lowered for the purpose, either the volume of imports must increase, or national income must shrink, or both phenomena must occur together. Domestic costs are bound to rise in the wash. Export prospects will therefore dim. Even otherwise, considering the state of expectations and the budgetary decision—no doubt because of Fund-Bank prescription—to raise revenue mostly through higher excise levies and ad-

ministered prices, inflation will experience a hastening of pace, providing independent explanation why exports are likely to remain where they are, or might even decline. It will be perhaps politicising the issue to remind the finance minister that the rupee got depreciated to the extent easily of three hundred per cent in the quarter of a century since 1966, and yet, exports as a proportion of both national income and overall global exports did not bother to move up. For a third world country exports, after all, are not a determinant, but a 'determinate' variable. The finance minister will presumably however rest his case by taking recourse to a clinching repartee: no empirical law exists which says that something which has not happened in the past will not happen in the future either.

Some confidences are supposedly not to be transgressed. Why strain yourself to delve into the economics of the decision to hand over a hundred crore of public money to a private trust to honour the memory of precisely the same former prime minister, during whose tenure all the things that could possibly go wrong with the economy went wrong; it hardly matters whether he understood, or had the capability to understand, the implications of the decisions taken by him or on his behalf. To confess to a feeling of nausea on account of the sycophancy oozing from each pore of the budget speech will only reveal one's subjective bias: it takes all sorts to constitute the universe, someone's economic wisdom is someone else's obscenity.

Besides, none of this is really relevant. The national economy has been coaxed into entering a phase of frenzy the consequences of which will duly work themselves out. The media have made up their mind, or have been helped to do so. Those wanting to pursue the path of independent self-reliant growth are to be given no quarters; they, it has been decided, deserve to be despatched to the asylum, they are inward-looking as well as backward-looking. It is a bit awkward that the warnings they issued a decade ago have turned out to be devastatingly right, it is best to suppress that fact. No need either to mention, morning and afternoon, about the debt trap and the falling level of unemployment and the rising number of closed and about-to-close industrial plants. Rather, attention should be gleefully drawn to the contortions the left are going through. They have to oppose the new set of economic policies for dear life, but they dare not vote against the regime; suppose the government is voted out, a poll-weary electorate will apparently not forgive them. Whether it will forgive the left for not voting down the anti-

people economic measures is a matter best left undiscussed.

Stirrings are nonetheless bound to take place at other levels, both inside the system and on its periphery. Finance ministers out to surrender the nation's interests to foreigners are not the final arbiters of history. It may take a couple of months, or a couple of years, but a revulsion is bound to set in, for inflation hurts, joblessness hurts, the aggravation of inequalities between regions, classes and groups is not an inert statistical category, it has harsh real life implications. To hand back the country to capitalist colonisers is anti-history. It is also wretchedly bad economics, as finance ministers will learn, in due time, to their cost.

Bank Nationalisation Anniversary Collective Amnesia

D N Ghosh

Now that some US development organisations are planning to promote actively micro-enterprise lending by banks, will our own much-maligned 'priority sector' lending schemes be looked at more objectively?

US development organisations are finding that some of the world's poorest entrepreneurs repay their debts at rates approaching 100 per cent... These organisations are expanding programmes that already lend thousands of these struggling entrepreneurs amounts ranging from \$ 50 to several hundred dollars... The micro-enterprise lending is the hottest thing in development since the green revolution. (*Asian Wall Street Journal*, June 10, 1991.)

SUCH micro-loans, as part of poverty-alleviation credit programmes, have been the pride of the Indian banking system for over the last two decades. Country observers from western economies have not been enthusiastic as such about these credit programmes mainly because they were developed as part of a state interventionist strategy for the benefit of small borrowers. Now that several US development organisations (particularly ACCION, a Cambridge, Massachusetts-based non-profit international development group) plan to promote actively such small economic activities, micro-lending seems set to be hailed as one of the spectacular financial innovations, shedding its offensive third world parentage. Certainly not an unwelcome development particularly at a time when some of the interesting innovations made in our banking scene are fast losing their erstwhile crusaders.

To micro-lending has come to be added several innovative features. Take potentially credit-worthy borrowers, millions of small borrowers willing to engage in productive enterprises in over 5,00,000 villages all over the country. An exclusively profit-oriented system would have shut them out, but the integrated rural development programmes—a combination of credit from banks with subsidy from the budget—is a strikingly imaginative response, helping potential borrowers stand on their own and, more fundamentally, give them self-respect and generating challenge, but not too overwhelming to snuff out their enthusiasm. Look again at the interesting credit delivery system: for

millions of potentially credit-worthy borrowers, many of them illiterate, in backward and underdeveloped regions, the delivery system, contemptuously described as 'loan melas', do generate awareness through conspicuous demonstration of the developmental impact of the banking system.

For a country like India, such micro-credit lending programmes, core priority

sector lending as it has come to be characterised, has to continue with increased vigour and diversification; it has to cover all types of productive endeavours connected with small business, local services, agriculture and agro-based industries. For agriculture, in particular, which claims a good portion of commercial banking advance, the intensity of such lending has to increase at a very fast pace. Yield per hectare in agriculture averaging about 2 tonnes has to move up to the international average of 4 to 5 tonnes per hectare. This cannot be brought about unless credit inputs along with other inputs are deployed, through directed and systematic programmes in areas with minor irrigation, in dry land cultivation and in wasteland development. What we have covered so far and achieved is a fraction of the potential that exists. We cannot afford to slacken, notwithstanding the abuses which have taken place in recent days in the lending programme in rural

areas, abuses which the political parties should have guarded against for the sake of the interests of the constituents they serve but which, unfortunately, they subverted for their narrow short-term electoral advantage. Mindless interference in disbursement of such loans has to be countered, but can we afford to use it as an excuse for faulting the rationale of the programme itself?

Strident voices are heard today against all directed credit programmes as such. Understandably, that is the fall-out of revulsion against political interference in the administration of the credit programmes and political exploitation of the financial infrastructure for purposes not so intended. This provokes knee-jerk reactions, not uncommon in the corridors of policy-makers, that even if the banks had not been brought under public ownership, the banking system could have delivered the goods expected of it by the state. Leave the debate aside for a moment and look simply at the behavioural motive and pattern of the commercial banking in the pre-nationalisation days: between the period March 1961 and March 1968, the number of borrowal accounts in the banking system was virtually stagnant, at around 1 million; in fact, to be precise, the number on the later date was lower by 14,000 accounts! A telling piece of statistics, does it need any further elaboration? Why is it then that today, on the anniversary of bank nationalisation, there was not even a semblance of a ceremony by those who were once acknowledgedly by the vocal crusaders for public sector banking and who had, in the past, unfailingly exploited every conceivable mass media. The reasons, not far to seek, should not be swept under the carpet.

While commendable work has been done in the core priority sector lending in some rural and backward areas, it is also undeniable that there has been a sharp deterioration in most of the elemental functions of banking itself in areas which were once, in the pre-nationalisation days, centres of excellence. If one were to go by the usual yardsticks, the payment system, processing cost, transaction time—the points where the public come into contact with the banking system—there has been deterioration in efficiency of unbelievable proportions. Productivity in Indian banking enterprises is reported to have been adjudged the lowest by international banking standards. Several such institutions have become co-operative enterprises of all categories of employees with little concern for those who use the banking system.

Those who argue for privatisation have their own reasons: for they believe that market forces would lead to efficiency,

result in the elimination of political and bureaucratic control, modulate the target of directed lending to the absorptive capacity of each individual bank. This could or could not come about under private ownership, but what would *not* take place under private ownership is the continuation of the thrust towards development lending which has to continue with full vigour in most of the regions of our country.

The crusaders for developmental banking are however losing their battle: they have to look inwards. They have to ask themselves: have they not connived in bringing this industry to the sorry state that it exhibits today. A crusader for efficiency has to contend with several vested interests and these primarily start from within the bank itself. It is easy to be committed to an ideology but it is infinitely difficult to be committed to efficiency which demands a change in work style and change in work culture. The existing rules of the game within the industry are dictated by entrenched vested interests at all levels. It has to be demonstrated that a publicly-owned bank can operate effi-

ciently (and there is no reason why it cannot) and at the same time continue the lending programmes. Will any political party take up the challenge and persuade the public at large that they are as much committed to those who use the banking system as to those who run it?

Adherents of public sector banking are fast losing their moral right to defend a system which is breeding inefficiency at all levels, on the part of all those who are responsible for running it, aided and abetted by the political class out to exploit them to their advantage, by interfering with the disbursal of loans in the core priority lending areas or in the larger loans for the industrial houses. The country expects a viable, efficient and impartial banking and financial system, but would the votaries of public sector banking volunteer to be crusaders for this cause as they were once crusaders for nationalisation? They have sensed the mood and cannot risk harping on the same old tune. Their zeal has dimmed and they are playing the game of escapism: witness the deadly collective amnesia on the bank nationalisation anniversary, July 19, 1991!

INTERNATIONAL AFFAIRS

Welcoming the American Horse

GPD

In a political sense, the Manmohan Singh nose dive has been neither secret nor surprising. It appears so only because some people in this country have been busy with the Mandal and the Mandir revolutions.

THE gentleness with which discussions and debates over the Manmohan Singh package of economic changes and 'reforms' are being conducted is indeed surprising. The question of economic sovereignty is unlikely to rock the government. The grant of Rs 100 crore to yet another monument (in this case a trust) to the scion of the Nehru family seems to have irked the MPs more than the sell-out of the national economy. Nobody is bothered about that as much as about that wretched grant. Parliament would be well advised to pass a bill that any member born in the Nehru-Indira Gandhi family is automatically a Bharat Ratna unless otherwise stated and that some percentage of the GDP of this land would be reserved for creating as many trusts as the Nehru-Indira Gandhi family might wish to create in whomsoever's name in future. Parliament can also pass a resolution that all ancestors of Jawaharlal Nehru are also Bharat Ratnas. That would at least stop

the debate in the house and in some sections of the looney left.

The other big issue that one reads about is that of 'secrecy'. That sounded rather strange to our non-economist ears. The thrust of India's policies over the last six years (inclusive of the JD rule), if not longer, was clear enough. There were any number of people from the Congress to the BJP who have been admirers of the South Korean experiment and rather naive believers that it can be repeated here. To say that, however, is to risk being accused of harbouring ideological hang-ups—as though slavery as a concept were free of ideology! In *Mruchakatikam* there is a little conversation which comes to mind here. The 'dasa' who tells the truth that Charudatta had not killed Vasant Sena is disbelieved by one and all. He laments that in this world no one believes you if you are a 'dasa'. Slavery has an ideology of a kind. And before long Indians would discover that 'dases' are never heard, if

they have not already noticed the decreasing resonance of the Indian voice in international politics and economics

Some commentators are celebrating the triumph over the left, as though Stalinists had been ruling the country for the last four decades or more. A socialist is answerable for the errors of omission and commission and the crimes of all those these pen-pushers choose to describe as 'socialist', while these pen-pushers themselves are not guilty of either capitalist or communal excesses in this country. Like a leaf in water they remain untouched by everything! It is a convenient position to assume. A scribe of a national daily can then even manufacture or collect stories and actually use them as arguments (vide the attack in *The Times of India*, August 2, 1991), on left-wing economists. The characterisation is dishonest and faulty on many a score. To cite just one example, Rajni Kothari was one of the signatories to that document. He is neither a Marxist nor an economist. Anyway, these people should undergo some training which our ancient Naiyayikas had. The 'uttara paksha' can be argued only when the 'purva paksha' has been represented in all fairness and impartiality and one's arguments cannot be based on hearsay and 'stories' collected here and there.

This is also the reason why the argument about 'secrecy' cannot be overdone. We do not think that either the economic bureaucracy or the political leadership or the media had left anyone in doubt especially after the Gorbachev phenomenon, that it was only a question of time before the process of dismantling of planning and the public sector would begin. If our media people are to be believed, defence of planning and social welfare is defence of the *status quo*. Quite a number of these enemies of planning and imagined socialism are great admirers of the Hindu civilisation. It might therefore be useful to remember what the ancient sages said about the meaning of words. *Yat parah sa shabdah* averred they, which means words mean what they signify. If planned development means the *status quo* then one must grant that words cannot possibly mean anything. In that case, even Manmohan Singh's 'radical economic reforms' would mean nothing. Be that as it may, the Manmohan Singh nose-dive has been in a political sense neither secret nor surprising.

It appears so only because some people in this country have been busy in the Mandal and Mandir revolution. As the rhetoric of the social revolution (it is to be noted that V P Singh, Sharad Yadav and Paswan, the 'trimurti' of the social

revolution, are rather quiet on the sell-out) and the rhetoric of the Mandir were the order of the day, nobody had time to examine what the bureaucrats and ex-bureaucrats were doing to prepare the country for whatever has happened.

One has to be fair to the Congressmen. That such a sea change in economic policies can occur within barely a month of the Congress being installed in power or that the preceding governments did not preside over the preparations for this change is hard to believe. One can almost predict that once the new economic order settles down (or more accurately starts sinking in) a host of documents would be released by this government (unless, of course, Cauvery or other waters drown it) to demonstrate that everyone is basically in agreement with it. Manmohan Singh said so to K R Malkani, the BJP vice president in so many words on Doordarshan. The turn of some other political groups, one takes it, will follow. Manmohan Singh has not sprung any surprises. He has done what the elite in this country have been wanting to see happen for a long time. If there was any secrecy it was typical of the caste system. The neo Brahmins would not share their thoughts with the Shudras! But that is about all. The Shudras should not be surprised. If they are this only means that they have not been watchful enough.

It appears as if president Bush is out for an 'Ashwamedha' sacrifice. In ancient India a triumphant king would let his horse run loose and fought kings and chieftains who challenged the horse. Some fought (at times mindlessly may be) while some others surrendered without protest. West Asia has been pacified. A king who challenged the American horse there has been shown his place and preparations for his banishment are on. The Indian elite has been more than ready to welcome the American horse. The triumph is complete. South east Asia was safe for the Americans anyway. So to the Americans the world must appear extremely well behaved just now.

In the meanwhile nobody cares to explain how the IMF and World Bank are an option. That the left is looney does not quite prove that (that the left is looney is not the belief only of the right. Many in the left these days appear to share it). That we shall not be a banana republic would require careful explaining for once keeping the left out of it. The left does not matter and is unlikely to matter for some time anyway. But that still does not answer one overriding question nor does the anti-left rhetoric negate that question. Simply put that question is: Why will India not become a banana republic under the new dispensation?

EXTRACTS FROM STATEMENT OF
SHRI RAUNAQ SINGH (CHAIRMAN
AND MANAGING DIRECTOR AT THE
18TH ANNUAL GENERAL MEETING
OF THE COMPANY ON 9TH JULY AT
ERNAKULAM

THE REWARDS OF EXCELLENCE

"Ladies & Gentlemen,

I extend to you a hearty and cordial welcome to the 18th Annual General Meeting of your company

"REWARDS OF EXCELLENCE

After achieving one of the most spectacular turnarounds in corporate history your company has never looked back since 1985/86. Each year recorded higher and higher sales turnover, profitability and efficiency. Your company firmly believes that records are meant only to be broken. The financial period under review was no exception. Sales turnover registered an increase of 88% accompanied by 116% surge in gross profit. This compares favourably with the industry trend. The performance would have been even more impressive had there not been loss of production for two and a half months due to a labour dispute. Thanks to the maturity and understanding displayed by the Trade Unions, a three year truce has been concluded. The Cochin plant is now operating at peak efficiency like never before. Your company is all set to break new records even without the benefit of additional output from the Gujarat plant which is scheduled to start trial production by end 1991. The future years should be really rewarding for all those who have stood by the company in difficult years gone by viz investors, customers, suppliers, financiers and employees. Appropriately the theme of the Annual Report of your company for 1989/91 is 'Rewards of Excellence'.

Excellence cannot be sustained without rewards and there cannot be any rewards without excellence. Excellence in every way that can be measured or perceived—in production, quality, customer service, investor's trust, employee satisfaction, professional management, business ethics etc.

"EXPORTS

During the period under review your company recorded an export turnover of Rs 21.88 crores as compared to Rs 11.84 crores in the previous year, representing an annualised growth of 40%.

HIGHLIGHTS

- 40% DIVIDEND FOR 1989-91
- RECORD SALES AND PROFITS
- KERALA PLANT WORKING AT FULL CAPACITY
- GUJARAT PLANT TO BE READY BY END 1991
- 30% GROWTH IN EXPORTS
- BRIGHT PROSPECTS FOR ROAD TRANSPORT

"MARKETING

Over the years, your company has established itself as a price/quality leader in certain market segments. A wide network of committed and loyal dealers is a crucial strength of your company."

"LEADERSHIP IN QUALITY

Quality has been a way of life in your company right from its inception. It has been the hallmark of success of every product that bears the stamp of Apollo Tyres. To keep abreast of consumer preferences and emerging trends, technology needs to be updated continuously through in-house R&D and guidance of our collaborator. Your company is receiving invaluable help and guidance from General Tire International Corporation, USA which has now become a part of a bigger group viz M/s Continental AG of Germany. Continental in turn have agreements for exchange of technology with two leading Japanese Tyre manufacturers. Thus your company has direct and indirect access to the best international technology.

"TAX BURDEN

The Tyre Industry has been jointly and severally representing to the government to reduce the tax burden on Automobile Tyres which is as high as 84-118%. With the new government at the helm of affairs, I hope the Industry plea will receive a sympathetic consideration."

"NEW PROJECTS

The construction of the Gujarat tyre plant is in full swing and is expected to be commissioned by the last quarter of 1991. With the commissioning of this plant, your company will be equipped to double its sales turnover and offer to the customers a better product-mix with up-graded technology. Your company is investing in a joint venture with Gujarat Industrial Investment Corporation for manufacture of Electronic grade Copper Clad Laminates in collaboration with Perscorp AB of Sweden. The unit is being located at Gandhinagar Electronic estate.

Your company owes its leadership in quality and technical excellence to the ongoing guidance and help of its collaborator, General Tire International Corporation of USA.

Thank you

Kochi
9th July 1991

(RAUNAQ SINGH)

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

HARSHAT ATY/TH

NEW DELHI

Towards Neo-Colonial Dependency

BM

An alliance is being forged between foreign capital, above all the multinationals, enjoying the backing of the administrative and political authorities in their countries and comprador business interests enjoying administrative and political patronage in India. This is the deadly alliance which will drag India into neo-colonial dependency.

THE finance minister, Manmohan Singh, had gone to town with the promise that his budget for 1991-92 would be a resounding advance towards what is euphemistically called structural adjustment of the Indian economy. This promise he was unable to fulfil. The budget has actually turned out to be a limited and in some ways a half-hearted exercise. His alibi has been the short time available to him for making the budget. But the fact is that political constraints for a new entrant into the currently turbulent arena of Indian politics are necessarily formidable. The budget is regarded by many, especially the votaries of structural adjustment as ordained by foreign creditors, as inconsistent with rather than integral to, as Manmohan Singh likes to claim, the major policy adjustments which have been pronounced—the steep devaluation of the rupee together with a liberal foreign trade, in particular import, regime and an industrial policy for opening up the Indian market for easy entry of foreign capital directly or in collaboration with comprador business interests. The industrial policy statement, significantly, was announced before the budget was presented on the same day and would seem to have robbed the budget of its importance as the principal instrument of making the economic policy and funding its implementation. But, again, it is not to be missed that it was considered prudent to refrain from coming forward with a new Industrial Policy Resolution to supplant the Industrial Policy Resolution of 1956 and be content with yet another industrial policy statement. The minority Congress(I) government has indeed to tread carefully, especially in parliament, and was advised to refrain from presenting the revised policy for approval of parliament. The fact, however, remains that the latest industrial policy statement is totally subversive of the content and direction of the IPR of 1956.

The Narasimha Rao government has already lost much of its steam to push ahead with policies and plans which will win for it what is euphemistically called credibility with foreign creditors. Domestic political reality and the hectoring creditors abroad have really pushed the minority government into a corner. This realisation must have dawned on Manmohan Singh when he was called upon to make the budget in a hurry. He often admits this much, even in public, especially when he has to strike ungainly postures before not only the opposition political formations but also, and even more so, the faction ridden Congress(I) Party in which it cannot be easy for him to find a comfortable position. The laboured attempts by him to make a display of his loyalty to the party and its election manifesto have turned him from the economic wizard who was relied upon by powerful vested interests, Indian and foreign, to pull the country out of a deep economic crisis towards a growth process favourable to them into a sorry figure in political office in which his professional skills are under a dark cloud. This realisation must have grown as he has to face widespread criticism of his performance from the political opposition as well as Congress(I). The Rs 100 crore allocation for the Rajiv Gandhi Foundation and the withdrawal of a portion of the fertiliser subsidy have put him in a spot. The durability of the Congress(I) government has already come under strong doubt in political and media circles.

The budgetary sums that Manmohan Singh has presented a truly mock at his pompous claims about restoring fiscal balance and stability to the economy. The tell tale figures which stand out in his long budget speech are many. But especially notable in this context is the position of the fiscal, budgetary and revenue deficits. Without additional resource mobilisation the budget deficit is estimated at Rs 9,724

crore, the revenue deficit at Rs 15,859 crore and fiscal deficit at Rs 39,732 crore, he said at the close of the part A of his budget speech. Towards the end of the part B, he said that, taking both direct and indirect taxes into account, the net gain to the centre in the current year was estimated at Rs 2,005 crore and that with this, the budgetary deficit of the centre for the current year would be Rs 7,719 crore, the revenue deficit Rs 13,854 crore and the fiscal deficit Rs 37,729 crore. Looking back at the budgets since the mid-80s, it would be found that the range of revenue raising by direct and indirect taxes has been the same as in the current year. But at the end of every year, the revised estimates of deficits have been found always to exceed the original estimates. In 1989-90, for instance, the revenue deficit was Rs 11,912 crore which was over Rs 3,000 crore more than the budget estimate. In 1991-92, the first estimate put the deficit at Rs 13,032 crore which swelled to Rs 17,585 crore in the revised estimate. The first estimate for the current year is Rs 13,854 crore, higher by Rs 500 crore than for the last year. It can be taken for granted that the deficit will swell to a figure higher than last year's in the revised estimate. Going by the experience in the first four months of the year when revenue from taxes, especially direct taxes, showed a decline, and expenditure swelled, it is likely that the deficits will grow more than even in earlier years, the cuts proposed in development expenditure notwithstanding. What is critical in respect of the deficits shown in the budget, which has tended to be glossed over by Manmohan Singh, is that the revenue deficit remains much larger than the budgetary deficit implying that resources, including from abroad, raised ostensibly for investment and development will continue to be diverted to current consumption. This means that indebtedness of the government, both internal and external, will grow relentlessly without building up repayment capacity and India will be pushed deeper into the debt trap. Interest payments on internal debt as well as external debt have already swelled to unsustainable levels. The fact is that receipts of credits, especially from commercial sources abroad, have already become negative and fresh credits have to be raised on onerous terms to meet service charges.

DRIFTING INTO STAGFLATION

The much dreaded harsh budget has thus eluded the budget makers under the present political dispensation. The budget

proposals had to be formulated within the frame of populist politics in the domestic arena and increasing dependency on foreign creditors to manage the balance of payments. This path, trodden with increasing recklessness in the 80s, has landed the Indian economy in the present morass. The effort to moderate the budgetary imbalance by reducing consumption expenditure and increasing the revenue of the government has failed to take off. The much-vaunted reduction in the fiscal deficit from 8.5 per cent to 6.5 per cent of the GDP as demanded by IMI-World Bank, besides being illusory and not likely to be realised in practice, has been attempted by way of drastically diluting the development role of the state. The avoidance of concessions in direct taxes on income and wealth and some additional taxes on the corporate sector and on items of elitist interest have not brought material improvement in the overall fiscal condition. The revenue expenditure or expenditure on the current consumption of the government is estimated to increase from Rs 74,966 crore in 1990-91 to Rs 81,383 crore in 1991-92. Capital expenditure, on the other hand, will increase from Rs 31,751 crore to only Rs 32,039 crore. Incidentally, in the case of defence expenditure, however, while there is a moderate attempt at saving on the revenue side, the increase in the capital account is substantial which has its own implications for the balance of payments.

The budget estimates are based on the assumption that economic growth in 1991-92 will be a modest 4 per cent and the inflation rate 10 per cent. The economy is drifting into stagflation with low growth and high inflation. Significantly, both exporters and rich farmers, who have emerged as the most influential economic agents in the system would enjoy total exemption from income tax which bars any serious move to enlarge the social base of direct taxes which is a must for any meaningful reform of the tax structure. Again, the finance minister, who is so strident in his criticism about spending away the oil surpluses accumulated in past years and offers this as the justification for the hike in petroleum and LPG prices (not touching diesel and kerosene for populist reasons), has not hesitated to adopt the proposal of his predecessor for selling the equity of public sector undertakings to raise revenue for the government to meet its current expenditure. This sale of assets is bound to have deleterious implications for the resource base for maintenance, modernisation and expansion of commercial enterprises in the public sector, especially as the budgetary support for this purpose is being withdrawn. The budget has initiated

the first moves to dismantle productive enterprise in the public sector.

The invitation to direct foreign investment on what are called liberalised terms, the emphasis on interest rates based on credit-worthiness of borrowers, rather than social priorities, and restructuring the Bureau of Industrial Costs and Prices into a Tariff Commission are probably the most noteworthy proposals in the budget in direct support of the so-called market-oriented liberalisation of the economy. Manmohan Singh has, however, so far only tinkered with the budgetary sums to prepare the ground for negotiations on the IMF loan and the conditionalities attached to it. But the policy pronouncements of the government have been more forthright and far-reaching.

PRIMACY FOR MULTINATIONALS

In the series of adjustments in industrial policy during the 80s opening the doors wider for direct foreign investment has occupied the pride of place. This has helped some scaling up of the flow of foreign private capital to India from the insignificant Rs 10 crore per annum in the 70s to an annual average of Rs 100 crore in the first half of the 80s and about Rs 200 crore per annum in the second half. There has been also a spurt in foreign collaboration deals with contribution of equity by the foreign partner to share in management as well as use of imported technology on a continuing basis. Signs of the deceleration in respect both of the inflow of foreign capital and collaboration deals had, however, begun to appear towards the close of the 80s, notwithstanding the increased stridency of the assurances of hospitality to foreign capital. The latest statement on industrial policy is a desperate bid to attract direct foreign investment, in particular by multinationals. There is talk of direct foreign investments of as much as \$ 2 billion per annum.

The facile notion, sought to be cultivated by a variety of interested business, academic, administrative and political lobbies, that foreign investors including multinational corporations are standing in the queue to enter India, however, misses the truth that foreign capital prefers to flow to growing economies and flourishing markets. The foreign investor wants safety of investment, quick returns and repatriation of the surpluses that are generated. The returns do not have to be in the form of dividends and royalty fees alone but include surplus generated from transfer prices of equipment and raw materials imported from captive sources and so on. To

rely on foreign investment to solve the payments problem, achieve development goals or subserve social priorities is, therefore, a fanciful notion. The nexus between direct foreign investment and promotion of consumerism among upper and middle classes is also palpable from the behaviour of multinational corporations already operating in India. The prolonged consultations under UN auspices to prescribe proper socio-economic norms for multinationals ended in total failure because of the obduracy of the multinational corporations. The fact to be reckoned with is that direct foreign investment tends to emasculate impulses for economic growth which satisfy mass needs and promote self-reliance. The Congress(I) government has formally resigned itself to this position in its industrial policy resolution.

The industrial policy statement also, significantly, gives primacy to the role of the multinational corporations in the bid to attract foreign investment. This is in recognition of the frightening strength of these corporations, their overwhelming weight in the flow of capital goods and services in the world economy. It is no longer deemed enough in their case to allow 51 per cent equity which is proposed to be the general rule for foreign investment; they have to be specially cajoled to come in with capital, technology, management and marketing expertise on their own terms. Hence the decision to appoint a special board "so that we can engage in purposive negotiations with such large firms". In the era of scaling down the development role of the Indian state and withdrawal of administrative controls in the name of liberalisation and efficiency of business enterprise, it is thus admitted as necessary that multinational corporations be treated on a special basis. Indian business interests, it is assumed, are in no position to even effectively bargain with them and there will be need for direct administrative and political initiative to clear the way for the entry of business giants of the world into India in the royal style on specially favourable terms.

FIRA restrictions on the expansion and diversification of foreign companies and corporations in the Indian market are, therefore, proposed to be completely removed. In the case of companies which under the FIRA rules had earlier diluted foreign equity to 40 per cent and become Indian companies, enlargement of their foreign equity is now to be approved. A reverse process of enlarging equity for foreign companies is, therefore, to be set in motion. Joint ventures which are being promoted with great zeal will now involve both joint trading and production ventures in which multinationals are invited

to come in with their high technology and global marketing networks and Indian firms are expected to play the role of subcontractors and provide cheap shop floor operators and labour. India would not, under this scheme of things, attempt to indigenise parts and components which go into final assembly of products for domestic consumption or export and the phased manufacturing programme is to be wound up. On the contrary, components and parts would be supplied by foreign corporations and assembled into the final product by Indian labour. It is proposed, therefore, that foreign equity should not only be allowed but preferred and encouraged not only in the case of new collaboration deals involving import and application of high technology but also in the case of existing enterprises which have only technical collaboration arrangements with foreign sources or are already using the imported technology after its outright purchase.

A new phase in economic growth process is thus planned to be opened through direct foreign investment primarily aimed at the satisfaction of elitist consumption demand in the domestic market and secondarily for exports. All considerations of essentiality of investment for the

economy in terms of satisfaction of mass needs and self-reliant growth is proposed to be extinguished. This fits very well with an investment pattern and production structure to subserve a social milieu and life style which has no relevance for the broad mass of the people and, at the same time, effectively blocks progress towards economic self-reliance. This is already part of the Indian experience. It is disconcerting, though not surprising or fortuitous, that a striking feature of the Indian scene is that foreign investors can easily find Indian collaborators and work through them to ensure security as well as super profits for their investment. Since arrangements for direct foreign investment and collaboration deals with an enlarged role for multinationals are to be actively encouraged and promoted by the administrative bureaucracy and the entrenched political-power establishment, what is being forged is an alliance between foreign capital, above all multinationals, enjoying the backing of the administrative and political authorities of their countries and comprador business interests enjoying administrative and political patronage in India. This is the deadly alliance which will drag India into neo-colonial dependency.

ANDHRA PRADESH

Distributing Favours among Friends

M Shatrugna

Not only do the upper castes dominate in the expanded cabinet in terms of numbers, but they also now hold most of the prestigious ministries

UPPER caste domination with the Reddys in the lead is the hall mark of the much awaited cabinet expansion of N Janardhan Reddy ministry. Barring the supporters of dissident leader Y S Rajasekhara Reddy (YSR), all the factions in the Congress (I) in the state have been accommodated in the reconstituted cabinet. While M Chenna Reddy's faction K Rosiah, D K Samarasimha Reddy, R Chenga Reddy, Uma Venkatram Reddy, Damodar Reddy, have been given cabinet posts, D Srinivas has been made a minister of state. While Jalagam Prasada Rao, son of former chief minister Jalagam Vengal Rao has been elevated to the cabinet rank, P V Ranga Rao, son of the prime minister, has been made a minister of state. Ranga Rao who had been in political oblivion for various reasons for a decade-and-half had staged a 'spectacular' come-back in the 1989 assembly elections. Also eliminated is the 'centre' faction of P Shiv Shankar, a close aide of Rajiv Gandhi and his mother, who of late

has been in the political doghouse. Shiv Shankar's ambitious son P Sudhir Kumar, the Malakpet ML A whose name figured prominently in the December 1990 communal riots and the recent attacks on the opposition party leaders' properties in the wake of Rajiv Gandhi's assassination has also been kept out of the expanded ministry. With 30 cabinet ministers and eight ministers of state, the ministry is one of the largest the Congress(I) had so far in the state but that fact does not seem to worry the CM a whit. Instead, when the exclusion of representation from certain districts and castes despite the large size of the ministry was queried the CM promptly replied that there would be no more expansion to include 'all', after the budget session. He further maintained that the recommendations of the Administrative Reforms Commission (headed by Morarji Desai) on the size of the cabinet are outdated as the workload of contemporary cabinets had increased 'enormously'.

Caste wise as usual the upper castes dominate the list with 14 Reddys, four Kapus, three Kammars, two Kshatriyas, and one each from among the Brahmins, Vaisya and Velama communities. The minorities (Muslim) have also a candidate. Now, in the 180-strong Congress legislature party, there are 125 forward caste people with 65 belonging to the Reddy community forming a little more than 30 per cent of the total MLAs. Similarly with 14 cabinet ministers, they occupy more than 30 per cent of the ministerial berths. Important and prestigious departments have been cornered by the upper caste people. While the chief minister retains to himself excise, higher education, power, services, law and order, finance has been given to his trusted follower S Santosh Reddy. While 'non-prestigious' departments like social welfare, women's welfare and backward classes welfare have been given to BC and SC people, home, finance, medical and health, industries, commercial taxes, school education, courts, civil supplies have gone to upper caste people, mostly Reddys. The composition of the reconstituted ministry shows that the facade of equality in accommodating various communities which to some extent was prevalent in the Congress(I) before it was ousted from power by Telugu Desam in 1983 has been given up now. This is understandable as most of the candidates who were given tickets in the 1989 assembly poll belonged to the forward castes, especially Reddy.

Of those kept out of the ministry are senior leaders like Nadendla Bhaskar Rao, Kudupudi Prabhakar Rao, Sripada Rao, Koneru Ranga Rao, Battina Subba Rao and K L Krishna Murthy. The omission of K L Krishna Murthy, a BC leader who had defected to the Congress(I) from Telugu Desam after a tiff with NTR three years ago is all the more glaring. His exclusion indicates the rising clout of Kotla Vijayabhaskar Reddy, his arch enemy in his native Kurnool district. By giving the home portfolio to M V Mysore Reddy, known not only for his lung power in the assembly but also muscle power outside, Janardhan Reddy had made sure that the dissident leader YSR is checkmated in the state political conundrum.

The selection also assumes political significance as the election to the Cuddapah Lok Sabha seat where YSR was contesting in the recent Lok Sabha poll was countermanded due to the killing of an independent candidate. Many believe that the postponement of the election ordered just a few hours before the scheduled time was done at the behest of the chief minister with an ulterior political

motive By including Chenna Reddy's hatchetmen, D K Samara Simha Reddy, K Rosiah, R Chenga Reddy, Uma Venkatram Reddy and Damodar Reddy the chief minister appears to have come to terms with his political opponent as his mentor Rajiv Gandhi is no more The inclusion of P V Ranga Rao is a foregone conclusion considering the support the chief minister receives from the prime minister for his political survival A new group under Vijayabhaskara Reddy which so far had not been 'recognised' is awarded plum posts With this he appears to have swung back to political centrestage after the party under his leadership had faced a disastrous defeat at the hands of Telugu Desam eight years ago The boycott of the swearing in ceremony of the new ministry by the PCC(I) chief V

Hanumantha Rao, a BC leader, indicates the general disenchantment of the weaker sections with the new set-up

Though Janardhan Reddy has got a brief lease of life with the expansion of the ministry, dissidence under YSR goes on merrily It appears that YSR has almost decided not to contest from Cuddapah Lok Sabha seat where election is to be held later this month but instead 'enter' state politics at an 'appropriate' time "to teach the chief minister a lesson" True to Congress(I) politics of 'succession' and heredity, he appears to have 'finalised' the candidature of his brother in law for the Cuddapah seat How long Janardhan Reddy retains his power is anybody's guess, knowing the track record of the state Congress(I) indulgence in infighting, factionalism and casteism

Beautifying Bombay at Cost of Poor

P A Sebastian

The recently published legislation to regulate development in Bombay city is a sell-out to vested interests

THE Development Control Regulations for Greater Bombay was published on February 20, 1991 and came into force on March 25 There has been very little debate about the DC regulations even though it is of enormous significance to the citizens of the metropolis

The Maharashtra Regional and Town Planning Act was enacted in 1966 with a view to planning the development and use of land in the city, as also in other regions The first development plan was launched in 1967 The development plan for the city comprises two documents A map which delineates the areas and zones for different things such as industry, commerce, residence, etc, and the regulations which verbally set out the plan The plan is due for revision every ten years, according to the act Thus the second development plan which has been brought into effect now should have begun in 1977 In the interregnum, there has been spasmodic tinkering in accordance with arbitrary requirements and the expediency of the powers that be Politicians and bureaucrats have themselves erected skyscrapers with FSI of 3.5 in the southernmost tip of the city in total disregard of the parameters of a planned development

The new Development Control Regulations is of a piece with the current philosophy of the government It has legalised and legitimised the needs and wants of the power wielders, power brokers and their entrepreneurial backers For instance, the normal FSI for the island city is 1.33 and for the suburbs one But the exceptions granted to the normal rule

of FSI may cover more area than the normal rule, which makes a mockery of planning itself

The government itself admits that 26 sq km of the city is occupied by slums The owners and developers of the land on which the slums are located may be granted a total floor space index of up to 2.5 a part of which may be used to accommodate the slum dwellers Even if all the people in a slum are provided with residences FSI of more than one is not needed The developers and owners can sell the rest of the FSI, which is 1.5, in the open market One square foot of built up area may fetch about Rs 1,500 in the open market The cost of construction per sq ft varies between Rs 200 and Rs 300 which means a profit of about 400 per cent The justification of the government proposing such a scheme is that it will encourage builders to take up such schemes which will house the slum-dwellers in properly constructed buildings and thereby eradicate the slums

Is this a possibility? According to the government 55 per cent of Bombayites stay in slums This comes to about six million people Several European countries have a total population of less than six million and they have had to spend billions of dollars to accommodate people at the level of ordinary human existence What rational person says that a handful of builders in Bombay can house six million people in well constructed buildings? The whole proposition is absurd and the public posture of the government in this respect is ques-

tionable because there is no connection between the publicly declared objective and the potentiality of the scheme

Besides, experience shows that even in the few cases in which such buildings are constructed, genuine slum-dwellers will be forced by builders and their musclemen to sell their places for a paltry sum, and quit It may also be beyond their means to maintain such places In all probability, they will go and set up another slum at another place The alternative to slums in cities like Bombay lies, in the long run, in the Indian villages In the short run, they be provided with 'sites and services' which will be habitat friendly to them

The second significant feature of the DC regulations is the scheme for dismantling all the cotton textile mills in the city and/or shifting them outside the city Clause 58 of the DC regulations is an incentive to the owners of the mills to do the same This has great significance vis a vis Bombay and its political configuration Mill workers were the most militant and organised force in the city who fought against the British When Lokmanya Tilak was arrested in 1906, they called for a strike which paralysed the city If the agitation for Samyukta Maharashtra was successful the credit goes to the textile workers of Bombay It is they who faced the bullets The new Development Control Regulations will wipe out the textile mills from the city within a matter of few years and thereby the most potentially radical force of the city

The entire open land and built up area of the premises of a sick or closed textile mill can be used under the DC regulations as follows About one third of the area for purposes like recreation grounds, another one third by the Maharashtra Housing and Area Development Authority or public sector undertakings and the rest is for residential or commercial users The owner of the land and the premises is entitled to the grant of transferable development rights in the case of first two categories This effectively means that the textile mill owners can encash their open land and premises at the market price This is nothing other than a call to the mill owners to close the mills and dispose of the lands and the premises Then what happens to 2,00,000 workers?

The loss of employment will force textile workers to leave their residences as well and reduce them to the level of slum-dwellers or force them to leave Bombay altogether and go to their ancestral villages It is not accidental that all star-rated category residential hotels have been granted an extra FSI of 50 per cent in F and G wards where the textile mills are concentrated In a few years, the whole area will lose its historical identity and will

become one of the posh areas of the city where the affluent have their commercial offices, hotels and residences. But there is no alternative plan to re-employ and re-accommodate that textile workers who will be rendered jobless as well as homeless.

The third important feature of the DC regulations pertains to the scheme to issue Development Right Certificates which can be negotiated in the market with the endorsement of the BMC commissioner. In certain circumstances the development potential of a plot of land may be separated from the land itself and may be made available to the owner of the land in the form of transferable development rights. The DRCs embody these development rights. The DRCs may be issued in respect of land on which there is a slum and the owner of which undertakes to develop it, in respect of mill lands and in respect of other lands reserved for public purposes. In the near future, there may be DRCs worth crores of rupees which will constitute a parallel economy.

The BMC commissioner and his minions have been given enormous discre-

tionary powers. How many slum dwellers will be accommodated in a newly developed plot of land and at what cost, which, textile mill lands will be disposed of and how this will be done, the magnitude of public facilities which the owner of a plot of land must construct to entitle him to DRCs, etc., will be decided by the commissioner. This will be a fertile source of corruption and abuse of power from where huge sums of black money will be generated. Land is the most precious commodity in the city.

The development plan which has such far-reaching consequences was prepared and finalised, under delegated legislation, by a group of bureaucrats with the approval of a few politicians. It was not laid before the legislative assembly for debate and sanction as it should have been done. A full fledged debate in the assembly would have highlighted the salient features of the DC regulations and set in motion a popular debate.

The DC regulations may make Bombay more beautiful but it will be at the cost of the poor and the deprived as in the case of New Delhi and Chandigarh.

Significant Victory on Minimum Wages

Bharat Dogra

One of the worst aspects of the violation of minimum wage laws in the country is that the government itself violates this legislation frequently, especially in the case of workers toiling at various rural employment sites. A report from Rajasthan

LAST year an organisation of peasants and workers called Mazdoor Kisan Shakti Sangathan (MKSS) launched a movement against violation of minimum wage laws in rural employment works in the Bhim region of Udaipur district culminating in a hunger strike cum dharna. The administration succeeded in breaking up the strike using false promises, but the movement succeeded in drawing attention to the issue of non-payment of minimum wage at rural employment works. This led to a two-day discussion on the question of minimum wages in government sponsored rural employment programmes which was organised at the Institute of Development Studies in Jaipur. Senior officials, academicians and social workers who participated in this discussion resolved that minimum wages should be paid in all government sponsored employment works including famine relief works, and that too, within a week of completion of the muster-roll.

This meeting gave strength to the struggle of the MKSS and its activists were hopeful that the revised minimum wage

of Rs 22 would be paid henceforth. However, when work on Jawahar Rozgar Yojana started at 13 places in Barar panchayat, it was seen that payment at much below the minimum wage rate was the general norm and in fact no worker was being paid the legal minimum wage of Rs 22. Several workers made requests for proper measurements to be taken and when this was not done, they refused to accept the lower than minimum wage. However, several workers were ultimately forced to accept a lower wage due to their precarious economic condition and the immediate need for cash. The final confrontation was confined to 12 workers who steadfastly refused to accept anything less than the legal minimum.

Meanwhile Udaipur district was divided into two parts and the Bhim region now came under a newly formed district called Rajsamand. This gave a pretext to officials to refer matters back to the old district, and thereby to delay all decisions.

Officials were quite willing to make an off-the-record extra payment to the 12 workers who had refused to accept the low

wage, and thereby to reduce the matter to one concerning only a dozen persons. For the MKSS, however, it was of crucial importance to get this extra payment on official record, so that this decision would prove helpful for similar struggles. It was in making the payment on record that the officials faltered, appearing to agree sometimes and then backing out. Finally the MKSS had to resort to another dharna-cum fast unto death in Bhim in the first week of May.

By now the decision-making appears to have passed from the hands of the local officials to state level officials. Once again the state government adopted an arrogant and indifferent attitude. In a particularly glaring act of ruthlessness and insensitivity, the government sent a large number of policemen to forcibly lift the five hunger strikers and carry them to a hospital a long distance away. While the reason given was that their lives had to be saved, in reality some of them were denied even water for a long time.

Finally what appears to have changed the heartlessness of Rajasthan government was the firm stand taken by the department of rural development, in Delhi. The state government was not only asked to pay minimum wages, but was further told that its grants for JRY would be held up if it failed to do so.
